pharmacognosy the study of crude drugs of natural origins. —**pharmacognostic** *adj.*

pharmacokinetics *functioning as sing.* the branch of pharmacology dealing quantitatively with the movement of drugs within the body, i.e. with the absorption, distribution, metabolism, and elimination of drugs. —**pharmacokinetic** *adj.*; **pharmacokinetically** *adv.*

pharmacological or (*esp. US*) **pharmacologic 1** of, pertaining to, or used in pharmacology. **2** (of an effect of a naturally occurring agonist) caused by an unphysiological concentration; (of a concentration or dose of a naturally occurring agonist) having an unphysiological effect. —**pharmacologically** *adv.*

pharmacology the science or study of drugs – their origin, characteristics, identification, biological effects, and modes of action. *Distinguish from pharmacy.*

pharmacophore the cluster of atoms in a drug that endows it with its pharmacological properties.

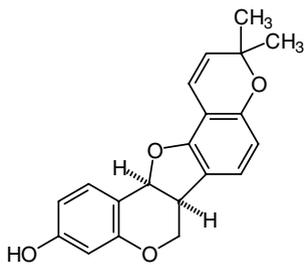

pharmacopoeia or (*US, sometimes*) **pharmacopeia 1** an authoritative book, often an official one, containing descriptions of medicinal drugs with their uses, preparation, methods of assay, formulae, dosages, etc. **2** the whole range of medicinal drugs in use or available. —**pharmacopoeial** or **pharmacopoeic** *adj.*

pharmacy 1 or **pharmaceutics** the practice of preparing and dispensing drugs. **2** a dispensary (for drugs). *Distinguish from pharmacology.*
pharming the production of medicinally active substances by genetic manipulation of farm animals or plants. [From a combination of 'pharmaceutical' and 'farming'.]

phase 1 any distinct or characteristic period or stage in a sequence of events, occurrences, or processes, whether cyclical or unidirectional; e.g. the phases in the life cycle of an organism or the phases of the **cell-division cycle** (see also **anaphase**, **gap phase**, **metaphase**, **prophase**, **telophase**). **2** (in physical science) **a** the totality of those parts of a heterogeneous material system that are identical in chemical composition and physical state, and that are separated by an interface from the rest of the system; e.g. solid, liquid, or vapour phases, or the discrete phases into which immiscible liquids separate after mixing, etc. See also **epiphase**, **hypophase**, **liquid-crystalline phase**, **phase transition**. **b** a particular stage in the cycle of a periodic phenomenon, process, or quantity; the fraction of such a cycle that has been completed at a specific reference time, expressed in circular measure (or its equivalent in angular degrees). Two or more waveforms (or two or more similar sequences of events, etc.) that are in corresponding phases at the same time are described as 'in phase', while ones not exhibiting such correspondence are described as 'out of phase'. —**phasic** *adj.*

phase-contrast microscopy or **phase microscopy** a form of light microscopy in which a colourless object having a different refractive index from that of the medium is viewed by converting differences in refractive index into visible differences in light intensity. The technique takes advantage of the quarter-wave retardation of the illuminating light that occurs on its diffraction by the object, imposes a similar change of phase on the undiffracted light, and forms an image by interference between the two beams of light.

phaseolin 1 a crystallizable globulin found in seeds of the kidney bean, or French bean, *Phaseolus vulgaris*, and the lima bean, *Phaseolus lunatus*. It is a major seed-storage protein. α and β types are known. **2** a former name for **phaseolin**. **3** an alternative name for **legumain**.

phase rule a generalization, valuable in the study of equilibria between **phases** (def. 2), expressed by the equation:

$$F = C - P + 2$$

where C is the number of chemically distinguishable components present, P is the number of phases in equilibrium, and F is the number of degrees of freedom of the system, i.e. the number of independently variable intensive properties that must be specified in order to describe completely the state of the system.

phaseshift mutation an alternative term for **frameshift mutation**.

phase transition (of lipids) the transition of a lipid between any of the various phases it can adopt. The transition is dependent on factors such as temperature, purity of the lipid, state of hydration, and, if not pure, the composition of the mixture. In the nonhydrated state, a crystalline polar lipid can on heating, prior to a complete melting, adopt a **liquid-crystalline phase**, in which the polar groups are still associated in sheets, so that the overall structure consists of lipid bilayers, but the fatty-acyl chains undergo increased thermal vibrations leading to considerable disorder; the temperature at which this transition occurs is known as the **phase-transition temperature**. In the presence of water, below the phase-transition temperature, phospholipids adopt a gel phase, in which

water penetrates between the sheets of polar headgroups, but the fatty-acyl chains are highly ordered. On increasing the temperature through the phase-transition temperature, the lipid adopts a hydrated liquid-crystalline phase with disordered fatty-acyl chains. The term **fluidity** has been used to provide a qualitative description of these changes, the bilayer being said to become more fluid as the temperature increases. See also **hexagonal phase**.

phase variation (of flagellin) see **flagellin**.

phasmid 1 a gene-cloning vector consisting of an artificial combination of a plasmid with a phage such that its genome contains functional origins of replication of both; it may thus be propagated either as a plasmid or as a phage in appropriate host strains. A phasmid is formed by insertion of one or more plasmid molecules into a phage genome. Compare **cosmid**, **phagemid**. **2** either of a pair of lateral caudal organs characteristic of parasitic nematodes of the class Phasmida; they are thought to function as chemoreceptors. **3** any plant-eating insect of the order Phasmida, which includes leaf insects and stick insects.

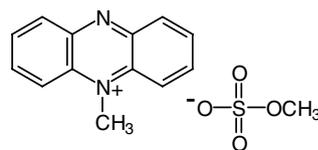

PhD enzyme a phospholipase D enzyme belonging to a family characterized by the HKD catalytic motif (i.e. HXXK₄DX₆GG/S, using the single-letter code for amino acids). PhD enzymes are present in certain viruses and in bacteria, fungi, plants, and animals.

PHD finger *abbr. for* plant homeodomain zinc finger; a particular type of zinc finger, widely distributed in eukaryotes and found in many chromatin regulatory factors. It is characterized by a C4HC3-type motif, and adopts a dimetal(zinc)-bound $\alpha+\beta$ fold. This fold is highly similar to that found in another class of zinc finger domains, which function in membrane recruitment of cytosolic proteins by binding to phosphatidylinositol 3-phosphate.

PH domain *abbr. for* pleckstrin homology domain.

Phe *symbol for* a residue of the α -amino acid L-phenylalanine (alternative to F).

phenazine methosulfate *abbr.:* PMS; *N*-methylphenazonium methosulfate; 5-methylphenazinium methyl sulfate; [C₁₃H₁₁N₂]⁺[CH₃SO₄]⁻; an artificial electron carrier, E⁰ = +0.080 V, useful in the study of redox enzyme systems.

phencyclidine 1-(1-phenylcyclohexyl)piperidine (*abbr.:* PCP); a potent psychotomimetic agent, known to drug users as angel dust, with analgesic and anesthetic actions. It acts as a ligand for the **sigma receptor** and is a blocker of the NMDA-receptor ionophore (see **glutamate receptor**). A controlled substance in the US Code of Federal Regulations.

phene any phenotypic character under genetic control.

phenelzine β -phenylethylhydrazine, (2-phenethyl)hydrazine; a non-selective monoamine oxidase inhibitor used as an antidepressant.

phenobarbital 5-ethyl-5-phenylbarbiturate; a major **barbiturate** drug.

phenocopy a nonhereditary modification of the phenotype of an organism, induced by nutritional or other environmental factors, that mimics a phenotype controlled by a specific gene.

phenol 1 the common and trivial name for hydroxybenzene, C₆H₅OH. **2** any compound containing one or more hydroxyl groups directly attached to an aromatic carbocycle. Unlike hydroxy-alkyl compounds, phenols are weakly acidic.

phenolase 1 an alternative name for **catechol oxidase** (EC 1.10.3.1).

2 an alternative name for **monophenol monooxidase** (EC 1.14.18.1).

3 more loosely, any enzyme of the sub-subclass 1.10.3. Such enzymes cause browning of damaged plant tissues when they come into contact with flavonoids, as **catechins** are converted into polymerized brown products.

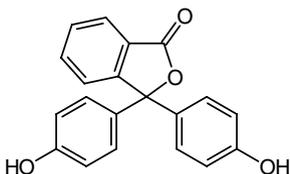

phenol-chloroform extraction a method for the efficient extraction of nucleic acids free from contaminating proteins. Phenol satu-

rated with Tris-EDTA buffer is mixed with an equal volume of chloroform (or sometimes a 24:24:1 v/v/v mixture with isoamyl alcohol) and is shaken to form an emulsion with the solution containing nucleic acids. On phase separation the nucleic acids occupy the upper aqueous phase and denatured protein occurs at the interface.

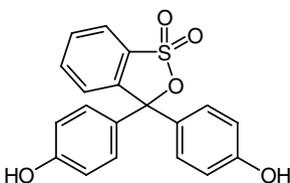

phenolic 1 of, containing, derived from, or having the character of phenol or a phenol. **2** describing a hydroxyl group linked to an aromatic carbocycle.

phenol 2-monooxygenase *see* monooxygenase.

phenolphthalein an indicator dye that changes from colourless to red over the pH range 8.3–10.0. The β -D-glucuronide ($\lambda_{\text{max}} = 420$ nm) is used as a substrate for the assay of β -glucuronidase, hydrolysis leading to release of phenolphthalein, which can be measured in alkaline solution by its red colour ($\lambda_{\text{max}} = 550$ nm).

Phenol Red an indicator dye that changes colour from yellow to red over the pH range 6.8–8.4.

phenome the whole of the phenotypic characteristics of an organism. *Compare* genome. —**phenomic** *adj.*

phenomenology a branch of a science dealing with the description and classification of natural phenomena rather than with their explanation or cause. —**phenomenological** *adj.*

phenon any set of organisms grouped together by the methods of numerical taxonomy.

phenothiazine 1 a chemical structure that forms the basis, by *N*-substitution, of a group of **neuroleptics**, such as **chlorpromazine**. **2** any of the group of drugs based on the phenothiazine structure. The neuroleptic effects are those now most commonly exploited, but antiemetic, antihistamine and anthelmintic effects have also been of use.

phenotype 1 the totality of the observable functional and structural characteristics of an organism as determined by interaction of the genotype of the organism with the environment in which it exists. **2** any particular characteristic or set of characteristics of an organism so determined. **3** a group of organisms exhibiting the same set of such characteristics. *Compare* genotype. —**phenotypic** *adj.*

phenoxide 1 the anion, $\text{C}_6\text{H}_5\text{O}^-$, derived from phenol by the loss of a proton. **2** any salt of phenol.

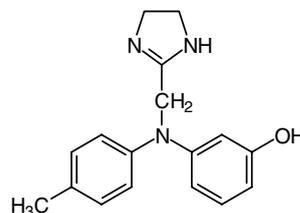

phenoxy *symbol:* OPh or PhO; the $\text{C}_6\text{H}_5\text{O}-$ group, derived from phenol by the loss of a hydrogen atom.

phenotolamine an antagonist for both α_1 and α_2 adrenoceptors. It is an antihypertensive agent and vasodilator.

phenyl *symbol:* Ph; the aromatic carbocyclic group C_6H_5- , derived from benzene.

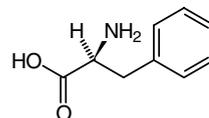

phenylacetaldehyde dehydrogenase EC 1.2.1.39; an enzyme of the pathway of phenylalanine degradation. It catalyses the oxidation by NAD^+ of phenylacetaldehyde to phenylacetate with formation of NADH.

phenylalaninate 1 phenylalanine anion; the anion, $\text{C}_6\text{H}_5-\text{CH}_2-\text{CH}(\text{NH}_2)-\text{COO}^-$, derived from **phenylalanine**. **2** any salt containing phenylalanine anion. **3** any ester of phenylalanine.

phenotolamine

phenylalanine the trivial name for β -phenylalanine; α -aminohydrocinnamic acid; α -amino- β -phenylpropionic acid; 2-amino-3-phenylpropanoic acid; $\text{C}_6\text{H}_5-\text{CH}_2-\text{CH}(\text{NH}_2)-\text{COOH}$; a chiral α -amino acid. L-phenylalanine (*symbol:* F or Phe), (*S*)-2-amino-3-phenylpropanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: UUC or UUU. In mammals, it is an essential dietary amino acid, and is both glucogenic and ketogenic. Residues of D-phenylalanine (*symbol:* D-Phe or DPhc), (*R*)-2-amino-3-phenylpropanoic acid, occur in a number of peptide antibiotics, e.g. bacitracin A, gramicidin S, polymyxins B₁ and B₂, and tyrocidins A, B, and C.

L-phenylalanine

L-phenylalanine ammonia-lyase EC 4.3.1.5; *systematic name:* L-phenylalanine ammonia-lyase; an enzyme, widely distributed in plants, that deaminates L-phenylalanine to *trans*-cinnamic acid, which is rapidly converted to **lignin**, a major polymer of the plant cell wall.

phenylalanine hydroxylase *see* phenylalanine 4-monooxygenase.

phenylalanine 4-monooxygenase EC 1.14.16.1; *systematic name:* L-phenylalanine, tetrahydrobiopterin: oxygen oxidoreductase (4-hydroxylating); *other names:* phenylalanine 4-hydroxylase; phenylalaninase. An iron-containing enzyme that catalyses a reaction between L-phenylalanine, tetrahydrobiopterin, and dioxygen to form L-tyrosine, dihydrobiopterin, and H_2O . It is thus of major importance for the provision of L-tyrosine. Over 400 mutations result in enzyme deficiency in humans and consequent **phenylketonuria**.

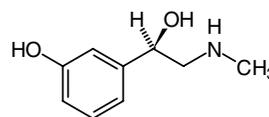

phenylalaninium phenylalanine cation; the cation, $\text{C}_6\text{H}_5-\text{CH}_2-\text{CH}(\text{NH}_3^+)-\text{COOH}$, derived from phenylalanine.

phenylalanino the alkylamino group, $\text{C}_6\text{H}_5-\text{CH}_2-\text{CH}(\text{COOH})-\text{NH}-$, derived from phenylalanine.

phenylalanyl the acyl group, $\text{C}_6\text{H}_5-\text{CH}_2-\text{CH}(\text{NH}_2)-\text{CO}-$, derived from phenylalanine.

phenylalanyl chain (*sometimes*) the **B chain** of any of those species of insulin whose amino-acid sequences were the first to be determined. It was so called by virtue of the N-terminal phenylalanine residue occurring in those instances.

phenylephrine (*R*)-(-)-1-(3-hydroxyphenyl)-2-methylaminoethanol; a highly selective α_1 adrenergic agonist. It is a vasoconstrictor, used in treating hypotension; it also acts as a decongestant.

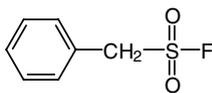

R-(-)-enantiomer
R-(-)-enantiomer

phenylethanolamine *N*-methyl transferase *abbr.*: PNMT; EC 2.1.1.28; an enzyme catalysing *N*-methylation of norepinephrine in the synthesis of epinephrine. *s*-adenosyl methionine is the methyl donor.

phenylhydrazone any condensation product of the type $R^1R^2C=N-NHC_6H_5$, formed between carbonyl compounds of the general formula $R^1R^2C=O$ and phenylhydrazine. Phenylhydrazones, in particular 2,4-dinitrophenylhydrazones, are useful in the characterization of aldehydes and ketones. *See also phenylosazone.*

phenylketonuria (*abbr.*: PKU) or **phenylpyruvic oligophrenia** an autosomal recessive inherited disorder of phenylalanine metabolism characterized by the presence of phenylpyruvate in the urine and excessively high levels of phenylalanine and its metabolites in the blood and tissues. It can be treated by restricting the amount of phenylalanine in the diet. If untreated in young children, severe mental retardation occurs. This form, **classical phenylketonuria**, is due to the absence or deficiency of **phenylalanine 4-monooxygenase**, an enzyme that uses tetrahydrobiopterin as second donor. Hyperphenylalaninemia also results from deficiency in dihydropteridine reductase (EC 1.6.99.7) or phenylalanine(histidine) aminotransferase (EC 2.6.1.58).

phenylmethylsulfonyl fluoride or **phenylmethanesulfonyl fluoride** *abbr.*: PMSF; an inhibitor of serine proteases; it is highly toxic, but less so than diisopropylphosphofluoridate. PMSF is insoluble and unstable in aqueous solutions, so is usually dissolved in dioxan. It inhibits trypsin and chymotrypsin irreversibly, sulfonylating the active-site histidine, but does not inhibit cholinesterase. *See also aminoethylbenzenesulfonyl fluoride.*

phenylosazone any 1,2-bis(phenylhydrazone); i.e., any condensation product of the type $C_6H_5NH-N=CR^1-CR^2=N-NH-C_6H_5$ formed between an α -dicarbonyl compound of the general formula $R^1-CO-CO-R^2$ and phenylhydrazine; α -hydroxy- and α -amino-carbonyl compounds will also form phenylosazones through oxidation of the corresponding [mono]phenylhydrazones initially formed. Phenylosazones, in particular 2,4-dinitrophenylosazones, are useful in the characterization of aldehydes and ketones, especially monosaccharides. *See also phenylhydrazone.*

phenylpropanoid any substance in plants derived from phenylpropane units variously linked and interlinked to form polymers of high molecular mass, especially **lignins**.

phenylpyruvate decarboxylase EC 4.1.1.43; an enzyme of the pathway of phenylalanine degradation. It catalyses the formation of phenylacetaldehyde from phenylpyruvate with release of CO_2 .

phenylpyruvic oligophrenia an alternative name for **phenylketonuria**.

pH 5 enzyme a protein fraction from rat liver, soluble at pH 7 and isolated by precipitation at pH 5, that was used in early studies of protein biosynthesis *in vitro*. It is now known to be a mixture of amino acid-tRNA ligases.

pheo+ or (*esp. Brit.*) **phaeo+** *comb. form* denoting dark-coloured.

pheochromocytoma or (*esp. Brit.*) **phaeochromocytoma** or **chromaffinoma** a tumour of tissues derived from embryological neuroectoderm, often of the adrenal medulla. It is characterized by its ability to synthesize and secrete catecholamines, often in excessive amounts. The tumour cells commonly show a strong **chromaffin** (or pheochrome) reaction.

pheofarnesin or (*esp. Brit.*) **phaeofarnesin** any pigment derived by demetallation of a chlorophyll in which the 17-propionic-acid group is esterified with farnesol.

pheomelanin or (*esp. Brit.*) **phaecomelanin** a red and/or yellow pigment produced in mammalian melanocytes from tyrosine and cysteine. It is formed as an alternative to eumelanin by switching of the melanogenesis pathway at the dopaquinone stage. How the switch operates is unclear.

pheophorbide or (*esp. Brit.*) **phaeophorbide** any pigment derived

by removal of metal from a chlorophyll in which the 17-acrylic-acid or 17-propionic-acid group is unesterified or has been de-esterified.

pheophytin or (*esp. Brit.*) **phaeophytin** any pigment derived by removal of metal from a chlorophyll in which the 17-propionic-acid group is esterified with phytol.

pheromone a substance, or characteristic mixture of substances, that is secreted and released by an organism and detected by a second organism of the same or a closely related species, in which it causes a specific reaction, such as a definite behavioural reaction or a developmental process; a type of **ectocrine**. The mating pheromones of fungi and insects are examples. *Compare allomone, kairomone.*

pheromone-binding protein any of a group of insect proteins that bind to, and thus solubilize, **pheromones**, which are typically hydrophobic.

pheromone receptor a fungal transmembrane G protein-coupled receptor.

PHEX *abbr. for* phosphate-regulating gene with homologies to endopeptidases on the X chromosome; a putative endopeptidase that is mutated in X-linked hypophosphatemia. *See fibroblast growth factor-23.*

PHHI *see* sulfonylurea receptor.

phi *symbol:* ϕ or ϕ (lower case) or Φ (upper case); the twenty-first letter of the Greek alphabet. For uses *see* Appendix A.

PHI or **PHI-27** *abbr. for* peptide HI.

PHI-BLAST *abbr. for* pattern hit initiated-BLAST; *see* database-search program.

Philadelphia chromosome (Ph¹) a specific chromosomal abnormality in the blood cells of patients with chronic myeloid leukemia. It usually results from a fusion of *bcr* on chromosome 22 with *c-myc* (*see MYC*) on chromosome 9 leading to expression of the latter. The Philadelphia chromosome is a very small chromosome consisting of the short arm and a small piece of the long arm of chromosome 22 fused to a short piece from the end of the long arm of chromosome 9 (the modified chromosome 9 that results being called 9q⁺). It is named after the city in which it was first recorded. *See also abl.*

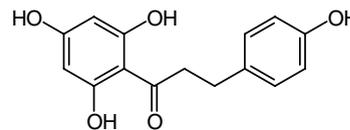

philosin a pore-forming toxin with approximately 100 amino acid residues, produced by the ant *Myrmecia pilosula*. It is classified in the TC system under number 1.C.51.

pH indicator *see* indicator (def. 3), **mixed indicator**.

phi X174 or ϕ X174 a single-stranded DNA bacteriophage that infects *Escherichia coli*. It contains 5386 nt and was the first DNA to be sequenced, by British biochemist Frederick Sanger (1918–) in 1976.

phloem the main food-conducting tissue of plants, via which nutrients and photosynthate are conveyed between different sites. Phloem comprises two types of cells: sieve-tube elements, which are joined end-to-end to form sieve tubes; and adjacent companion cells. *Compare xylem.*

phloretin 3-(4-hydroxyphenyl)-1-(2,4,6-trihydroxyphenyl)-1-propanone; the aglycon of **phlorizin**, with which it shares many biochemical and pharmacological properties.

phlorizin or **phlorhizin** or **phloridzin** or **phlorrhizin** phloretin-2'- β -glucoside; a dihydrochalcone glucoside occurring in all parts of the apple tree except the mature fruit. It inhibits intestinal and renal glucose- Na^+ cotransporters, the mediated transport of glucose into erythrocytes and hepatocytes, the glucose 6-phosphate transporter in hepatocytes, and photophosphorylation. It is used experimentally to produce glucosuria.

phloroglucinol 1,3,5-trihydroxybenzene; 1,3,5-benzenetriol; a compound that is useful as a reagent for the qualitative detection of pentoses and pentosans; when these are boiled with a solution of

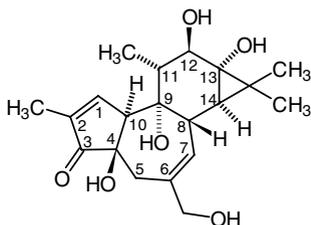

phloroglucinol in hydrochloric acid, a cherry-red colour is produced. Galactose also reacts in this way.

phlorrhizin a variant spelling of **phlorizin**.

pH meter any instrument for determining pH potentiometrically, usually with a glass electrode plus a calomel reference electrode, or with a combination electrode.

phoA the gene for *E. coli* alkaline phosphatase. The signal sequence of PhoA may be incorporated in expression vectors used for secretion of foreign proteins into the periplasmic space of *E. coli*.

phorbol a complex tetracyclic compound, C₂₀H₂₈O₆, based on a cyclopropabenzazulene skeleton. Various **phorbol esters** occur in croton oil (from *Croton tiglium*, of the family Euphorbiaceae, hence the name) and act as potent **cocarcinogens**.

phorbol ester any esterified form of **phorbol**. Several phorbol esters possess activity as tumour promoters and activate the mechanisms associated with cell growth. These actions have been widely attributed to the activation of protein kinase C, probably by substituting for diacylglycerol. A much-studied ester is phorbol 12-myristate 13-acetate (PMA; or 12-*O*-tetradecanoyl-phorbol-13-acetate, TPA); other active esters include phorbol 12,13-dibutyrate (PDBu) and phorbol 12,13-didecanoate (PDD). Activity depends on the β -configuration of the hydroxyl at C-4. Several 4α -phorbol esters have been utilized in control studies.

+phore noun suffix denoting something, especially a chemical substance or group, that carries or produces; e.g. ionophore, chromophore.

+phoresis noun suffix denoting carriage of molecular entities by some agency; e.g. electrophoresis, ionophoresis.

phosducin a protein that binds the β and γ subunits of **transducin** in outer and inner segments of retinal rod cells. Light-induced changes in cyclic nucleotide levels modulate the phosphorylation of phosducin by cyclic AMP kinase.

+phosph+ a variant form of **+phospho+** (sometimes before a vowel).

phosphacan a chondroitin sulfate proteoglycan of brain that interacts with neurons and neural cell-adhesion molecules. It is an extracellular variant of a receptor-type protein tyrosine phosphatase.

phosphagen any of a group of guanidine phosphates that occur in muscle, and can be used to regenerate ATP from ADP during muscular contraction by a reaction catalysed by **creatine kinase**, or by an analogous enzyme of sub-subclass EC 2.7.3. Included in the group are phosphoagmatine (see **agmatine**), **phosphoarginine**, **phosphocreatine**, **phosphoglycocyanine** (see **glycocyanine**), **phospholombricine** (see **lombricine**), **phosphooctopine** (see **octopine**), and **phosphotaurocyanine** (see **taurocyanine**).

phosphataemia a variant spelling (esp. Brit.) of **phosphatemia**.

phosphatase or **phosphomonoesterase** any phosphoric monoester hydrolase of sub-subclass EC 3.1.3. Some phosphatases are very specific while others are relatively unspecific. See also **acid phosphatase**, **acylphosphatase**, **alkaline phosphatase**, **fructose-bisphosphatase**, **glucose-1-phosphatase**, **glucose-6-phosphatase**, **inorganic pyrophosphatase**, **protein phosphatase**.

phosphatased a jargon term indicating dephosphorylated by treatment with a **phosphatase**.

phosphatase inhibitor protein an inhibitor of protein phosphatase 1 (see **protein phosphatase**) involved in the regulation of glycolysis; it is itself a phosphoprotein.

phosphate 1 the trivalent anion, PO₄³⁻, derived from phosphoric

acid; orthophosphoric acid; tetraoxophosphoric(v) acid; PO(OH)₃. 2 any mixture of [ortho]phosphoric acid and its anions. Once widely used in the laboratory as a buffer in the physiological range of pH values; pK_{a2} (37°C, 0.05 mol L⁻¹) = 6.84. 3 any (partial or full) salt or ester of [ortho]phosphoric acid. Phosphate salts and esters play key roles in the structure and function of all forms of life. 4 any anion or salt of a mixed anhydride of [ortho]phosphoric acid with another acid; e.g. acetyl phosphate (i.e. acetic phosphoric anhydride). 5 the univalent group -O-P(O)(OH)₂ (irrespective of its state of ionization). See also **diphosphate**, **inorganic phosphate**, **metaphosphate**, **pyrophosphate**, **triphosphate**.

phosphate bond 1 an ester linkage in a phospho[mono]ester, phosphodiester, or phosphotriester. 2 an anhydride linkage in a phosphoric anhydride. 3 the connecting phosphoric residue in a phosphodiester.

phosphate bond energy a term formerly and incorrectly used for the **bond energy** (def. 2) of a **phosphate bond** (def. 1, 2).

phosphatemia or (esp. Brit.) **phosphataemia** the level of **phosphate** (def. 2) in the blood; in human plasma its normal range is 0.8–1.4 mmol L⁻¹. The level is regulated by **calcitriol**, which stimulates absorption of dietary phosphate as well as calcium, and by **parathyrin**, which decreases phosphate resorption by the kidney. Calcitriol also stimulates bone resorption, which tends to lower the plasma phosphate level, but in states of hypervitaminosis D the effect on the gut predominates and the plasma level is increased. See also **hyperphosphatemia**, **hypophosphatemia**.

phosphate potential the concentration of ATP in any system divided by the product of the concentrations of ADP and inorganic phosphate in that system. Compare **adenylate energy charge**.

phosphatidal a former term for **plasmenyl**.

phosphatidate any anion, salt, or ester of a **phosphatidic acid**.

phosphatidate cytidyltransferase EC 2.7.7.41; *systematic name*: CTP:phosphatidate cytidyl transferase; *other names*: CDP-diglyceride synthetase; CDPdiglyceride pyrophosphorylase. An enzyme that catalyses a reaction between CTP and phosphatidate to form pyrophosphate and CDPdiacylglycerol. It is an integral membrane protein of the endoplasmic reticulum; it forms the intermediate involved in the synthesis of, e.g., phosphatidylinositol, by reaction with inositol, or phosphatidylserine, by reaction with serine.

phosphatidate phosphatase EC 3.1.3.4; *systematic name*: 3-*sn*-phosphatidate phosphohydrolase; an enzyme that removes phosphate from phosphatidic acid to yield an *sn*-1,2-diacylglycerol.

phosphatide an old term, no longer recommended for **glycerophospholipid**.

phosphatidic acid any derivative of glycerol phosphate in which both the remaining hydroxyl groups of the glycerol moiety are esterified with fatty acids; the commonest are derivatives of *sn*-glycerol 3-phosphate.

phosphatidyl *symbol*: Ptd; an acyl group derived from a **phosphatidic acid**.

phosphatidylcholine *abbr.*: PC; any glycerophospholipid in which a phosphatidyl group is esterified to the hydroxyl group of **choline**. Phosphatidylcholines are important constituents of cell membranes and lipoproteins.

phosphatidylcholine desaturase EC 1.3.1.35; *other names*: oleate desaturase; linoleate synthase; an enzyme in plants that catalyses the reaction:

phosphatidylcholine-dolichol *O*-acyltransferase see **lecithin-cholesterol acyl transferase**.

phosphatidylcholine-sterol *O*-acyltransferase EC 2.3.1.43; *other names*: lecithin-cholesterol acyltransferase (*abbr.*: LCAT); phospholipid-cholesterol acyltransferase; a plasma enzyme that catalyses the transfer of a fatty-acyl group from phosphatidylcholine to a sterol to form a sterol ester and 1-acylglycerophosphocholine. In mammals it is important in plasma lipoprotein metabolism, particularly in esterifying cholesterol, which is then transferred to very-low-density lipoprotein as cholesteryl ester. Compare **sterol O-acyltransferase**.

phosphatidylethanolamine *abbr.*: PE; any glycerophospholipid

in which a phosphatidyl group is esterified to the hydroxyl group of **ethanolamine**. Phosphatidylethanolamines are important constituents of cell membranes.

phosphatidylinositol *abbr.*: PI; *symbol*: PtdIns; 1-(3-*sn*-phosphatidyl)-1d-*myo*-inositol; *the recommended name for any glycerophospholipid in which its sn-glycerol 3-phosphate residue is esterified to the 1-hydroxyl group of 1d-myo-inositol*. The older term **phosphoinositide** is now used as a generic term for any inositol-containing glycerophospholipid. The corresponding names for the monophosphorylated and diphosphorylated derivatives of phosphatidylinositol are **phosphatidylinositol 4-phosphate** and **phosphatidylinositol 4,5-bisphosphate**, respectively. The older names diphosphoinositide and triphosphoinositide for these derivatives are no longer used.

phosphatidylinositol 4,5-bisphosphate *or (formerly) triphosphoinositide* *abbr.*: PIP₂ or PI-4,5-P₂; *symbol*: PtdIns(4,5)P₂ or PtdIns-4,5-P₂; 1-(3-*sn*-phosphatidyl)-1d-*myo*-inositol 4,5-bisphosphate; any glycerophospholipid in which a phosphatidyl group is esterified to the 1-hydroxyl group of 1d-*myo*-inositol 4,5-bisphosphate.

1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase *see phospholipase*.

phosphatidylinositol cycle *or (formerly) phosphoinositide cycle* a metabolic cycle that mediates the actions of various hormones and other effectors at the membranes of mammalian cells. Binding of an effector to its specific receptor at the membrane causes a G-protein-coupled stimulation of a phospholipase C, called 1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase. This causes hydrolysis of phosphatidylinositol 4,5-bisphosphate, I, to produce the two intracellular messengers inositol 1,4,5-trisphosphate, II, which causes release of calcium ions from intracellular stores, and *sn*-1,2-diacylglycerol, III, which activates protein kinase C. III is then converted via phosphatidate (under the action of **diacylglycerolkinase** and **phosphatidate cytidylyltransferase**) to **CDPdiacylglycerol**, IV, while II is converted via inositol bisphosphate and inositol monophosphate to inositol. Inositol and IV then react together (enzyme is **CDPdiacylglycerol-inositol 3-phosphatidyltransferase**) to form phosphatidylinositol, from which I is regenerated by stepwise phosphorylation by specific kinases to complete the cycle. Alternatively, II may be converted to another messenger, inositol 1,3,4,5-tetrakisphosphate, V, which may be implicated in the influx of extracellular calcium ions; V is then degraded to inositol via inositol 1,3,4-trisphosphate, which is inactive.

phosphatidylinositolglycan the compound in which phosphatidylinositol is linked (6-1 α) to the core glycan GlcN4-1 α Man6-1 α Man2-1 α Man6-P-ethanolamine. Other groups may be attached to the core glycan. It forms the membrane anchor for **PIG-tailed proteins**, in which the protein's C-terminus forms an amide linkage with the phosphoethanolamine moiety. *See paroxysmal nocturnal hemoglobinuria*.

phosphatidylinositol glycan protein *abbr.*: PIG protein; *N*-acetylglucosaminyl-phosphatidylinositol biosynthetic protein; a protein required for synthesis of *N*-acetylglucosaminylphosphatidylinositol, the very early intermediate in the biosynthesis of the **GPI anchor**. Another protein required for this synthesis is PIG-F.

1-phosphatidylinositol 3-kinase EC 2.7.1.137; *systematic name*: ATP:1-phosphatidyl-1d-*myo*-inositol 3-phosphotransferase. An enzyme that catalyses the phosphorylation by ATP of 1-phosphatidyl-1d-*myo*-inositol to form 1-phosphatidyl-1d-*myo*-inositol 3-phosphate with release of ADP. It forms part of the complex that associates on activation of certain growth factor (e.g. PDGF) receptors, binding via SH2 domains (*see SH domain*). The molecule consists of a catalytic subunit (p110) and a regulatory subunit (p85: two forms, α and β , in mammals). p85 mediates association of p110 to the plasma membrane.

1-phosphatidylinositol 4-kinase EC 2.7.1.67; an enzyme involved in the biosynthesis of membrane **phosphoinositides**. It catalyses the phosphorylation by ATP of 1-phosphatidyl-1d-*myo*-inositol to form 1-phosphatidyl-1d-*myo*-inositol 4-phosphate with release of ADP.

phosphatidylinositol-3-phosphatase EC 3.1.3.64; an enzyme that catalyses the hydrolysis of the 3-phosphate from phos-

phatidylinositol-3-phosphate, forming phosphatidylinositol and orthophosphate.

phosphatidylinositol 4-phosphate *or (formerly) diphosphoinositide* *abbr.*: PIP or PI 4-P; *symbol*: PtdIns4P or PtdIns-4-P; 1-(3-*sn*-phosphatidyl)-1d-*myo*-inositol 4-phosphate; any glycerophospholipid in which a phosphatidyl group is esterified to the 1-hydroxyl group of 1d-*myo*-inositol 4-phosphate.

1-phosphatidylinositol-4-phosphate kinase EC 2.7.1.68; *other name*: diphosphoinositide kinase; an enzyme of the pathway for the biosynthesis of membrane **phosphoinositides**. It catalyses the phosphorylation by ATP of 1-phosphatidyl-1d-*myo*-inositol 4-phosphate to form 1-phosphatidyl-1d-*myo*-inositol 4,5-bisphosphate with release of ADP.

1-phosphatidylinositol phosphodiesterase *see phospholipase*.

phosphatidylinositol synthase *see CDPdiacylglycerol-inositol 3-phosphatidyltransferase*.

phosphatidylserine any glycerophospholipid in which a phosphatidyl group is esterified to the hydroxyl group of L-serine. Phosphatidylserines are important constituents of cell membranes.

phosphatidylserine decarboxylase EC 4.1.1.65; an enzyme that converts phosphatidylserine to phosphatidylethanolamine, of major importance in the synthesis of that phospholipid. It consists of an α and β chain, formed by cleavage of a proenzyme.

phosphatidylserine synthase *an alternative name for CDPdiacylglycerol-serine O-phosphatidyltransferase*.

phosphatonin a heat-labile, trypsin-sensitive factor that is presumed to be secreted by some tumours and to increase phosphaturia and produce phosphate wasting.

phosphinothricin *abbr.*: PPT; CH₃PO₂CH₂CH₂CHNH₂COOH; a glutamate analogue herbicide that is relatively nontoxic for animals.

phosphite 1 any anionic form of phosphorous acid; trioxophosphoric(III) acid; P(OH)₃. **2** any mixture of phosphorous acid and its ionized forms. **3** any (partial or full) salt or ester of phosphorous acid.

phosphite-triester method a method for the chemical synthesis of oligonucleotides in which a suitably protected phosphite diester of general formula Nuc-3'-O-P(OR)X, where R is a methyl or another alkyl group, X is a reactive group such as chloro, dimethylamino, or morpholino, and Nuc is a residue of an appropriate nucleoside, is first condensed with the 5'-hydroxyl of a protected nucleoside (usually anchored through its 3'-hydroxyl to an insoluble support) to form a phosphite triester. Sequential addition of further nucleoside units is then carried out in the same way, the phosphite triester formed at each stage being oxidized to the corresponding phosphate triester before the next cycle of reactions. Protecting groups are removed by hydrolysis at the completion of the synthesis.

+phospho+ *or (sometimes before a vowel) +phosph+* (*in chemical nomenclature*) prefix or infix denoting a phosphoric residue linked to one, two, or three heteroatoms in an organic compound. *See also phosphono+*.

phosphoacetylglucosamine mutase EC 5.4.2.3; *systematic name*: *N*-acetyl-D-glucosamine 1,6-phosphomutase; *other name*: acetylglucosamine phosphomutase. An enzyme that catalyses the reaction:

It participates in the formation of UDP-*N*-acetylglucosamine: glucosamine 6-phosphate \rightarrow *N*-acetylglucosamine-6-phosphate \rightarrow *N*-acetylglucosamine-1-phosphate, thence by reaction with UTP to UDP-*N*-acetylglucosamine + pyrophosphate, thence also to sialic acid.

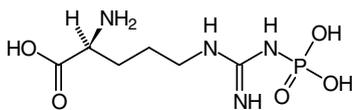

3'-phosphoadenosine 5'-phosphosulfate *an alternative recommended name for adenosine 3'-phosphate 5'-phosphosulfate*.

3'-phosphoadenylyl sulfate *symbol*: PAdoPS; *abbr.*: PAPS; *alternative recommended names for active sulfate*: adenosine 3'-phosphate 5'-phosphosulfate; adenosine 3'-phosphate 5'-P-phosphato-sulfate; 3'-phospho-5'-adenylic sulfuric monoanhydride; a naturally occurring mixed anhydride. It is synthesized from **adenosine 5'-phosphosulfate** by phosphorylation with ATP through the action of

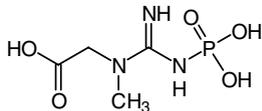

adenylsulfate kinase (EC 2.7.1.25). It is an intermediate in the formation of a variety of sulfo compounds in biological systems. For example, in animals it is involved in sulfate transfer in the formation of sulfatides and in the synthesis of chondroitin sulfate and other sulfated polysaccharides, while in bacteria, by a process analogous to that involving adenosine 5'-phosphosulfate. In plants, it is reduced by phosphoadenyl-sulfate reductase (thioredoxin), EC 1.8.4.8 to yield adenosine 3',5' bis(phosphate) and sulfite. The latter can then undergo further reduction by sulfite reductase to sulfide, from which cysteine may be synthesized.

phosphoamino acid any phosphorylated amino acid. The term often refers to *O*-phosphate esters of residues in proteins, e.g. those of serine, threonine, or tyrosine, that are released as phosphoamino acids on hydrolysis. Phosphohistidine can be formed as part of an enzyme mechanism (e.g., **phosphoglycerate mutase**), and phosphohomoserine is an intermediate in threonine biosynthesis. The guanidine group can also be phosphorylated to form a phosphono derivative (see **phosphagen**).

phosphoarginine the recommended trivial name for *N*^ω-phosphoarginine; the commonest **phosphagen** in invertebrates. The older name, arginine phosphate, is not recommended.

phosphocreatine *abbr.*: PC; the recommended trivial name for *N*^ω-phosphocreatine; the commonest **phosphagen** in vertebrates. The older name, creatine phosphate, is not recommended.

phosphodiester any diester of phosphoric acid; i.e. any phosphoric ester containing the bridging group –PO(OH)– between two oxygen atoms in other groups (which may be the same or different) or at different positions in the same group. Examples include cyclic nucleotides, glycerophospholipids, and nucleic acids.

phosphodiesterase any esterase that catalyses the hydrolysis of either (but not both) of the ester linkages in a phosphodiester, each linkage being hydrolysed only by an enzyme specific for that linkage. Such enzymes are classified in various sub-subclasses within the subclass EC 3.1, hydrolases, especially in the sub-subclass EC 3.1.4, phosphoric diester hydrolases. The term is often applied to **nucleases** without sugar specificity. See also **cyclic AMP phosphodiesterase**, **phosphodiesterase I**, **phospholipase C**. —**phosphodiesteratic adj.**

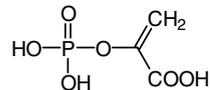

phosphodiesterase I the recommended name for an enzyme, EC 3.1.4.1, that catalyses the hydrolytic removal of 5'-nucleotides successively from the (nonphosphorylated) 3' end of an oligonucleotide; *other name*: 5'-exonuclease.

phosphodiesterase II an enzyme, now named **spleen exonuclease** (EC 3.1.16.1; previously EC 3.1.4.18), that catalyses the hydrolytic removal of 3'-nucleotides successively from the (nonphosphorylated) 5' end of a (preferably single-stranded) ribonucleic or deoxyribonucleic acid; *other names*: 3'-exonuclease; spleen phosphodiesterase.

phosphodiester method a method for the chemical synthesis of oligonucleotides in which, essentially, a 5'-phosphate of an appropriate [mono]nucleotide, after suitable protection of other functional groups, is condensed with the 3'-hydroxyl of a protected nucleoside, [mono]nucleotide, or previously formed oligonucleotide, using dicyclohexylcarbodiimide or an arylsulfonfyl chloride as a coupling agent. The reaction sequence is then repeated with another

nucleotide 5'-phosphate. This method is being superseded by the **phosphate-triester method** and **phosphotriester method**.

phosphoenolpyruvate *abbr.*: PEP or *P*-enolpyruvate; 2-hydroxy-2-propenoate phosphate (ester); 2-(phosphonoxy)-2-propenoate; the phosphate ester formed from the hydroxy group of the enol tautomer of pyruvate. Its hydrolysis to pyruvate gives a particularly large negative change in standard free energy ($-\Delta G^\circ = 62 \text{ kJ mol}^{-1}$ at pH 7). It is a key intermediate in glycolysis and gluconeogenesis, and in the biosynthesis of aromatic amino acids.

phosphoenolpyruvate carboxykinase *abbr.*: PEPCK; any enzyme that catalyses the reaction:

where X–P, depending on source, can be GTP or ITP (in EC 4.1.1.32), ATP (in EC 4.1.1.49), or pyrophosphate (in EC 4.1.1.38). (1) **Phosphoenolpyruvate carboxykinase (GTP)**, EC 4.1.1.32; *systematic name*: GTP:oxaloacetate carboxy-lyase (transphosphorylating); *other names*: phosphoenolpyruvate carboxylase; phosphopyruvate carboxylase; the rate-limiting gluconeogenic enzyme in eukaryotes. It has different forms in cytosol and mitochondria. It catalyses a reaction between GTP and oxaloacetate to form GDP, phosphoenolpyruvate, and CO₂. (2) **Phosphoenolpyruvate carboxykinase (ATP)**, EC 4.1.1.49; *systematic name*: ATP:oxaloacetate carboxy-lyase (transphosphorylating); *other names*: phosphoenolpyruvate carboxylase; phosphopyruvate carboxylase (ATP); it catalyses a similar reaction to (1) but with ATP/ADP not GTP/GDP. In many bacteria it is a Ca²⁺-regulated rate-limiting gluconeogenic enzyme. See also **gluconeogenesis**.

phosphoenolpyruvate carboxylase EC 4.1.1.31; *systematic name*: orthophosphate:oxaloacetate carboxy-lyase (phosphorylating); an enzyme that catalyses a reaction between orthophosphate and oxaloacetate to form phosphoenolpyruvate, H₂O, and CO₂. It is an allosteric homotetramer associated with the **tricarboxylic-acid cycle** in plants; effectors include fatty acids, acetyl-CoA, and fructose 1,6-bisphosphate. It forms oxaloacetate for metabolism by this cycle in plants. *system system*

phosphoenolpyruvate-dependent sugar phosphotransferase system *abbr.*: PTS; a system for bacterial sugar transport; it comprises two main components: **protein-*N*^γ phosphohistidine-sugar phosphotransferase** and **phosphoenolpyruvate-protein phosphotransferase**. It also functions also as a chemoreceptor monitoring the environment for changes in sugar concentration.

phosphoenolpyruvate mutase EC 5.4.2.9; *systematic name*: phosphoenolpyruvate 2,3-phosphonomutase; *other name*: phosphoenolpyruvate phosphomutase. An enzyme that catalyses the conversion of phosphoenolpyruvate to 3-phosphonopyruvate.

phosphoenolpyruvate-protein phosphotransferase EC 2.7.3.9; *systematic name*: phosphoenolpyruvate:protein-L-histidine *N*^γ-phosphotransferase; *other name* enzyme I of the **phosphoenolpyruvate-dependent sugar phosphotransferase system**; a soluble bacterial enzyme, part of a system for the transport of hexoses across the cell membrane, that catalyses the phosphorylation by phosphoenolpyruvate of a low-*M_r*, heat-stable protein, **HPr**.

phosphoester any [mono]ester of phosphoric acid; i.e. any phosphoric ester containing the group –PO(OH)₂ linked to an oxygen atom in a single other group.

phosphofructokinase I *abbr.*: PFK; EC 2.7.1.11; *recommended name*: 6-phosphofructokinase; *other names*: phosphofructokinase 1; phosphohexokinase. An enzyme that catalyses the phosphorylation of D-fructose 6-phosphate to D-fructose 1,6-bisphosphate at the expense of ATP, CTP, ITP, or UTP.

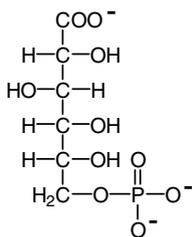

Phosphofructokinase 1 is an allosteric homotetrameric enzyme of glycolysis. There are three genes for human subunits: M (muscle – 799 amino acids), L (liver – 799 amino acids), and P (platelet). Erythrocytes contain five isoenzymes. Mutations in the M or L gene

cause the rare glycogen disease type VII (Tarui disease). *E. coli* has two entirely unrelated isoenzymes, I and II, presumably of independent evolution. **2** or **phosphofructokinase 2** EC 2.7.1.105; *recommended name*: 6-phosphofructo-2-kinase; an enzyme that catalyses the phosphorylation of D-fructose 6-phosphate to D-fructose 2,6-bisphosphate at the expense of ATP. Phosphofructokinase 2 is part of the same bifunctional protein as **fructose-2,6-bisphosphatase**; **phosphorylation** inhibits the kinase activity. **3** or **fructose-1-phosphate kinase** EC 2.7.1.56; *recommended name*: 1-phosphofructokinase; an enzyme that catalyses the phosphorylation of D-fructose 1-phosphate to D-fructose 1,6-bisphosphate at the expense of ATP, GTP, ITP, or UTP.

phosphoglucoisomerase *an alternative name for glucose-6-phosphate isomerase.*

phosphoglucomutase *abbr. (in clinical chemistry):* PGT; EC 5.4.2.2; *systematic name*: α -D-glucose 1,6-phosphomutase; *other name*: glucose phosphomutase. A **phosphotransferase** enzyme that catalyses the interconversion of α -D-glucose 1-phosphate and α -D-glucose 6-phosphate; α -D-glucose 1,6-bisphosphate is an intermediate, formed by phosphoryl transfer from the enzyme. It links the metabolism of polysaccharides to glycolysis. There are three isoenzymes in humans.

phosphogluconate 6-phospho-D-gluconate; an intermediate in the **Entner–Doudoroff pathway** and in the **pentose phosphate pathway**. It is a product of the combined action of **glucose-6-phosphate dehydrogenase** and **6-phosphogluconolactonase**, and is a substrate for **phosphogluconate dehydrogenase (decarboxylating)**.

phosphogluconate dehydrogenase (decarboxylating) *abbr.:* 6PGD; EC 1.1.1.44; *systematic name*: 6-phospho-D-gluconate:NADP⁺ 2-oxidoreductase (decarboxylating); *other names*: phosphogluconic acid dehydrogenase; 6-phosphogluconic dehydrogenase; 6-phosphogluconic carboxylase. An enzyme that catalyses a reaction between 6-phospho-D-gluconate and NADP⁺ to form D-ribulose 5-phosphate, CO₂, and NADPH. It participates in the **pentose phosphate pathway**, and is significant in maintaining NADP⁺ in the reduced state.

phosphogluconate (oxidative) pathway *an alternative name for pentose phosphate pathway.*

6-phosphogluconolactonase EC 3.1.1.31; *systematic name*: 6-phospho-D-glucono-1,5-lactone lactonohydrolase; an enzyme of the **pentose phosphate pathway** that catalyses the hydrolysis of 6-phosphogluconolactone to 6-phosphogluconic acid.

phosphoglycerate 1 2-phospho-D-glycerate; D-glycerate 2-phosphate; (*R*)-2,3-dihydroxypropanoate 2-(dihydrogen phosphate). **2** 3-phospho-D-glycerate; D-glycerate 3-phosphate; (*R*)-2,3-dihydroxypropanoate 3-(dihydrogen phosphate). Both are important intermediates in glycolysis. 3-Phosphoglycerate is a precursor in serine biosynthesis. *Compare glycerophosphate, phosphoglyceride.* *See also phosphoglycerate mutase.*

phosphoglycerate dehydrogenase EC 1.1.1.95; *systematic name*: 3-phosphoglycerate:NAD⁺ 2-oxidoreductase; an enzyme that converts 3-phospho-D-glycerate to 3-phosphohydroxypyruvate in the presence of NAD⁺. It participates in the synthesis of serine from 3-phosphoglycerate.

phosphoglycerate kinase *abbr.:* PGK; EC 2.7.2.3; *systematic name*: ATP:3-phospho-D-glycerate 1-phosphotransferase; an enzyme that catalyses reaction:

The forward reaction is the first one to generate ATP during glycolysis; the reverse reaction participates in CO₂ assimilation during photosynthesis in chloroplasts. It exists in tissue-specific or (in protozoa, etc.) organelle-specific isoforms. Enzyme deficiency in humans results in chronic hemolytic anemia, neurological dysfunction, and myopathy.

phosphoglycerate mutase *abbr.:* PGAM; EC 5.4.2.1; *systematic name*: D-phosphoglycerate 2,3-phosphomutase; *other names*: phosphoglycerate phosphomutase; phosphoglyceromutase. An enzyme of the glycolytic and gluconeogenic pathways that catalyses the reaction:

(the forward direction, as written, being the direction in which the enzyme functions in gluconeogenesis). A phosphotransferase enzyme for which 2,3-bisphospho-D-glycerate acts as a reaction primer. The active enzyme has a phosphoryl group active site (histidine is phosphorylated as part of the mechanism) and transfers phosphoryl to the substrate. *See also phosphohistidine.*

phosphoglycerate phosphomutase *another name for phosphoglycerate mutase.*

3-phospho-D-glyceric phosphoric monoanhydride *see 3-phospho-D-glyceroyl phosphate.*

phosphoglyceride *another (less correct) name for glycerophospholipid.*

3-phospho-D-glyceroyl phosphate *abbr.:* D-glyceric-1,3-*P*₂; *one of the recommended names for (R)-[2,3-dihydroxypropanoyl dihydrogen phosphate 3-(dihydrogen phosphate)], a key intermediate in the glycolytic pathway, commonly but incorrectly known as 1,3-diphosphoglycerate or 1,3-bisphosphoglycerate. Alternative recommended names:* 3-phospho-D-glyceric phosphoric monoanhydride; (D-glyceroyl phosphate) 3-phosphate. This compound should be distinguished from **2,3-bisphospho-D-glycerate**.

phosphohexose isomerase *an alternative name for glucose-6-phosphate isomerase.*

phosphohistidine N^ε-phosphohistidine; it is formed as a residue in certain proteins, being an intermediate in the **phosphoglycerate mutase** reaction and the **phosphoenolpyruvate-dependent sugar phosphotransferase system**.

phosphoinositide *another old term, no longer recommended, for phosphatidylinositol* but now much used to denote all phosphatidylinositol derivatives as a class.

phosphoinositide cycle *another term for phosphatidylinositol cycle.*
phosphoketolase EC 4.1.2.9; a thiamine diphosphate-protein of the phosphoketolase pathway that catalyses phosphorolysis of D-xylulose 5-phosphate and orthophosphate to acetyl phosphate and D-glyceraldehyde 3-phosphate.

phosphoketolase pathway any metabolic pathway, usually in a microorganism, that involves the enzyme **phosphoketolase**, e.g. in **heterolactic fermentation** or in the fermentation of glucose by *Bifidobacterium* spp.

phosphokinase *a former term for kinase.*

phospholamban a homopentameric sarcoplasmic reticulum membrane protein that regulates the calcium pump of cardiac, slow-twitch skeletal, and smooth muscle. It is phosphorylated by protein kinase A in response to β -adrenergic stimulation. The phosphorylated protein increases the rate of the sarcoplasmic reticulum Ca²⁺-ATPase.

phospholemman a 72-residue cell-membrane protein that forms a chloride-selective ion channel. It is a substrate for both protein kinase C and cyclic AMP-dependent protein kinase. It is rapidly phosphorylated after β -adrenergic and α -adrenergic stimulation of the heart, and in response to insulin in muscle. It has a single transmembrane domain.

phospholipase any enzyme that is a lipase and that catalyses the hydrolysis of a glycerophospholipid. Phospholipases have been subdivided as follows.

Phospholipase A1 EC 3.1.1.32; *the recommended name for any carboxylic ester hydrolase that removes the acyl residue at C-1 of the glycerol moiety.*

Phospholipase A2 *the recommended name for any carboxylic ester*

hydrolase that removes the acyl residue at C-2 of the glycerol moiety; e.g. EC 3.1.1.4; *systematic name*: phosphatidylcholine 2-acylhydrolase; *other names*: lecithinase A; phosphatidase; phosphatidolipase. The enzyme requires calcium. Snake-venom enzymes have been much studied and have broad specificity for phosphoglyceride classes. In mammals there are two such enzymes: (1) a pancreatic enzyme, which is released from the exocrine pancreas on stimulation by cholecystokinin, has broad specificity for phosphoglycerides, and hydrolyses phospholipids of digested food in the intestine in conjunction with the action of bile salts to form micelles; and (2) a membrane-bound enzyme, which releases arachidonate for prostanoïd synthesis, and is in many cases stimulated by activated hormone and growth-factor receptors.

Phospholipase B EC 3.1.1.5; *recommended name*: lysophospholipase; *other names*: lecithinase B; lysolecithinase. These are enzymes that remove the acyl group from a lysoglycerophospholipid.

Phospholipase C *abbr.*: PLC; *the recommended name* for any phosphoric diester hydrolase that splits the bond between the phosphorus atom and the oxygen atom at C-1 of the glycerol moiety; *other names*: lipophosphodiesterase I; lecithinase C; *Clostridium welchii* α -toxin. Two major types have been studied, both occur in bacteria and animals: (1) one type acts on phosphatidylcholine, releasing diacylglycerol (EC 3.1.4.3); (2) the other is **1-phosphatidylinositol phosphodiesterase** (EC 3.1.4.10), which acts on phosphoinositides; it catalyses the conversion of 1-phosphatidyl-D-*myo*-inositol to D-*myo*-inositol 1,2-cyclic phosphate (which is hydrolysed in animals but not bacteria to inositol 1-phosphate) and diacylglycerol. **1-Phosphatidylinositol-4,5-bisphosphate phosphodiesterase** (EC 3.1.4.11; *other names*: triphosphoinositide phosphodiesterase; phosphoinositide-specific phospholipase C) catalyses the hydrolysis of 1-phosphatidyl-D-*myo*-inositol 4,5-bisphosphate to D-*myo*-inositol 1,4,5-trisphosphate and diacylglycerol. These enzymes play a role in signal transduction. There are at least six forms of the latter, which is required for production of the second messenger molecules **diacylglycerol** and **inositol 1,4,5-trisphosphate**. The activation involves a G_{α} **G-protein** subunit.

Phospholipase D EC 3.1.4.4; *the recommended name* for any phosphoric diester hydrolase that splits the bond between the phosphorus atom of a glycerophospholipid and the oxygen atom of the nitrogenous base; *other names*: lipophosphodiesterase II; lecithinase D; choline phosphatase.

phospholipid or (formerly) **phospholipide** any lipid containing phosphoric acid as mono- or diester.

phospholipid-cholesterol acyltransferase *see* **phosphatidylcholine-sterol O-acyltransferase**.

phospholipid exchange protein any of a number of cytosolic proteins that bind phospholipids, and transport them within the cell. Each type of protein exhibits a degree of specificity for the phospholipid bound, and each protein molecule carries one or two phospholipid molecules. These proteins function to exchange phospholipid classes between different intracellular membrane sites.

phospholipid-hydroperoxide glutathione peroxidase an enzyme, EC 1.11.1.12, containing selenocysteine, which catalyses the reduction of lipid hydroperoxides, such as those produced by lipoxygenase.

phospholipid transfer protein *abbr.*: PLTP; a plasma protein (human: 476 amino acids) that mediates transfer of phospholipid and cholesterol from triacylglycerol-rich lipoproteins to high-density lipoproteins (HDL). It is expressed in many tissues (including liver) and is homologous with cholesterol ester transfer protein (CETP) and lipopolysaccharide-binding protein.

phospholipid translocase a protein that accelerates the transfer of phospholipid (*see* **flip-flop**) between the inner and outer lipid leaflets of the plasma membrane bilayer.

phosphomannomutase EC 5.4.2.8; *systematic name*: D-mannose 1,6-phosphomutase; an enzyme that catalyses the reaction:

One of its functions is to convert mannose 6-phosphate to mannose 1-phosphate, from which GDPmannose is synthesized; this is a precursor of **fucose**, and is an intermediate in the synthesis of the **mannose** core of oligosaccharides.

phosphomonoester any monoester of phosphoric acid.

phosphomonoesterase 1 *an alternative name for phosphatase 2* *an alternative name for either acid phosphatase or alkaline phosphatase.*

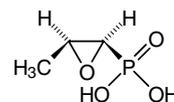

phosphonic acid *see* **phosphono+**.

phosphono+ *comb. form* denoting a phosphonic residue, $-\text{PO}(\text{OH})_2$, derived from **phosphonic acid**, $\text{HPO}(\text{OH})_2$. In biochemical usage this name is usually reserved for the $-\text{PO}(\text{OH})_2$ group attached to a carbon atom, as in **phosphonoacetate**, $(\text{HO})_2\text{OP}-\text{CH}_2\text{COO}^-$; and **2-phosphonoethylamine**, or **ciliatine**, $(\text{HO})_2\text{OP}-\text{CH}_2\text{CH}_2\text{NH}_2$; the group is commonly termed phospho+ when linked to a heteroatom, as in phosphocreatine and phosphogluconate.

N^0 -phosphonoarginine *see* **phosphoarginine**.

N^0 -phosphocreatine *see* **phosphocreatine**.

phosphonomycin or **fosfomycin** (1*R*,2*S*)-(1,2-epoxypropyl)phosphonate; an antibiotic produced by *Streptomyces* and *Pseudomonas* strains. It binds irreversibly to UDP-*N*-acetylglucosamine 1-carboxyvinyl transferase (EC 2.5.1.7), an enzyme catalysing the first stage in the synthesis of bacterial cell-wall peptidoglycan from UDP-*N*-acetylglucosamine, which it thereby inhibits. It penetrates the cell by utilizing the L- α -glycerophosphate transport system. Loss of this system is a primary reason that resistant strains emerge.

phosphopeptide any of a series of oligopeptide derivatives, designed as inhibitors of bacterial cell-wall biosynthesis, that have a C-terminal residue of L-1-aminoethylphosphonic acid (a phosphorus-containing analogue of L-alanine).

phosphopentomutase EC 5.4.2.7; *systematic name*: D-ribose 1,5-phosphomutase; *other name*: phosphodeoxyribomutase. An enzyme that catalyses the reaction:

phosphoprotein any protein containing one or more phosphoric residues directly attached, usually by ester linkage, to amino-acid residues.

phosphoprotein phosphatase 1 EC 3.1.3.16; *systematic name*: phosphoprotein phosphohydrolase; any enzyme that removes a phosphate group from a protein by hydrolysis. Many different enzymes have been identified with varying specificity with respect to the primary structure of the substrate protein. *See* **protein phosphatase 2** *another name for serine/threonine-specific protein phosphatase.*

phosphor any substance (capable of) exhibiting **phosphorescence** (def. 1).

phosphor+ *a variant form of phospho+* (before a vowel).

phosphoramidate or **amidophosphate** or **phosphoric amide 1** any ion, salt, or ester of phosphoramidic acid; amidophosphoric acid; $(\text{OH})_2\text{PO}-\text{NH}_2$. **2** any compound containing the group $(\text{OH})_2\text{PO}-\text{NH}-$ or $(\text{OH})_2\text{PO}-\text{N}<$.

phosphoramidite any compound having the general structure $\text{R}_3\text{R}_4\text{NP}(\text{R}_2)-\text{O}-\text{R}_1$. Phosphoramidites are useful in the synthesis of oligonucleotides or for the addition of groups to the 5'-phosphate of nucleotides or oligonucleotides. R_1 is often cyanoethyl-; R_3 and R_4 are often isopropyl with R_2 in 3'-nucleotide linkage.

phosphoramidon *N*-(α -L-rhamnopyranosyl-oxyphospho)-L-leucyl-L-tryptophan; a specific inhibitor of **thermolysin**. It is an inhibitor of the metalloendopeptidase, EC 3.4.24.11, that is responsible for cleaving and inactivating **natriuretic peptide**, with corresponding pharmacological effects.

phosphoresce to exhibit **phosphorescence** (def. 1).

phosphorescence 1 a type of luminescence consisting of the emission by a substance of electromagnetic radiation, especially visible light, as a result of the absorption of energy derived from exciting radiation of shorter wavelength or from incident subatomic particles (especially electrons or alpha particles), and that persists for more than approximately 10 ns after excitation ceases, the persis-

tence being a consequence of the excited electrons decaying via a **metastable** (def. 2) state; the property of emitting such radiation. **2** the radiation so emitted. **3** a common but erroneous term for **bioluminescence** (which occurs in the absence of exciting radiation). *Compare fluorescence.* — **phosphorescent** *adj.*

phosphorescence spectrophotometry measurement of the wavelengths and the intensities of the light emitted from a phosphorescent sample that is excited by monochromatic (or nearly so) exciting radiation.

phosphori+ a variant form of **phosphoro+** (def. 3).

phosphoriboisomerase see **ribose-5-phosphate epimerase**.

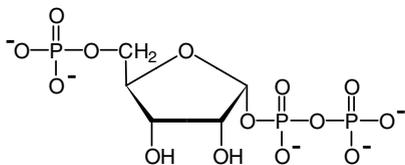

phosphoribosylamine-glycine ligase EC 6.3.4.13; *other names:* phosphoribosylglycinamide synthetase; glycinamide ribonucleotide synthetase (*abbr.*: GARS); an enzyme of *de novo* purine biosynthesis that catalyses the reaction between ATP, 5'-phosphoribosylamine, and glycine to form 5'-phosphoribosylglycinamide (glycinamide ribotide, *abbr.*: GAR) with release of ADP and orthophosphate. The human protein (1010 amino acids) is multifunctional, with domains for three catalytic activities required for purine biosynthesis (amino-acid numbers in brackets): GARS (1–433), **phosphoribosylformylglycinamide cyclo-ligase** (434–809), and **phosphoribosylglycinamideformyl-transferase** (810–1010), although variations with only one or two of the domains occur through alternative splicing.

phosphoribosylaminoimidazolecarboxamide formyltransferase EC 2.1.2.3; *other name:* AICAR transformylase; inosinicase; IMP synthetase; an enzyme of *de novo* purine biosynthesis that catalyses the formation of 5'-phosphoribosyl-5-formamido-4-imidazolecarboxamide from 10-formyltetrahydrofolate and 5'-phosphoribosyl-5-amino-4-imidazolecarboxamide (5-aminoimidazole-4-carboxamide ribotide; *abbr.*: AICAR) forming also tetrahydrofolate. In chicken the protein (593 amino acids) is multifunctional, having activities for AICAR transformylase and **IMP cyclohydrolase**; the latter resides in the C-terminal region.

phosphoribosylaminoimidazole carboxylase EC 4.1.1.21; *other name:* AIR carboxylase; an enzyme of the pathway for *de novo* purine biosynthesis that catalyses the formation of 1-(5'-phosphoribosyl)-5-amino-4-imidazolecarboxylate from 1-(5'-phosphoribosyl)-5-aminoimidazole (5'-aminoimidazole ribotide, *abbr.*: AIR) and CO₂. The reaction requires neither biotin nor ATP. For an example, see **multifunctional protein ade2**.

phosphoribosylaminoimidazolesuccinocarboxamide synthase EC 6.3.2.6; *other name:* SAICAR synthetase; an enzyme that catalyses the formation of 1-(5'-phosphoribosyl)-4-(N-succinocarboxamide)-5-aminoimidazole(N-succinyl)-5-aminoimidazole-4-carboxamide ribonucleotide; *abbr.*: SAICAR) from ATP, 1-(5'-phosphoribosyl)-4-carboxy-5-aminoimidazole and L-aspartate with release of ADP and orthophosphate. The reaction forms part of the pathway for the *de novo* synthesis of purines. For an example, see **multifunctional protein ade2**.

(5)-phospho(-α-D)-ribose diphosphate *symbol:* PPRibP or PRibPP; 5-phospho-α-D-ribofuranosyl diphosphate; α-D-ribose 1-diphosphate 5-phosphate; a compound that is essential in the biosynthesis of various nitrogen-containing ring compounds or their derivatives, especially of histidine, and of purines and pyrimidines as their nucleotides. It is commonly but incorrectly known as phosphoribosyl pyrophosphate (*abbr.* (not recommended): PRPP).

phosphoribosylformylglycinamide cyclo-ligase EC 6.3.3.1; *other name:* phosphoribosyliminoimidazole synthetase; an enzyme of *de novo* synthesis of purines that catalyses the reaction between ATP and 2-formamido-N¹-(5-phosphoribosyl)acetamide to form

1-(5-phosphoribosyl)-5-aminoimidazole with release of ADP and orthophosphate.

phosphoribosylformylglycinamide synthase EC 6.3.5.3; *other names:* phosphoribosylformylglycinamide synthetase; FGAM synthase; an enzyme of the pathway for *de novo* purine biosynthesis that catalyses the formation of 5'-phosphoribosylformylglycinamide from ATP, 5'-phosphoribosylformylglycinamide, L-glutamine, and H₂O with release of ADP, orthophosphate, and L-glutamate.

phosphoribosylglycinamide formyltransferase EC 2.1.2.2; *other names:* 5'-phosphoribosylglycinamide transformylase; GAR transformylase (*abbr.*: GART); an enzyme of *de novo* purine biosynthesis that catalyses the formation of 5'-phosphoribosyl-N-formylglycinamide (formylglycinamide ribotide; *abbr.*: FGAR) from 10-formyltetrahydrofolate, 5'-phosphoribosylglycinamide (glycinamide ribotide, *abbr.*: GAR), and tetrahydrofolate. In chicken there is a multifunctional protein with activities for **phosphoribosylamine-glycine ligase** (GARS)/**phosphoribosylformylglycinamide cyclo-ligase** (AIRS)/GART.

phosphoribosyl pyrophosphate *abbr.*: PRPP; a common name for **(5)-phospho(-α-D)-ribose diphosphate**.

phosphoribosyl pyrophosphate synthetase (*abbr.* PRS) see **ribose-phosphate pyrophosphokinase**.

phosphoribosyltransferase EC 2.4.2.7–2.4.2.12, 2.4.2.17; any enzyme that catalyses the biosynthesis of a mononucleotide from 5-phospho-α-D-ribose diphosphate (PRPP) in a **purine salvage pathway** for nucleoside biosynthesis. Phosphoribosyltransferases catalyse a reaction between a base and 5-phospho-α-D-ribose diphosphate to form a D-ribonucleotide and pyrophosphate; the base may be (number indicates no. in sub-subclass EC 2.4.2) adenine (7), hypoxanthine (8), uracil (9), orotate (10), nicotinate (11), nicotinamide (12), or ATP (17). Examples include: hypoxanthine/guanine phosphoribosyltransferase (**HGPRT**) from human; and ATP phosphoribosyltransferase, involved in histidine biosynthesis, from *Escherichia coli*. Other phosphoribosyltransferases of sub-subclass EC 2.4.2 involve the following (no. in sub-subclass EC 2.4.2): anthranilate (18), dioxotetrahydropyrimidine (20), and xanthine (22).

phosphoric *symbol:* P or (in the one-letter convention for nucleotides) p; *the general name for a residue of [ortho]phosphoric acid* – i.e. tetraoxophosphoric(v) acid, PO(OH)₃ – whether singly, doubly, or triply attached to other groups and whether or not any residual hydroxyl groups are deprotonated.

phosphorimaging a technique for recording a radioactive or chemiluminescent image such as is produced in Southern, Northern, or Western blotting. The image is captured electronically and can be viewed on a computer screen. It is ten times more sensitive than using X-ray film for autoradiography.

phosphorimetry the measurement of **phosphorescence**.

phosphoro+ or (*before a vowel*) **phosphor+** *comb. form* **1** phosphorus. **2** [ortho]phosphoric acid. **3** or **phosphori+** phosphorescence.

phosphoroclastic describing a chemical reaction in which a carbon-carbon bond is split apparently by the action of inorganic phosphate with attachment of a phosphoric group to one of the resulting fragments.

phosphorolysis any reversible lytic process or reaction undergone by an acyl compound (I) or glycosyl compound (II) in which nucleophilic displacement by phosphate (anion) occurs, with formation of the corresponding acyl or sugar phosphate and uptake of a hydron by the other moiety of the original compound, as in the generalized equations:

or

phosphorolytic of, or relating to, phosphorolysis; capable of undergoing phosphorolysis.

phosphorothiolate linkage an analogue of a phosphodiester linkage between nucleotides in which one of the nonbridging oxygens is replaced with a sulphur atom. DNA strands containing phosphorothiolate linkages can be more resistant to the action of nucleases.

phosphorous **1** of, containing, or resembling phosphorus. **2** a

residue of phosphorous acid – i.e. trioxophosphoric(iii) acid, $\text{P}(\text{OH})_3$ – whether singly or doubly attached to other groups and whether or not any residual hydroxyl groups are deprotonated.

phosphorus *symbol*: P; a nonmetallic element of group 15 of the (IUPAC) **periodic table**; atomic number 15; relative atomic mass 30.974; it exists naturally as a single stable nuclide, **phosphorus-31**. Phosphorus occurs only in the combined state, almost exclusively as phosphates. Its commonest covalencies are iii and v. Phosphorus compounds are vital components of all living materials. *See also* **phosphorus-32**, **phosphorus-33**.

phosphorus-31 the stable nuclide ${}^{31}_{15}\text{P}$; its relative abundance in natural phosphorus is 100 atom percent.

phosphorus-32 the artificial radioactive nuclide ${}^{32}_{15}\text{P}$. It emits a relatively high-energy electron or β^- particle (1.709 MeV max.) and no gamma radiation. It has a half-life of 14.3 days.

phosphorus-33 the artificial radioactive nuclide ${}^{33}_{15}\text{P}$. It emits a moderate-energy electron or β^- particle (0.249 MeV max.) and no gamma radiation. It has a half-life of 25.4 days.

phosphorus:oxygen ratio *abbr.*: P:O ratio; the number of atoms of inorganic phosphorus (as phosphate) incorporated into organic compounds (usually ATP) per atom of dioxygen consumed during **oxidative phosphorylation**. The value observed depends on the nature of the substrate being oxidized and the state of preservation of mitochondrial function. If the latter is high, a P:O ratio near 3 is observed during the oxidation of NADH, near 2 for succinate, fatty acyl CoA, 3-phosphoglycerate. *See also* **chemiosmotic coupling hypothesis**, **tight coupling**.

phosphoryl 1 the trivalent group $-\text{P}(\text{O})=$ derived from phosphoric acid. **2** a name used frequently for the univalent group $-\text{P}(\text{O})(\text{OH})_2$; this usage is not recommended; a phosphoric ester may be named, e.g., choline *O*-(dihydrogenphosphate) or *O*-phosphonocholine. However, phosphoryl is accepted except in derived terms such as the names of enzymes (e.g. phosphorylase) or processes (e.g. phosphorylation). *See also* **phosphono+**.

phosphorylase 1 the name recommended for any enzyme, classified as EC 2.4.1.1, that catalyses the phosphorolytic removal of the nonreducing terminal glucose residue from a glucan according to the general reaction:

These enzymes vary somewhat in regard to their preferred substrate; the name should be qualified in each instance by prefixing to it the name of the natural substrate (e.g. starch phosphorylase). In humans, glycogen phosphorylase exists as three isoenzymes – of liver, muscle, and brain – all of which contain pyridoxal phosphate. There are two forms: **phosphorylase a**, the more active, phosphorylated form; and **phosphorylase b** (or dephosphophosphorylase), the less active, unphosphorylated form. The conversion of *b* to *a* is effected with ATP by the enzyme **phosphorylase kinase**, and the conversion of *a* to *b* is brought about by the enzyme **phosphorylase phosphatase** (EC 3.1.3.17). Muscle phosphorylase deficiency results in glycogen disease type V (McArdle disease), and liver phosphorylase deficiency results in glycogen disease type VI (Hers disease). **2** a *generic name recommended* for those glycosyltransferase enzymes within subclass EC 2.4 that utilize orthophosphate as acceptor. Some appear to be specific, e.g. maltose phosphorylase (EC 2.4.1.8) or uridine phosphorylase (EC 2.4.2.3), others less so, e.g. 1,3- β -oligoglucan phosphorylase (EC 2.4.1.30). *See also* **α -glucan phosphorylase**.

phosphorylase kinase *see* glycogen phosphorylase kinase.

phosphorylase-limit dextrin the polysaccharide produced by the action of starch phosphorylase on the branched polysaccharide amylopectin.

phosphorylase phosphatase EC 3.1.3.17; an enzyme that catalyses the hydrolysis of phosphorylase *a* to two molecules of the less active phosphorylase *b* and four of orthophosphate. *See also* **protein phosphatase**.

phosphorylate to effect **phosphorylation**.

phosphorylation the act or process of introducing a **phosphoric** group into a molecule, usually with the formation of a phosphoric ester, a phosphoric anhydride, or a phosphoric amide. Biochemical

phosphorylation reactions are important in the trapping of energy, the formation of biosynthetic intermediates during metabolic processes, and in the control of numerous enzymes and other proteins. *See also* **oxidative phosphorylation**, **photophosphorylation**, **substrate-level phosphorylation**.

phosphorylation state ratio *symbol*: R_p ; a measure of the phosphorylating power of the adenylate system within cells. It is given by:

$$R_p = [\text{ATP}]/[\text{ADP}][\text{P}_i].$$

Compare (adenylate) **energy charge**.

phosphorylcholine-glyceride transferase *see* **diacylglycerol cholinephosphotransferase**.

phosphorylcholine transferase *see* **cholinephosphate cytidylyltransferase**.

phosphorylethanolamine transferase *see* **ethanolamine-phosphate cytidylyltransferase**.

phosphoryl the major phosphate-rich protein of **dentine**. It contains about 40 residue % of phosphoserine and 35 residue % of aspartic acid. It is isolated from incisors, and is involved in bone mineralization. Soluble forms, and a form complexed with collagen in dentine, are known.

phosphoserine *O*-phospho-L-serine; a phosphoamino acid found in peptide linkage in proteins. Phosphorylation of serine and threonine residues is catalysed by protein kinases specific for serine or threonine residues, and phosphorylation and dephosphorylation mechanisms have a regulatory role in the protein function. *See also* **protein kinase**, **protein phosphatase**.

3-phosphoshikimate 1-carboxyvinyltransferase EC 2.5.1.19; *systematic name*: phosphoenolpyruvate:3-phosphoshikimate 5-*O*-(1-carboxyvinyl)-transferase; *other name*: 5-enolpyruvyl shikimate-3-phosphate (EPSP) synthase; an enzyme of the **shikimate pathway** that catalyses the formation of *O*⁵-(1-carboxyvinyl)-3-phosphoshikimate (5-enolpyruvyl shikimate 5-phosphate) from phosphoenolpyruvate and 3-phosphoshikimate with release of orthophosphate. *See* **pentafunctional arom polypeptide**.

phosphosphingolipid *see* **sphingolipid**.

phosphothreonine *O*-phospho-L-threonine; a phosphoamino acid found in peptide linkage in proteins. Phosphorylation of serine and threonine residues is catalysed by protein kinases specific for serine or threonine residues, and phosphorylation and dephosphorylation mechanisms have a regulatory role in the protein function. *See also* **protein kinase**, **protein phosphatase**.

phosphotransferase any enzyme of sub-subclasses EC 2.7.1 to 2.7.4, and EC 2.7.9; phosphotransferases catalyse transfer of a phosphate group from a donor to an acceptor, and are classified according to whether the transfer is to an alcohol group (EC 2.7.1), a carboxyl group (EC 2.7.2), a nitrogenous group (EC 2.7.3), a phosphate group (EC 2.7.4) or to paired acceptors (EC 2.7.9 – only two of these are currently classified, transferring phosphate from ATP to both pyruvate and orthophosphate in one case and to pyruvate and water in the other, yielding AMP in both instances). Enzymes of sub-subclass EC 2.7.6 that transfer diphosphate are classified as **diphosphotransferases**.

phosphotransferase system a system for transferring substrates into bacteria (*see* **phosphoenolpyruvate-dependent sugar phosphotransferase system**).

phosphotriester any triester of phosphoric acid.

phosphotriester method (of oligonucleotide synthesis) a method for the chemical synthesis of oligonucleotides in which a suitably protected phosphodiester of general formula $\text{Nuc-3'-O-P}(\text{O})(\text{OR})\text{OH}$, where R is an aryl group and Nuc is a residue of an appropriate nucleoside, is first condensed with the 5'-hydroxyl group of another nucleoside (usually anchored through its 3'-hydroxyl group to an insoluble support) to form a phosphotriester. Sequential addition of further nucleoside units is then carried out in the same way, the 5'-protecting group being removed at each stage before the next cycle of reactions. All remaining protecting groups are removed at the completion of the synthesis.

phosphotyrosine *O*-phospho-L-tyrosine; a phosphoamino acid found in peptide linkage in proteins, especially in proteins involved

in effector mechanisms in growth stimulation, including growth-factor receptors. *See also* **protein kinase**, **protein phosphatase**.

phosphotyrosine antibodies or **antiphosphotyrosine antibodies** antibodies used in cell-signalling research to detect proteins in which tyrosines are phosphorylated by the action of tyrosine kinases.

phosphovitin or **phosvitin** a phosphoprotein (subunit size 25 kDa) that, together with **lipovitellin**, constitutes the major part of the mass of the egg-yolk proteins in oviparous vertebrates. It has the highest phosphorus content of all known phosphoproteins (10% P), and approximately half of its amino-acid residues are serine, all of which are *O*-phosphorylated. Phosphovitin and lipovitellin are derived from a common precursor protein, **vitellogenin**.

phot the cgs unit of illuminance, equal to one lumen per square centimetre; 1 phot = 10^4 lux.

phot+ a variant form of **photo+** (sometimes before a vowel).

photagogikon (*pl.* **photagogika**) the light-emitting compound of any luminescent system regardless of binding of the compound or of its state of ionization. *See also* **photogen**.

photic **1** of, or relating to, light. **2** of, or relating to, the reaction to light of, or the production of light by, living organisms. **3** describing the uppermost zone in a body of water that receives sufficient light to permit photosynthesis. —**photically** *adv.*

photo+ or (*sometimes before a vowel*) **phot+** *comb. form* denoting **1** of, pertaining to, produced by, or responding to light. **2** involving a photographic process.

photoactivate to render active or reactive by means of light. —**photoactivation** *n.*; **photoactivatable** or **photoactivable** *adj.*

photoactive (*of a substance*) capable of giving a physical or chemical response to light or other electromagnetic radiation.

photoactive yellow protein a blue light photoreceptor, containing FAD as chromophore, implicated in a negative phototactic response in photosynthetic bacteria.

photoaddition any chemical addition reaction promoted by light or other electromagnetic radiation.

photoaffinity label or **photolabel** an **affinity label** carrying a separate photoactivatable group that on illumination reacts with the protein being labelled to form a covalent link.

photoautotroph or **photolithotroph** any organism that is both an **autotroph** and a **phototroph**. —**photoautotrophic** *adj.*; **photoautotrophy** *n.*

photobiochemistry the photochemistry of biochemical processes. —**photobiochemical** *adj.*; **photobiochemically** *adv.*; **photobiochemist** *n.*

photobiology the study of the effects of radiation, mainly of visible and ultraviolet light, on living organisms. —**photobiological** *adj.*; **photobiologist** *n.*

photobleaching the loss of colour or fluorescence through the action of incident visible or near-ultraviolet radiation.

photocatalysis **1** the acceleration of a chemical reaction by light. **2** the catalysis of a photochemical reaction. —**photocatalytic** *adj.*; **photocatalytically** *adv.*

photocathode (*in an electronic device*) a cathode from which electrons are emitted when exposed to electromagnetic radiation of suitable frequency.

photocell or **photoelectric cell** any type of transducer capable of converting incident electromagnetic radiation to an electric signal of corresponding magnitude. It may function by generating a potential difference or a current, or by changing its conductance.

photochemical action spectrum the relationship between the efficiency of a **photochemical reaction** and the frequency of the illuminating light.

photochemical reaction any chemical reaction that is initiated or accelerated by the absorption of visible or near-ultraviolet radiation.

photochemistry the branch of chemistry concerned with the effect of electromagnetic, especially visible and ultraviolet, radiation on chemical processes and with the uptake or production of photons during chemical reactions. —**photochemical** *adj.*; **photochemically** *adv.*

photochromism or **phototropy** the property possessed by certain substances of changing colour reversibly when exposed to electro-

magnetic radiation of appropriate frequency. *Compare* **electrochromism**, **thermochromism**. —**photochromic** *adj.*

photoconductive describing an electrical device that is capable of changing its conductance on exposure to light or other electromagnetic radiation. —**photoconductivity** *n.*

photodamage deleterious chemical change caused by the action of light, especially ultraviolet light.

photodensitometer *see* **densitometer** (def. 1).

photodetector a device, e.g. a **photocell**, that responds to incident light.

photodimerization or **photodimerisation** the formation of dimers by a photochemical reaction. It is of particular importance in the formation of **pyrimidine dimers** in DNA. —**photodimerize** or **photodimerise** *vb.*

photodiode any semiconductor **diode** (def. 1) that generates a potential difference or changes its conductivity when exposed to light.

photodissociation the splitting of a molecule into smaller molecules, radicals, or atoms on absorption of a quantum of electromagnetic radiation.

photodynamic involving, causing, or promoting a deleterious reaction to light, particularly ultraviolet light. Such reactions usually involve oxidation. Damage is caused by **singlet oxygen** produced, e.g., by illumination of chlorophyll in chloroplasts. Normally the singlet oxygen is quenched by the carotenoid pigments coexisting with the chlorophylls in chloroplasts. Hence, any mutation that deletes carotenoids from chloroplasts is lethal, because the chlorophylls are destroyed by singlet oxygen.

photoelectric of, pertaining to, or concerned with electric or electronic effects caused by electromagnetic radiation, especially light.

photoelectric cell *an alternative name for* **photocell**.

photoelectron an electron that is ejected from an atom on interaction of the atom with a photon of sufficient energy.

photoelectron micrograph any photograph of an object taken by **photoelectron microscopy**.

photoelectron microscopy an electron-microscopic technique in which **photoelectrons** emitted from a specimen exposed to ultraviolet radiation are accelerated and focused to produce an image. It is the counterpart in the electron microscope of fluorescence microscopy in the light microscope, the resolution being correspondingly enhanced.

photoelectron spectroscopy a technique in which a specimen (a gas sample or the surface of a solid or a liquid) is exposed to monochromatic electromagnetic radiation in the ultraviolet or X-ray regions and the energy spectrum of the emitted **photoelectrons** recorded. This provides information about the atomic composition of the specimen and also about the types of orbitals to which the constituent electrons of its atoms and molecules are assigned.

photoemission the emission of electrons from a surface as a result of bombardment by photons.

photoexcitation the act or process of raising an atom or molecule to a higher energy state by interaction with a photon.

photogen **1** *an older term for* **photagogikon**. **2** *a term proposed for the specific biochemical precursor of a* **photagogikon**.

photographic emulsion or **emulsion** any medium that is sensitive to light or other electromagnetic radiation, used for preparing photographic film, paper, etc., and consisting usually of a suspension of a silver salt (especially the bromide or chloride) in gelatin; a coating of such a suspension applied to a substrate.

photoheterotroph or **photoorganotroph** any organism that is both a **heterotroph** and a **phototroph**. —**photoheterotrophic** *adj.*; **photoheterotrophy** *n.*

photoinactivation the irreversible abolition of specific biological activity by the action of light.

photoinhibition the reversible abolition of specific biological activity by the action of light.

photoionization or **photoionisation** the ionization of a molecular entity by the loss of an electron on interaction of the entity with a photon of sufficient energy.

photokinesis any change in the undirected movement of an organism in response to variation in light intensity. —**photokinetic** *adj.*

photolabel *an alternative term for* **photoaffinity label**.

photolabile (*of a substance*) unstable in the presence of light.

photolithotroph *an alternative term for photoautotroph.* —**photolithotrophic** *adj.*; **photolithotrophy** *n.*

photoluminescence luminescence as a result of absorption of electromagnetic radiation. The emitted light is always of lower frequency than that of the incident radiation. —**photoluminescent** *adj.*; **photoluminesce** *vb.*

photolyase *see photoreactivation.*

photolyse or (*sometimes, US*) **photolyze** to subject to or to undergo photolysis.

photolysis the cleavage of one or more covalent bonds in a molecular entity resulting from absorption of energy from light or other electromagnetic radiation; any photochemical process in which such a cleavage is an essential part, e.g. laser photolysis; flash photolysis. —**photolytic** *adj.*; **photolytically** *adv.*

photolyze *a US spelling of photolyse.*

photometer any instrument used to measure the intensity of light or other electromagnetic radiation; includes **spectrophotometer**.

photometry the measurement of the intensity of light or other electromagnetic radiation; it includes spectrophotometry (*see spectrophotometer*). —**photometric** *adj.*; **photometrically** *adv.*

photomicrograph a photograph taken through a light microscope; it is sometimes, incorrectly, termed a microphotograph. —**photomicrographic** *adj.*; **photomicrographically** *adv.*; **photomicrography** *n.*

photomultiplier a photocell consisting of a **photocathode** linked to an **electron multiplier**. Photons striking the photocathode cause the emission of electrons, which are then amplified by the electron multiplier to give an enhanced signal.

photon *symbol (in nuclear reactions, etc.): γ* ; a quantum of light (or other electromagnetic radiation) considered as a particle with zero rest mass, zero charge, and energy $h\nu$ joule, where h is the Planck constant and ν the frequency of the radiation in hertz.

photon counter a device, consisting of a photomultiplier and an associated scaler, that is capable of responding to and recording individual photons.

photonicking photolysis of a nucleic-acid molecule with production of a **nick**.

photoorganotroph *an alternative term for photoheterotroph.* —**photoorganotrophic** *adj.*; **photoorganotrophy** *n.*

photooxidize or **photooxidise** to oxidize by the use of, or as a result of, radiation in the visible and ultraviolet wavelengths. —**photooxidizable** or **photooxidisable** *adj.*

photoperiod **1** the length of daylight in a 24-hour period. **2** the duration of daily exposure of an organism to illumination; the length of this period that favours optimum functioning. —**photoperiodic** *adj.*; **photoperiodically** *adv.*

photoperiodism or **photoperiodicity** the response of an organism to the relative durations of light and dark in a 24-hour period.

photophore any light-emitting organ of an animal.

photophosphorylation or **photosynthetic photophosphorylation** the metabolic processes by which photosynthetic organisms use light energy to convert ADP to ATP without the concomitant reduction of dioxygen to water that occurs in oxidative phosphorylation (*see photosynthesis*). There are two distinct electron transport mechanisms: in **noncyclic photophosphorylation**, which involves both photosystems I and II, ATP synthesis is linked to the transport of electrons from water to NADP^+ , with production of NADPH and dioxygen; in **cyclic photophosphorylation**, which involves only photosystem I, ATP synthesis is driven by a proton gradient generated across the thylakoid membrane.

photopia adjustment of the eye to vision in light of moderate or high intensity, permitting perception of colour; it is considered to involve mainly the **cone cells** of the retina. *Compare scotopia.* —**photopic** *adj.*

photopigment any pigment whose chemical state depends on the intensity of the light falling on it.

photopolymerize or **photopolymerise** to effect polymerization by the action of light. —**photopolymerization** or **photopolymerisation** *n.* (**6-4**)**photoproduct** a type of **pyrimidine dimer**.

photoprotein any protein actively involved in the emission of light by a living organism.

photopsin an **opsin** that is the apoprotein of an **iodopsin**.

photoreactivating enzyme *see DNA photolyase, photoreactivation.*

photoreactivation the process by which genetic damage caused to

organisms by ultraviolet radiation can be reversed by subsequent illumination with visible or near-ultraviolet light. The pyrimidine dimers formed in DNA by the action of ultraviolet light bind **DNA photolyase**, which absorbs light, maximally at 380 nm, and catalyses the restoration of two pyrimidine residues in the DNA.

photoreactive (of a substance or reagent) reactive in a photochemical reaction. —**photoreactivity** *n.*

photoreceptor any biological structure that responds to incident electromagnetic radiation, particularly visible light. It especially refers to a cell that, on absorbing light, generates a nerve impulse or impulses.

photoreduction **1** chemical reduction brought about by electromagnetic radiation, especially visible light. **2** a process occurring at low light intensities in certain algae whereby dihydrogen functions in place of water as an electron donor for the reduction of carbon dioxide and oxygen is not evolved; at higher light intensities normal photosynthesis takes place. **3** reduction in size photographically.

photorespiration a light-dependent catabolic process occurring concomitantly with photosynthesis in plants (especially **C₃ plants**) whereby dioxygen is consumed and carbon dioxide is evolved. The substrate is glycolate formed in large quantities in chloroplasts from 2-phosphoglycolate generated from ribulose 1,5-bisphosphate by the action of **ribulose-bisphosphate carboxylase**; the glycolate enters the peroxisomes where it is converted by **glycolate oxidase** to glyoxylate which undergoes transamination to glycine. This then passes into the mitochondria where it is decarboxylated. **C₃ plants** may lose 20–40% of photosynthetically fixed carbon by photorespiration, whereas **C₄ plants** lose relatively little. **C₄ plants** defeat photorespiration in two ways. First, they recapture released CO_2 in the cytoplasm using **phosphoenolpyruvate carboxylase** which has a very high affinity for CO_2 . Although this does not directly affect photorespiration, it prevents loss of CO_2 . Second, they concentrate CO_2 near ribulose-bisphosphate carboxylase, and this increases the $\text{CO}_2:\text{O}_2$ ratio, which has the effect of inhibiting the oxygenase activity. —**photorespiratory** *adj.*

photosensitivity **1** the property of being reactive or unusually reactive to incident photons, especially to those of visible light. **2** (*in medicine*) an abnormal, local or generalized reaction to sunlight, due to the accumulation in the skin of **photodynamic** substances, either endogenous or exogenous. —**photosensitive** *adj.*

photosensitize or **photosensitise** **1** to render photosensitive; *see photosensitivity*. **2** to render a target molecule more reactive (e.g. more easily oxidized) by the addition to it of a second type of molecule, often a dye, that absorbs light energy and transfers it to the target molecule. —**photosensitization** or **photosensitisation** *n.*

photosensitizer or **photosensitiser** any substance that photosensitizes or is photodynamic.

photosuicide inhibitor a type of **suicide inhibitor** that, after reaction with an enzyme or other appropriate protein, is capable of being selectively photodecomposed to a highly reactive species that can irreversibly modify the protein in the neighbourhood of its active site.

photosynthate any product of the dark reactions of photosynthesis.

photosynthesis **1** (*in biology*) the synthesis by organisms of organic chemical compounds, esp. carbohydrates, from carbon dioxide using energy obtained from light rather than from the oxidation of chemical compounds (*compare chemosynthesis*). In higher plants, green algae, and cyanobacteria, water is the electron donor and dioxygen is evolved; in other photosynthetic bacteria, however, various other simple substances (e.g. H_2S) may act as electron donors, dioxygen is not formed, and the photosynthetic pathway is simpler. Photosynthesis comprises two separate processes: the light reactions and the dark reactions of photosynthesis. The system in higher plants, green algae, and cyanobacteria brings about an overall reaction in which electrons are released from water molecules and are transferred through complexes of chlorophylls, cytochromes, proteins, and small molecules to NADP^+ , reducing it to NADPH. Protons are released from water and form a chemiosmotic gradient that results in the formation of ATP by a process similar to that operating in mitochondria (*see chemiosmotic coupling hypothesis*). These are the **light reactions**. The NADPH and ATP

formed by these reactions then drive the **dark reactions** i.e. the **reductive pentose phosphate cycle**. The electrons and protons are released from water by the oxygen-evolving complex (*abbr.*: OEC), and dioxygen is formed in the process. The sequence of reactions involves the OEC, from which electrons pass to photosystem II (*see photosystem*), thence to **plastoquinone** reducing it to a quinol which then reduces the cytochrome *b_{6-f}* complex. This in turn reduces **plastocyanin** which passes electrons to photosystem I (*see photosystem*) which then reduces NADP⁺ to NADPH. In photosynthetic bacteria, a simpler system exists, in which water is not split, dioxygen is not evolved, and NADP⁺ is not reduced directly. In this system, photons excite molecules of bacteriochlorophyll *b* in a **photosynthetic reaction centre** to transfer electrons through a cyclic electron-transfer system. Cyclic electron flow can also occur under some conditions in plants, and involves only photosystem I, electrons being released by photon activation from photosystem I and returned to it through cytochrome *b_{6-f}* and plastocyanin, with pumping of protons to generate ATP. Under these conditions there is no reduction of NADP⁺. **2** (*in chemistry*) any synthesis by a photochemical reaction. —**photosynthetic adj.**; **photosynthetically adv.**

photosynthetic phosphorylation *an alternative term for photophosphorylation.*

photosynthetic quotient a ratio of the rate of dioxygen evolution by a cell or organism capable of photosynthesis to that of carbon dioxide uptake. It is an index of photosynthetic activity relative to respiration (including photorespiration).

photosynthetic reaction centre the photosynthetic complex in bacteria, consisting essentially of a transmembrane protein of three subunits, denoted L, M, and H. Collectively the three subunits generate 11 transmembrane helices. Although the L and M helices (which have binding sites for the many prosthetic groups) are different, the groups themselves are arranged with near twofold symmetry because of similarities in the folds of the subunits. The L and M subunits bear bacteriochlorophyll, bacteriopheophytin, ubiquinone, and menaquinone molecules. The bacteriochlorophylls will be either *a* or *b* types, as will be the bacteriopheophytins. Here we describe a system with *b* types. Of the four bacteriochlorophyll *b* molecules, two constitute a 'special pair' with an Mg²⁺–Mg²⁺ distance of 7 Å and in hydrophobic environments; other prosthetic groups are **bacteriopheophytin *b*** (two molecules), one nonheme Fe(ii), one **ubiquinone**, and one **menaquinone**. There is cyclic electron flow through a cytochrome *bc₁* complex, cytochrome *c*, and the bacteriochlorophyll–bacteriopheophytin complex, protons being pumped from the bacterial cytosol to the periplasmic space, and then returning to the cytosol through an ATP synthase with synthesis of ATP. The system differs from that in plants in that there is only one type of reaction centre, no splitting of water, and no direct reduction of NADP⁺. Its essential features are that photons excite electrons in the 'special pair' and these excited electrons then flow through the bacteriochlorophyll–bacteriopheophytin complex, ubiquinone, and menaquinone, dissipating energy in bringing about protein pumping to form the chemiosmotic gradient that results in ATP formation. They then return to the 'special pair' via cytochromes *bc₁* and *c*. This protein (and the complex from *Rhodospseudomonas viridis*) represents the first transmembrane protein to have its 3-D structure determined in atomic detail by X-ray crystallography – by J. Deisenhofer, German biophysicist Hartmut Michel (1948–), and German biochemist Robert Huber (1937–). *See also* P870, P960, **photosystem** (def. 2).

photosystem 1 either of the two functionally distinct but cooperating systems, designated photosystem I (*abbr.*: PSI) and photosystem II (*abbr.*: PSII), between which are distributed the various molecules that effect the light reactions of **photosynthesis**; photosystems are located in the **thylakoid** membranes of the chloroplasts of higher plants and green algae or in the free thylakoid membranes of cyanobacteria. Photosystem I consists of a transmembrane multi-subunit complex, of about 10 subunits in all, consisting of a heterodimer complex of PsaA and PsaB which binds P700, together with the chlorophyll acceptor A₀, the phylloquinone acceptor A₁, and Fx, a 4Fe–4S centre. PsaC, which is bound to this complex, contains two additional 4Fe–4S centres required for ferredoxin reduction. PsaC of pea is similar to bacterial-type 4Fe–4S ferredoxins.

Other subunits are involved in binding soluble ferredoxin, ferredoxin–NADP oxidoreductase and regulation of electron flow. Approximately 100 chlorophyll *a* molecules are bound to the minimal heterodimer unit. Photosystem II is formed from a heterodimer of the D₁ and D₂ proteins which bind P680, together with the pheophytin acceptor, two plastoquinone acceptors Q_a and Q_b, and a non-heme iron atom. The minimal purified unit contains about six chlorophyll *a* molecules. **Cytochrome *b₅₅₉*** is always associated with PSII. A large number of other subunits including light-harvesting chlorophyll-protein complexes, proteins involved in stabilizing the Mn complex, and regulatory subunits are required to form a functional photosystem II. **2** any functionally analogous but simpler single photosystem present in photosynthetic bacteria. That from *Rhodospseudomonas viridis* contains three hydrophobic subunits, a special pair of bacteriochlorophyll *b* (the reaction-centre bacteriochlorophyll P960), two molecules of bacteriopheophytin *b* (*see bacteriopheophytin*), a bound iron atom and one molecule each of **ubiquinone** and a **menaquinone**. There are four heme *c*-type cytochromes in this case (but not in all). The complete structure has been determined by X-ray crystallography. *See also photosynthetic reaction centre.*

phototaxis the movement of a motile cell or organism towards (**positive phototaxis**) or away from (**negative phototaxis**) a source of light. —**phototactic adj.**

phototoxic able to cause physiological damage by making the skin abnormally sensitive to light. —**phototoxicity *n.***

phototransistor a type of junction transistor that responds to incident light or other electromagnetic radiation by the generation of an electric current, which is then amplified.

phototroph or **phototrophe** any organism whose principal or only source of primary energy is sunlight. The great majority of such organisms are **photoautotrophs** (or **photolithotrophs**), which use light energy to synthesize their organic requirements solely from inorganic precursors; these include all green plants and algae, cyanobacteria, and green and purple sulfur bacteria. Relatively few phototrophs are **photoheterotrophs** (or **photoorganotrophs**), which require a supply of organic precursors to manufacture their own organic components; examples include certain purple nonsulfur bacteria. *Compare chemotroph.* —**phototrophic adj.**; **phototrophy *n.***

phototropic 1 involving or showing **phototropism**. **2** involving or showing phototropy (i.e. **photochromism**).

phototropin a blue-light receptor protein, containing FMN as chromophore, that regulates different aspects of growth and development in plants.

phototropism the orientation or growth of a cell or (a part of) an organism in relation to a source of light. The term is used especially of plants or plant organs.

phototropy *an alternative term for photochromism.*

phototube a type of photocell consisting of a vacuum tube or gas-filled tube in which a photocathode responds to incident light or other electromagnetic radiation by emission of electrons.

phox *abbr.* for phagocyte NADPH oxidase.

php *see programming language.*

pH paper absorbent paper, usually in strip form, that is impregnated with a colour-changing pH indicator dye. It is useful for estimating the approximate pH of a solution.

pH profile *see pH-activity profile.*

phragmoplast a structure formed in the developing plant cell wall from the endoplasmic reticulum and spindle fibres. It is observed during **cytokinesis** in plant cells as a cylindrical structure, composed of microtubules, between the two sets of daughter chromosomes. The microtubules are those of the two sets of polar microtubules of the **spindle**. These microtubules transport small Golgi-derived vesicles to the equatorial (or central) region, which fuse there to form the early **cell plate**, which then grows out to join up with the cell wall.

PHRAP *see sequence assembly software.*

PHRED *see sequence assembly software.*

phrenosin a **cerebroside** in which the acyl constituent is cerebronate. *See lignocerate*, of which cerebronate is the 2-hydroxy derivative.

PHRP *abbr.* for parathyroid hormone-related protein.

pH standard any of a set of six standard solutions which may be

used as primary pH standards; they are: potassium hydrogen tartrate, saturated at 25°C, pH 3.557 at 25°C; 0.1 mol/kg potassium dihydrogen citrate, pH 3.776 at 25°C; 0.025 mol/kg KH_2PO_4 + 0.025 mol/kg Na_2HPO_4 , pH 6.865 at 25°C; 0.008695 mol/kg KH_2PO_4 + 0.03043 mol/kg Na_2HPO_4 , pH 7.413 at 25°C; 0.01 mol/kg disodium tetraborate, pH 9.180 at 25°C; 0.025 mol/kg NaHCO_3 + 0.025 mol/kg Na_2CO_3 , pH 10.012 at 24°C.

pH-stat an instrument for maintaining a constant pH in an aqueous liquid mixture in which hydrogen ions are being liberated or taken up. It is frequently arranged to measure the amount of reagent, as a function of time, that has to be added to maintain a predetermined pH.

Pht< or **-Pht-** symbol for the (divalent) phthaloyl group.

Pht- symbol for the (univalent) phthalyl group.

phthalate 1 the trivial name for 1,2-benzene dicarboxylate, the dianion of phthalic acid. **2** any mixture of phthalic acid and its mono- and dianions. **3** any salt or ester of phthalic acid.

phthaloyl symbol: Pht< or -Pht-; the divalent acyl group, $-\text{OC}-\text{C}_6\text{H}_4-\text{CO}-$, derived from phthalic acid.

phthalyl symbol: Pht-; the univalent acyl group, $\text{HOOC}-\text{C}_6\text{H}_4-\text{CO}-$, derived from phthalic acid.

pH unit the difference between any two successive integral values of pH.

phyco+ comb. form denoting seaweed or other algae.

phycobilin any bilin found in **phycobiliproteins**. The two most common are **phycocyanobilin** and **phycoerythrobilin**. They are linear tetrapyrroles or **open tetrapyrroles**, i.e. chains of four pyrroles, the terminal pyrroles not being linked to each other to form the cyclic tetrapyrrole structure. The structure of phycocyanobilin is shown; phycoerythrobilin is similar, except that the ethyl group on ring A is $-\text{CH}=\text{CH}_2$, and the methyne group between rings A and B is a methylene group.

phycobiliprotein or **biliprotein** any phycobilin-protein conjugate found in algae of the phyla Cryptophyta and Rhodophyta, and in cyanobacteria. Phycobiliproteins are intensely coloured, fluorescent, water-soluble globular proteins. The two most common types, **phycocyanin** and **phycoerythrin**, are composed of two kinds of subunit, α (10–20 kDa) and β (14–30 kDa), each of which carries about three molecules of covalently bound **phycobilin** (phycocyanobilin in phycocyanin, phycoerythrobilin in phycoerythrin), and is present *in vivo* most commonly as aggregates of formula $(\alpha, \beta)_n$, where n is 3 or 6. Phycocyanin (blue: A_{max} at 618 nm) predominates in Cyanophyta, and phycoerythrin (red: A_{max} at 545 nm) predominates in Rhodophyta. A third type, **allophycocyanin** (pale blue: A_{max} at 650 nm), present in small amounts in both Cyanophyta and Rhodophyta, has only one type of protein subunit (~15.5 kDa), carries one molecule of covalently bound phycocyanobilin, and is present *in vivo* as aggregates of six subunits. It is a heterodimer of α and β chains. See also **phycobilisome**.

phycobilisome any of the granules, approximately 32 nm \times 48 nm, consisting of highly aggregated **phycobiliproteins**, that are attached in arrays to the external face of a **thylakoid** membrane in algae of the phyla Cyanophyta and Rhodophyta, where they function as light-harvesting devices in photosynthesis. Excitation energy in the phycobilisome flows in the sequence:

phycoerythrin \rightarrow phycocyanin \rightarrow allophycocyanin,

whence it passes to the antenna chlorophyll of photosystem II. In Cyanophyta it is also known as a **cyanosome**.

phycocyanin a blue phycobilin; see **phycobiliprotein**.

phycocyanobilin a type of **phycobilin**; see also **phycobiliprotein**.

phycoerythrin a red phycobilin; see **phycobiliprotein**.

phycoerythrobilin a type of **phycobilin**; see also **phycobiliprotein**.

phycofluor any artificial conjugate of a **phycobiliprotein** with a molecule conferring biological specificity (e.g., avidin, immunoglobulin, protein A). Such conjugates are useful in fluorescence immunoassay and fluorescence-activated cell sorting, by virtue of the distinctive and intense fluorescence of the phycobiliprotein moiety.

phyco toxin any poisonous substance produced by algae.

phylo+ a variant form of **phylo+** (sometimes before a vowel).

phyla the plural of **phylum**.

PHYLIP abbr. for phylogeny inference package; see **phylogeny package**.

phylo+ or (before a vowel) **phyll+** comb. form denoting leaf.

phyllocerulein or (esp. Brit.) **phyllocaerulein** see **cerulein**.

phyloquinone abbr.: K; the recommended name for vitamin K₁; 2-methyl-3-phytyl-1,4-naphthoquinone. See **vitamin K**.

phylo+ or (sometimes before a vowel) **phyll+** comb. form denoting race or tribe.

phylogenetic analysis study of the evolutionary relationships between genes, populations, species, etc., usually by constructing **phylogenetic trees**. Phylogenetic analysis may also be applied to individual characters, in order to chart the evolution of particular traits or conditions.

phylogenetic tree a graphical representation of the (putative) evolutionary relationships of a group of organisms.

phylogenomic analysis the application of phylogenetic analysis methods at the level of whole genomes. It is used, for example, to chart the evolutionary history of individual genes (and their products), of genome segments, or of complete genomes.

phylogeny the evolutionary history of an organism or group of related organisms. In biochemistry, such evolutionary relationships are based on similarities and differences in nucleic acid or protein sequences. —**phylogenetic** or **phylogenic** adj.

phylogeny package a software suite for phylogenetic analysis, which typically includes parsimony, maximum-likelihood, and distance methods, together with various tree-drawing tools. Examples include PAUP (phylogenetic analysis using parsimony) and PHYLIP (phylogeny inference package).

phylogram a phylogenetic tree that indicates the relationships between taxa and also conveys a sense of time or rate of evolution.

phylum (pl. **phyla**) a primary taxon of animals or plants (in plants also termed division). It consists of a number of classes (or sometimes a single class).

physalaemin Glp-Ala-Asp-Pro-Asn-Lys-Phe-Tyr-Gly-Leu-Met-NH₂; an 11-residue peptide amide **tachykinin** from the skin of the amphibian *Physalaemus fuscumaculatus*. It is more potent than **eleo-** and **substance P** in some assay systems, and is useful in the study of receptors for substance P.

physeteric acid see **tetradecenoic acid**.

physical 1 of, or pertaining to, matter and energy; of material things. **2** of, or relating to, natural science, especially of nonlinear systems. Compare **biological**. **3** having reference to or used in physics. —**physically** adv.

physical adsorption an alternative term for **physisorption**.

physical biochemistry the application of physical chemistry to biochemical substances, structures, and systems. Often used synonymously with **biophysical chemistry**.

physical chemistry the branch of chemistry concerned with the relationship between the physical properties of substances and their chemical properties, reactions, and structures.

physical map a map that identifies the physical location of genes on a chromosome, in contrast to a **linkage map**, which is generated by measuring recombination frequencies. Physical length can be measured in base pairs, kilobases, or megabases. Such maps are obtained using a variety of methods, e.g. pulsed field gel electrophoresis, fluorescence *in situ* hybridization, contig mapping using polymorphic markers, and by sequencing entire genomes.

physico+ comb. form denoting physical or of physics.

physicochemical of, pertaining to, or using the methods of physical chemistry. —**physicochemically** adv.

physics functioning as sing. the branch of science concerned with the properties of matter and of energy, and with the interactions and interconversions between matter and energy.

physin any of various membrane proteins that have similar architecture to, and are homologous with, the **gyrin** family. They occur in several types of transport vesicle. Examples include pantophysin, synaptophysin, and synaptobrevin.

physiological 1 of, pertaining to, or used in physiology. **2 normal** (def. 4); not **pathological** (def. 2) or **pharmacological** (def. 2). —**physiologically** adv.

physiological antagonist a drug that produces the opposite effect

to a specified agonist by an action that is unrelated to that of the agonist.

physiological chemistry an older term for **biochemistry** (especially that of humans and higher animals).

physiological conditions environmental conditions simulating those under which the (normal) functions of a cell, organ, or tissue can be expressed.

physiological saline or (*sometimes*) **normal saline** a (sterile) solution of 0.9% w/v (0.154 mol L⁻¹) sodium chloride in water. It is approximately isotonic with mammalian blood and lymph, and is useful in the temporary maintenance of living cells and tissues, and as a vehicle for injections.

physiology the science dealing with the functioning of cells, tissues, organs, and organisms, and with the chemical and physical phenomena concerned.

physisorption or **physical adsorption** or **van der Waals adsorption** the type of **adsorption** (def. 1) in which only van der Waals forces are involved and hence in which no significant changes occur in the electronic orbital patterns of the interacting substances. *Compare chemisorption.*

physostigmine or **eserine** a toxic alkaloid extracted from Calabar beans (*Physostigma venenosum*). It inhibits **cholinesterase** by binding to the anionic site of the enzyme, forming a carbamoyl ester of the serine hydroxyl, which is only slowly hydrolysed. It has been used in West Africa in witch ordeals.

phyt+ a variant form of **phyto+** (before a vowel).

phytanic acid 3,7,11,15-tetramethylhexadecanoic acid; a branched-chain fatty acid that is formed metabolically from **phytol**, a constituent of chlorophyll, by bacteria in the ruminant stomach. In humans it is derived from dairy products, meat, ruminant fat, fish, and free phytol. Its oxidation in animals depends on the **alpha oxidation** pathway, since the methyl group on C-3 (the beta carbon) blocks beta oxidation. After alpha oxidation this methyl group is on C-2 of the product, so that beta oxidation can occur, releasing propionyl-CoA as a product. It accumulates secondarily in various peroxisome biogenesis disorders (e.g. **Zellweger syndrome**) and primarily in **Refsum disease** (classical or adult).

phytanoyl-CoA hydroxylase EC 1.14.11.18; an enzyme of liver peroxisomes that catalyses the reaction:

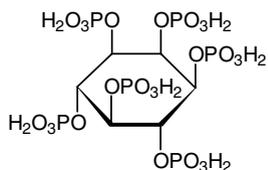

The reaction requires Fe²⁺ and ascorbate, and is the first step in the catabolism of **phytanic acid**. Enzyme deficiency results in classical or adult **Refsum's disease**.

phytase either of the two enzymes, designated 3-phytase (EC 3.1.3.8) and 6-phytase (EC 3.1.3.26), that catalyse the hydrolytic removal of a phosphoric residue from **phytate** at the 3-position or the 6-position, respectively; most commonly it signifies 6-phytase.

phytate any anion of **phytic acid**, any mixture of free phytic acid and its ionized forms, or any salt of phytic acid. It is the major phosphorus compound in plants and is important for phosphate storage in cereal grains, especially as its calcium–magnesium salt, **phytin**. In higher animals phytin binds dietary Ca²⁺ and Mg²⁺, making them less available.

+phyte noun suffix denoting 1 plant (of the habitat or type specified). 2 pathological outgrowth. —**+phytic adj.**

phytic acid the trivial name for *myo*-inositol hexakis(dihydrogen phosphate). *See phytate.*

phytin *see phytate.*

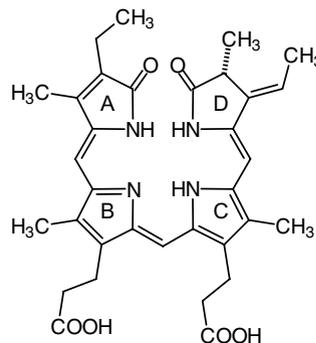

phyto+ or (*before a vowel*) **phyt+** *comb. form* denoting plant.

phytoagglutinin or (*rarely*) **phytohemagglutinin** any plant **lectin**. The majority are glycoproteins, although some, e.g. **concanavalin A**,

contain no carbohydrate. They accumulate mainly in seeds, in cytoplasm of cotyledons and embryonic cells, although they are synthesized in leaves.

phytoalexin any substance with antibiotic activity that is produced by plant tissues in response to infection, especially with a fungus. A variety of substance are regarded as phytoalexins. They include compounds as divergent as **phaseollin**, some sesquiterpenes and long-chain acetylenic alcohols.

phytochelatin any of a group of peptides that bind heavy metals (Cd, Zn, Cu, Pb, Hg) in thiolate coordination complexes, and can be isolated from plant cell suspension cultures. The structure is of the type (γ -glutamyl-cysteinyl)_n-glycine, where *n* is 2 to 11.

phytochelatin synthase EC 2.3.2.15; *recommended name:* γ -Glu-Cys-dipeptidyltransferase; an enzyme that catalyses the reaction:

where *n* = 2–11. It is induced by, and active only in the presence of, heavy metals (e.g. Cd, Cu, Hg, As), and is present in plants, some microorganisms, and the nematode *Caenorhabditis elegans*. Examples: *Arabidopsis thaliana* (485 amino acids); *Schizosaccharomyces pombe* (414 amino acids); *C. elegans* (371 amino acids); and *Dicotylestium discoideum* (626 amino acids). All are rich in cysteine and show 40–50% sequence identity in their N-terminal regions.

phytochemistry the branch of chemistry concerned with plants, especially with **secondary metabolites**.

phytochrome a chromoprotein present in trace amounts in all higher plants, involved in regulating light-dependent processes, such as leaf development and flowering. It consists of a **phycobilin**-related chromophore covalently linked to a polypeptide of ~124 kDa. Phytochrome exists in two forms, P_R (*A*_{max} at 666 nm) and P_{FR} (*A*_{max} at 730 nm), which are indefinitely interconvertible on absorption of light in the red and far-red regions of the spectrum, respectively. The spectral changes are the result of *cis-trans* isomerization in the phycobilin. The active form, P_{FR}, plays a central role in light-promoted modulation of gene expression, which is of importance in plant growth and development in every phase of the life cycle; conversion of P_{FR} to P_R cancels these responses. The phytochromes are homodimeric proteins, with a linear tetrapyrrole chromophore covalently linked to a polypeptide.

phytoecdysone (*sometimes*) any **ecdysteroid** found in plants.

phytoene a C₄₀ carotenoid, derived by head-to-head combination of two molecules of geranylgeranyldiphosphate catalysed by phytoene synthase within the plastids of leaves of many plant species. It is the precursor of ζ -carotene, lycopene, β -carotene, and various xanthophylls.

phytoferritin a protein, similar to **ferritin** of animals, that occurs almost exclusively in plastids, especially in those of plant storage organs.

phytglycogen plant glycogen; a highly branched polymer of D-glucose, with a structure similar to that of animal **glycogen**, found in fungi, corn (maize), and rice. A similar substance is found in bacteria and cyanobacteria.

phytohemagglutinin or (*esp. Brit.*) **phytohaemagglutinin 1 abbr.:**

PHA; or **phytomitogen** the **lectin** from the red kidney bean, *Phaseolus vulgaris*; a potent mitogen. **2** a rare alternative name for **phytoagglutinin**.

phytohormone or **plant hormone** any plant growth factor or similar substance that regulates plant development. The group includes **abscisic acid**, **auxins**, **ethylene**, **cytokinins**, and **gibberellins**.

phytokinin an alternative term for **cytokinin**.

phytol a trivial name for *trans*- (or *E*-) (7*R*,11*R*)-3,7,11,15-tetramethyl-2-hexadecen-1-ol; the pure substance is a colourless oily liquid. Phytol occurs in combined form in chlorophyll and vitamin K₁. In animals it is oxidized to **phytanic acid**, which then undergoes alpha oxidation. See also **phytyl**.

phytylosome a **lysosome** of plant cells.

phytohemagglutinin an alternative name for **phytohemagglutinin** (def. 1).

phytoplankton plant plankton; consisting of diatoms, dinoflagellates, and other microscopic algae.

phytoporphyrin any plant **porphyrin**.

phytosiderophore any of various organic iron-chelating molecules secreted by the roots of different species of the grass family (including oat, barley, wheat, and rice). The iron-phytosiderophore complex enters the roots through an iron transporter in the plasma membrane. The two that have been characterized are the nonprotein amino acids mugineic acid (of barley) and avenic acid (of oats). Both are derived from the α -aminobutyrate moieties of three *S*-adenosylmethionine molecules by the action of nicotianamine synthase.

phytosphingosine 2*S*,3*S*,4*R*-2-amino-1,3,4-octadecanetriol; a constituent of many plant sphingolipids.

phytosterol any sterol occurring in higher plants; they differ from animal sterols in having C₁ or C₂ residues at C-24 and/or a double bond at C-22.

phytotoxic toxic to a plant.

phytoxin 1 any toxin produced by a plant. **2** any substance that is toxic to a plant or plants.

phytotron a laboratory where plants can be grown and studied under a variety of controlled conditions.

phytyl the alkyl group, (CH₃)₂-CH-[CH₂]₃-CH(CH₃)-[CH₂]₃-CH(CH₃)-[CH₂]₃-C(CH₃)=CH-CH₂-, (*E*)-(7*R*,11*R*)-3,7,11,15-tetramethyl-2-hexadecenyl, derived from **phytol**.

pi 1 *symbol*: π (lower case) or Π (upper case); the sixteenth letter of the Greek alphabet. For uses see **Appendix A. 2** (*in mathematics*) *symbol*: π ; a transcendental number that is the ratio of the circumference of a circle to its diameter. It has the approximate value 3.141 592 653 59.

pi *symbol* for isoelectric point.

PI *abbr.* for phosphatidylinositol.

pi adduct or **π adduct** any adduct formed by coordination and involving donation of an electron pair from a **pi orbital** into a **sigma orbital**, from a sigma orbital into a pi orbital, or from a pi orbital into a pi orbital. It is also known, less correctly, as a **pi complex**.

PIAS *abbr.* for protein inhibitor of activation by STAT; a human nuclear protein that inhibits transcriptional activation by STAT3 (see **STAT**). It contains a SAP (DNA-binding) domain and a zinc finger domain. Orthologues are present in other vertebrates.

pi bond or **π bond** the type of covalent bond formed between atoms by electrons occupying a **pi orbital**.

picein (wax) an unreactive thermoplastic material, composed of a mixture of hydrocarbons of very low vapour pressure, that adheres well to glass and metal. It is useful as a sealing substance in the assembly of vacuum systems.

Pichia see **methylotrophic yeasts**.

picket-fence (porphyrin) complex any synthetic iron-porphyrin complex in which the porphyrin has been derivatized with four large groups attached to one side of the porphyrin ring, to each of the inter-pyrrole carbon atoms, so as to form a protective enclosure for the binding of a dioxygen molecule as in **myoglobin** or **hemoglobin**.

pico+ *symbol*: p; SI prefix denoting 10⁻¹² times.

picogram *symbol*: pg; a unit of mass equal to 10⁻¹⁵ kilogram or 10⁻¹² gram.

picometre or (*US*) **picometer** *symbol*: pm; a unit of length equal to 10⁻¹² metre.

picomolar *symbol*: pm or pM; describing a solution containing one picomole of solute per litre of solution, or a specified multiple or fraction thereof; used also of a substance concentration similarly expressed.

picomole *symbol*: pmol; a unit of amount of substance equal to 10⁻¹² mole.

pi complex or **π complex** a less suitable name for **pi adduct**.

picoplankton plankton having cell dimensions of between 0.2 and 2 μ m and including bacteria, cyanobacteria, some algae, and certain microscopic protozoans. Picoplankton appears to be ubiquitous in open waters of lakes and seas and probably exceeds in total biomass any other group of pelagic organisms.

picornavirus any RNA animal virus consisting of naked, icosahedral 27 nm capsids with single-stranded infectious RNA (plus strand) of 2.7 MDa. The group includes human poliovirus, some common-cold viruses, and foot-and-mouth disease virus (of cattle and other cloven-footed mammals).

picosecond *symbol*: ps; a unit of time equal to 10⁻¹² second.

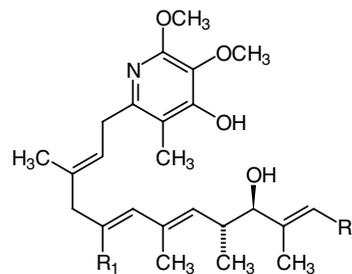

4-pi counter any type of radiation counter that detects radiation emitted through a solid angle of 4 π steradians, i.e. in all directions from a source.

picrotoxin or **occulin** a preparation containing an equimolar mixture of **picrotoxinin** (C₁₅H₁₆O₆) and **picrotin** (C₁₅H₁₈O₇) obtained from the seeds of *Anamirta cocculus* (fishberries). It contains a potent ligand for the chloride ionophore of the GABA_A receptor, binding to the channel protein and inhibiting Cl⁻ transport without displacing GABA; this endows it with potent convulsant activity. It can thus also act as an antidote to barbiturates, which enhance GABA binding. It is displaced from its binding site by anticonvulsants.

piebaldism see **KIT**.

pi electron or **π electron** an electron in a **pi orbital**.

piercidin A an antibiotic that is a structural analogue of **ubiquinone** and a classical inhibitor of mitochondrial electron transport similar in action to **rotenone**. It is a potent inhibitor of NADH:ubiquinone oxidoreductase (see **NADH dehydrogenase**), acting at or near the ubiquinone catalytic site.

pig 1 any nonruminant, omnivorous ungulate mammal of the family Suidae, especially the domestic pig, *Sus scrofa*. **2** *informal* short for **guinea pig**.

PIG *abbr.* for phosphatidylinositolglycan.

PIG-A *abbr.* for phosphatidylinositol glycan protein class A.

pigeon any stout-bodied bird of the family Columbidae, especially the domesticated or feral pigeon, *Columba livia*. Pigeon-breast muscle has been extensively used as a convenient tissue for the study of oxidative metabolism.

pigment 1 any general or particular colouring matter in living organisms. **2** any natural or artificial substance used to impart colour. **3** to colour with pigment.

pigment 680 see **P680**.

pigment 700 see **P700**.

pigmentation 1 natural coloration of organisms. **2** an increase in such coloration.

pigment system an alternative name for **photosystem**.

pigmenturia the presence of a component that imparts an abnormal colour to urine. The pigment may be endogenous (e.g. bilirubin diglucuronide, porphyrin, myoglobin, hemoglobin, blood, ho-

mogentic acid) or exogenous (e.g. beet, cascara, senna, levodopa, riboflavin, methylene blue).

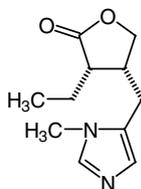

PI-G-tailed proteins proteins that are anchored to the membrane through linkage to phosphatidylinositol-glycan.

PIGylation the biosynthetic process whereby **PIG-tailed** proteins are produced.

pili the plural of **pilus**.

pilin any protein subunit of a bacterial **pilus**.

pilocarpine an alkaloid extracted from *Pilocarpus jaborandi*; it has muscarinic cholinomimetic activity.

pilosulin any of a family of peptidic channel-forming toxins, with about 100 amino acid residues, produced by various animals, particularly ants. Pilosulin is classified in the TC system under number 1.C.51.

pilot plant a prototype apparatus set up to develop and scale up a new manufacturing process.

pilus (*pl.* **pili**) a hairlike appendage, about 25 nm in diameter and 10–12 μm long, present sometimes on cells of certain Gram-negative bacteria, especially members of the Enterobacteriaceae and *Pseudomonas* spp., in addition to any flagella. The two main types, distinguishable morphologically and antigenically, are **common pilus** and **sex pilus**, both of which may be present on the same cell. Up to several hundred common pili per cell may be present, either distributed over the entire surface or concentrated at a pole; their function is not known. Only one or two sex pili commonly are present; they appear to be required for bacterial **conjugation**. Both types of pili are thought to be tubes or tubelike structures formed from one or two helically wound strands, each of which consists of a linear arrangement of molecules of the protein pilin. The term pilus is often used interchangeably with **fimbria**, but may be used specifically to mean sex pilus (in which case fimbria then denotes common pilus).

PIM a gene family encoding serine/threonine kinases of unknown function named from proviral integration site MuLV-induced murine T-cell lymphomas. They are highly conserved between human and mouse, and are expressed at high levels in hemopoietic tissues, testes and ovaries, and embryonic stem cells.

pl marker an **isoelectric point marker**; see **isoelectric point**.

PIN *abbr.* for protein inhibitor of neuronal nitric oxide synthase; a highly conserved 10 kDa protein from rat hippocampus that inhibits neuronal nitric oxide synthase.

pineal body or **pineal gland** a small, pine-cone-shaped structure situated deep between the cerebral hemispheres of the mammalian brain. It elaborates and secretes **melatonin**.

pineal hormone an older name for **melatonin**.

ping-pong mechanism an alternative name for **double-displacement (enzyme) mechanism**.

pinocytic an alternative term for pinocytotic (see **pinocytosis**).

pinocytic vesicle an alternative term for **pinocytotic vesicle**.

pinocytosis the process whereby cells take in liquid material from their external environment; literally 'cell drinking'. Liquid is enclosed in vesicles, formed by invagination of the plasma membrane. These vesicles then move into the cell and pass their contents to endosomes. Pinocytosis is the type of **endocytosis** occurring in most types of cells; hence the term is often applied interchangeably with endocytosis to such cells (*compare* **phagocytosis**). —**pinocytotic** or **pinocytic** *adj.*

pinocytotic vesicle or **pinocytic vesicle** a cellular vesicle serving **pinocytosis**; an alternative term to **endocytotic vesicle** when containing nonparticulate material.

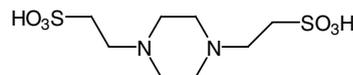

pinosome an alternative name for **endosome** (def. 1) (when containing nonparticulate material).

π orbital or **π orbital** a bonding molecular orbital formed by the in-phase, sideways-on overlap of parallel p atomic orbitals, one from each of two atoms, to produce a charge-density distribution that is mainly between the atomic nuclei but maximal in two zones, one on either side of and parallel to the internuclear axis. When occupied by two electrons of opposed spins it becomes the second bond in a double covalent bond (two such occupied orbitals, mutually orthogonal, providing the second and third bonds of a triple bond).

PIP or **PI 4-P** *abbr.* for phosphatidylinositol 4-phosphate.

PIP₂ or **PI 4,5-P₂** *abbr.* for phosphatidylinositol 4,5-bisphosphate.

Pipes or **PIPES** *abbr.* for 1,4-piperazinediethanesulfonic acid; a **Good buffer substance**; pK_a (20°C) = 6.8.

pipette or (*US*) **pipet 1** any device for transferring or delivering (usually measured) volumes of liquid and commonly consisting of a slender, calibrated glass or plastic tube with a finely drawn-out delivery tip and (for larger volumes) a centrally placed bulb. It may be filled by applied suction or by capillarity (according to its bore), and emptied by drainage or by applied pressure. **2** to transfer or deliver a (usually measured) volume of liquid with a **pipette** (def. 1). — **pipettable** *adj.*

pipettor any device for the rapid, repetitive dispensing of a predetermined volume of a liquid.

pipsyl *symbol:* Ips; *p*-iodophenylsulfonyl; I-C₆H₄-SO₂; a chemical group with which free amino groups may be derivatized by reaction with pipsyl chloride, *p*-iodophenylsulfonyl chloride. *Compare* **tosyl**.

pipsylate to convert (an amino compound) to a **pipsyl** derivative. — **pipsylation** *n.*

Pirani gauge an electric gauge for low gas pressures that functions over the range 10⁻² to 10⁻⁵ mm Hg. It depends on the principle that an electrically heated wire loses heat by conductivity, and thus varies in electric resistance, to an extent empirically dependent on the pressure of the surrounding gas.

PIR-PSD *abbr.* for protein identification resource-protein sequence database; see **sequence database**.

piscine of, relating to, or being a fish.

pitch height (of a helix) *symbol:* *p*; the linear displacement along the axis of a helix corresponding to one complete turn of the helix.

PIT any of three closely related homeobox genes for positive transcription factors (Pit). Pit-1 activates the genes for somatotropin, prolactin, and the β subunit of thyrotropin, binding specifically to the consensus sequence 5'-TAAAT-3'. It contains a **POU domain** and contributes to the naming of the domain. Deficiency of Pit-1 leads to a syndrome caused by combined lack of somatotropin, prolactin, and thyrotropin. PITX2 (271 amino acids) and PITX3 (302 amino acids) are homologous with Pit-1. Mutations in either result in ocular defects.

Pitocin a proprietary name for (a solution of) **oxytocin**.

Pitressin a proprietary name for (a solution of) **vasopressin**.

pituitary 1 pertaining to or produced by the **pituitary gland**. **2** the pituitary gland.

pituitary adenylate cyclase-activating polypeptide see **PACAP**.

pituitary function see **combined test of pituitary function**.

pituitary gland or **hypophysis (cerebri)** the most important endocrine gland of vertebrates. It is situated below the brain, to which it is attached by a stalk, and measures about 8 mm by 12 mm in an adult human. It consists of two parts: the anterior lobe, or **adenohypophysis**, and the posterior lobe, or **neurohypophysis**; both lobes secrete a range of hormones.

Pituitrin a proprietary name for an aqueous extract of bovine neurohypophysis; it contains both oxytocin and vasopressin.

PIVKA *abbr.* for protein induced by vitamin K absence; examples are the abnormal proteins produced in vitamin K-deficient animals, corresponding to coagulation factors II, VII, IX, and X (see **blood**

coagulation) in which some glutamate residues have not been carboxylated to γ -carboxyglutamate residues.

pixel one of the very small units that make up the image on a cathode-ray tube. [From 'pix' (i.e. pictures) + el(ement).]

pK *symbol* for the decadic logarithm of the reciprocal of a (thermodynamic) dissociation constant, K ; i.e.

$$\text{p}K = \log 1/K = -\log_{10}K.$$

The type of constant may be indicated by a subscript: e.g. $\text{p}K_{\text{a}}$, a dissociation constant of an acid; $\text{p}K_{\text{b}}$, a dissociation constant of a base; $\text{p}K_2$, a second dissociation constant. For the dissociation of an acid, HA, to its ions, H^+ and A^- ,

$$K = [\text{H}^+][\text{A}^-]/[\text{HA}].$$

Thus when $[\text{A}^-] = [\text{HA}]$, i.e. when the acid is half-dissociated, $K = [\text{H}^+]$, and hence $\text{p}K$ is then equal to pH . Formerly symbolized as $\text{p}K$. See also **group pK**, **Henderson–Hasselbalch equation**, **molecular pK**, **titration pK**.

pK *symbol* for the decadic logarithm of the reciprocal of an apparent (concentration) dissociation constant, K' .

pK₂ see **pK**.

pK_a see **pK**.

pK_b see **pK**.

pK_w *symbol* for the decadic logarithm of the reciprocal of the ion product of water, K_{w} .

PK (in clinical chemistry) *abbr.* for pyruvate kinase.

PKB *abbr.* for protein kinase B.

PKC *abbr.* for protein kinase C.

PKD 1 repeat a protein sequence (80–90 amino acids) that occurs 15 times in the N-terminal extracellular region of polycystin 1. It forms seven beta strands organized in two sheets with a well-defined hydrophobic core.

PKR *abbr.* for RNA-activated protein kinase; a protein kinase that contains two dsRNA-binding motifs and is activated by binding dsRNA and by homodimerization. It is induced by interferon, and it phosphorylates the α subunit of the initiation factor eIF-2, the regulatory I κ B subunit of the NF- κ B transcription factor, and the tumour suppressor p53.

PKU *abbr.* for phenylketonuria.

PL *abbr.* for 1 placental lactogen (i.e. **choriomammotropin**).

placebo (*pl. placebos or placeboes*) a tablet, capsule, or liquid medicine devoid of any specific pharmacological activity, but appearing identical to a preparation containing a biologically active substance. Placebos are used in human medicine for their psychological effects, and as controls in experimental therapeutics for elucidating the clinical actions of a drug.

placenta (*pl. placentas or placentae*) a highly vascularized organ within the uterus of a pregnant animal by which the embryo is attached to the uterine wall and through which the embryo can exchange solutes with the maternal circulation. The placenta also functions as an endocrine gland, secreting *inter alia* **choriogonadotropin**, **choriomammotropin**, and certain steroid hormones. —**placental adj.**

placental lactogen *abbr.*: PL; *an alternative name for* **choriomammotropin**.

placental ribonuclease inhibitor or **placental ribonuclease/angiogenin inhibitor** a 15 kDa protein with 15 leucine-rich repeats found in mammalian tissues and conveniently extracted from placenta. It binds with a very high affinity to many RNases thereby inhibiting them. It is used in experiments with purified RNA to minimize degradation by contaminating RNases. It also inhibits angiogenin.

plakoglobin or **desmoplakin III** a protein of **cell junctions**. It is thought to play a central role in the function of desmosomes and intermediate junctions.

planar 1 of, or pertaining to, a **plane**. 2 lying in one plane; flat.

planchet or **planchette** a small, shallow dish used to contain a specimen for determination of its radioactivity with an end-window or windowless counter.

Planck constant *symbol*: h ; a fundamental constant of proportionality between the frequency, ν , of electromagnetic radiation and the energy, E , of a quantum of the radiation; i.e. $h = E/\nu$. It has a value

of $6.626\,075\,5(40) \times 10^{-34}$ J s. [After Max Karl Ernst Ludwig Planck (1858–1947), German physicist.]

plane 1 a surface in which a straight line joining any two contained points lies entirely within the surface; a flat surface. **2** an imaginary surface of such a kind within a real structure or lying conceptually in space. **3** lying wholly in one plane; flat or level; planar.

plane of polarization or **plane of polarisation** (of linearly polarized light or other electromagnetic radiation) the plane containing the electric vectors of the vibrations.

plane of symmetry a plane through a three-dimensional structure, e.g. a crystal or molecule, that divides the object into two parts that are mirror images of each other.

plane-polarized or **plane-polarised** *an alternative term for* **linearly polarized**. See **polarized light**.

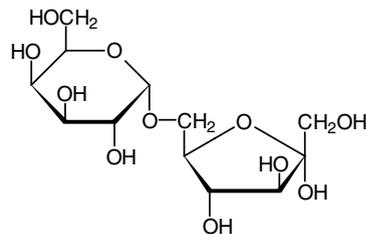

planimeter a mechanical integrating instrument for measuring the area of an irregular plane figure. It consists of a moveable tracing arm, which is made to follow the boundary of the figure, and a dial on which the arm's motion is recorded. —**planimetry** *n.*

plankton *the collective term for* the small or microscopic plants (**phytoplankton**) and animals (**zooplankton**), that drift freely in the surface waters of lakes, seas, and oceans.

plant any organism of the kingdom Plantae. Plants are characterized by their ability to effect photosynthesis and the possession of rigid cell walls that contain cellulose.

plant cell-wall protein any of four major classes of proteins that form networks in plant cell walls. They are: **hydroxyproline-rich glycoproteins** (HPRG); **proline-rich proteins** (PRP); **glycine-rich proteins** (GRP); and arabinogalactan proteins (AGP).

planteobiose the disaccharide, 6-*O*- α -D-galactopyranosyl-D-fructose; a unit of the trisaccharide **planteose**.

α -anomer

planteose *O*- α -D-galactopyranosyl-(1 \rightarrow 6)-*O*- β -D-fructofuranosyl-(2 \rightarrow 1)- α -D-glucopyranoside; a trisaccharide isolated from defatted seeds of *Plantago ovata*.

plant glucosyltransferase *an alternative name for* **D-enzyme**.

plant hormone *an alternative term for* **phytohormone**.

plantibody a human antibody produced by genetically engineered tobacco plants.

plaque 1 any small disk-like object, patch, or zone. 2 a macroscopic or microscopic rounded clear zone in a layer of cells or bacterial lawn that results from the killing or lysis of adjacent cells by the action of a virus or other agent. 3 **a** (a patch of) fibrous or lipid material on the inner surface of an artery. **b** an area of tissue degeneration with distinctive histological features characteristic of certain (especially neurological) diseases, e.g. **kuru**, **multiple sclerosis**. **c** a deposit of β -amyloid, numbers of which are typically found in the brains of patients with Alzheimer's disease. 4 (a patch of) deposit closely adherent to the surface of a tooth that contains a mixed microbial flora and is composed largely of extracellular bacterial polysaccharide.

plaque-forming unit see **pfu**.

plaque-lift a technique used in recombinant DNA technology for screening DNA libraries constructed in bacteriophages such as lambda. Plaques of recombinant phage are allowed to form on a lawn of bacteria spread on a nutrient agar plate. Then a nitrocellulose (or nylon) membrane is pressed against the surface thereby adsorbing phage from the plaques in a replica pattern. The membrane

can then be screened with a DNA probe, or antibody for an expressed protein if appropriate, and the desired clones identified.

+plasia or **+plasy** *comb. form* indicating development or growth. —**+plastic** *adj.*

plasm+ *a variant form of plasm+* (before a vowel).

+plasm *comb. form* denoting the colloidal material of which living cells are composed. —**+plasmic** *adj.*

plasma **1** the proteinaceous fluid in which the cells of blood or lymph are suspended; the meaning is sometimes extended to include also the analogous fluid in which the fat droplets of milk are suspended. *See also* **blood plasma**. **2** *a less common word for protoplasm*. **3** (*in physics*) any region of highly ionized gas (as in a gas-discharge tube, a hot flame, or a thermonuclear reaction) containing approximately equal numbers of electrons and positively charged ions. It differs from ordinary gas in being a good conductor of electricity and being affected by a magnetic field. —**plasmatic** or **plasmic** *adj.*

plasma albumin *an alternative name for serum albumin*.

plasma cell or **plasmacyte** or **plasmocyte** a fully mature antibody-secreting B lymphocyte, found in lymphoid tissue and in connective tissue liable to encounter foreign material. It has an eccentrically placed nucleus, basophilic cytoplasm, and an unusually large amount of rough endoplasmic reticulum.

plasma cholesterol (*in medical biochemistry*) the concentration of cholesterol in blood plasma. In human blood, cholesterol occurs as a component of all plasma lipoproteins, but especially **very-low-density lipoprotein**, **low-density lipoprotein**, and **high-density lipoprotein**. A correlation exists between the level of plasma cholesterol and the occurrence of **atheroma** and heart attacks; this is associated with the role of low-density lipoprotein, which has the highest concentration of cholesterol and distributes cholesterol to the tissues. However, the ratio of high-density lipoprotein cholesterol to low-density lipoprotein cholesterol must be taken into account, as the former is thought to have a protective function in cycling cholesterol from peripheral tissues back to the liver. The circulating level of cholesterol may be altered by diabetes, thyroid hormone imbalance, diet, and drugs. It is thought that the level of circulating total cholesterol should be maintained below about 5 mmol L⁻¹.

plasma clearance *see clearance* (def. 2).

plasmacyte *an alternative name for plasma cell*.

plasmacytoma a tumour of plasma cells; most such tumours secrete myeloma proteins belonging to the same category as monoclonal antibodies.

plasma kallikrein *see kallikrein*.

plasmalemma *an alternative term for cell membrane*.

plasma lipid transfer protein a plasma protein that mediates transfer and exchange of lipids (i.e. phospholipid, cholesterol ester, triacylglycerol) between plasma lipoproteins. **Phospholipid transfer protein** and **cholesterol ester transfer protein** belong to this group; they are homologous with each other and with **lipopolysaccharide-binding protein**.

plasmalogen any glycerophospholipid in which the glycerol moiety bears an *O*-(1-alkenyl) group at position 1. The term embraces **plasmenic acid**.

plasmalogen synthase EC 2.3.1.25; an enzyme that catalyses the formation of plasmenylcholine from acyl-CoA and 1-*O*-alk-1-enyl-*sn*-glycero-3-phosphocholine with release of CoA.

plasma membrane *an alternative term for cell membrane*.

plasmenic acid a derivative of *sn*-glycerol 3-phosphate in which the glycerol moiety is etherified with an alkyl (or alkenyl other than 1-alkenyl) group at position 1 and esterified with an acyl group at position 2; i.e. any 2-acyl-1-*O*-R-*sn*-glycerol 3-phosphate where R = alkyl or *n*-alkenyl when *n* > 1. *Compare* **plasmenic acid**.

plasmanyl *the trivial name for any phosphoric acyl group derived from a plasmenic acid*. The term is useful for naming phosphoric diesters of plasmanic acid, e.g. plasmanylethanolamine, 2-acyl-1-*O*-alkyl-*sn*-glycerol 3-phosphoethanolamine. *Compare* **plasmenyl**.

plasmapheresis or **plasmaphoresis** or **plasmapheresis** or **plasmapheresis** a technique for decreasing the protein content of blood plasma circulating in the body by withdrawing blood, separating the cells by centrifugation, and then returning them to the circulation as a suspension in a suitable protein-free medium.

plasma protein 1 any of the numerous proteins present in or de-

rived from blood plasma. **2** such proteins collectively. In mammalian plasma the concentration of plasma protein is 60–80 g L⁻¹; of this, ≈60% is serum albumin, ≈18% is immunoglobulin G, ≈9% is β₁-lipoprotein, and ≈4% is fibrinogen.

plasma thromboplastin antecedent *an alternative name for factor XI; see blood coagulation*.

plasmenic acid a derivative of *sn*-glycerol 3-phosphate in which the glycerol moiety is etherified with a 1-alkenyl group at position 1 and esterified with an acyl group at position 2; i.e. any 2-acyl-1-*O*-(1-alkenyl)-*sn*-glycerol 3-phosphate. *Compare* **plasmenic acid**, **plasmalogen**. [Contraction of plasmalogenic acid.]

plasmenyl or (*formerly*) **phosphatidal** *the trivial name for any phosphoric acyl group derived from a plasmenic acid*. The term is useful for naming phosphoric diesters of plasmanic acid, e.g. plasmenylethanolamine, 2-acyl-1-*O*-(1-alkenyl)-*sn*-glycerol 3-phosphoethanolamine. *Compare* **plasmanyl**.

plasmid strictly any extrachromosomal genetic element; however, mitochondrial and chloroplast DNA, yeast killer, and other cases are commonly excluded, hence the term plasmid generally refers to an extrachromosomal covalently continuous double-stranded DNA molecule that occurs in bacteria and (rarely) other microorganisms. Natural plasmids vary from <5 kb to over 100 kb in size. They are classified in a number of different ways: the **copy number** describes the ratio of plasmid/chromosome molecules, and is greatly influenced by the nature of the origin of replication. Plasmids under stringent control have a copy number of one and those under relaxed control may have copy numbers of hundreds per cell. The **host range** describes the variety of species that can act as host (*see also incompatibility*). Plasmids capable of transfer are said to be conjugal; wide host-range, conjugal plasmids are described as promiscuous. Plasmid genes include drug resistance (**resistance plasmids**), genes for catabolic enzymes (catabolic plasmids), genes for antibiotic synthesis, and genes for toxin production. Plasmids are popular choices for **cloning vectors**, and is greatly influenced by the nature of the origin of replication. Plasmids under stringent control have a copy number of one and those under relaxed control may have copy numbers of hundreds per cell. The **host range** describes the variety of species that can act as host (*see also incompatibility*). Plasmids capable of transfer are said to be conjugal; wide-host-range conjugal plasmids are described as promiscuous. Plasmid genes include drug resistance (**resistance plasmids**), genes for catabolic enzymes (**catabolic plasmids**), genes for antibiotic synthesis, and genes for toxin production. Plasmids are popular choices for **cloning vectors**.

plasmid chimera a hybrid DNA molecule that has been constructed *in vitro* by joining fragments of separate plasmids and that forms a new, biologically functional replicon when inserted into a cell.

plasmid curing the elimination of a plasmid from a cell culture by treatment with **Acridine Orange** at a concentration insufficient to inhibit chromosome replication but sufficient to inhibit plasmid replication.

plasmid engineering genetic engineering when a plasmid is used as a cloning vector.

plasmid incompatibility *see incompatibility*.

plasmid segregation *see segregation* (def. 3).

plasmid transconjugant *see transconjugant*.

plasmid vector *see cloning vector*.

plasmin or **fibrinolysin** or **fibrinase** EC 3.4.21.7; a serine proteinase that converts the insoluble fibrin of a blood clot into soluble products. It is formed from **plasminogen** by proteolysis, the heavier A chain being derived from the N-terminal part of plasminogen and linked by a disulfide bond with the lighter B chain, which contains the enzymically active site. It exhibits preferential cleavage at Lys-|Xaa > Arg-|Xaa bonds, with a higher selectivity than trypsin. *See also* **blood coagulation**.

plasminogen or **profibriinolysin** a ≈90 kDa, single-polypeptide glycoprotein found in blood plasma. It is the inactive precursor of **plasmin**, into which it may be converted by hydrolysis of one peptide bond (Arg⁵⁶⁰-|Val⁵⁶¹) brought about, e.g., by the action of **plasminogen activator** or **streptokinase**. *See also* **blood coagulation**.

plasminogen activator any serine proteinase that converts plas-

minogen into plasmin. Numerous variants occur in different tissues, and can be classified immunologically into **urokinase-type** and **tissue-type** plasminogen activators (*abbr.*: UPA and TPA, respectively). Example 1, urokinase-type (EC 3.4.21.73); this cleaves the Arg⁵⁶⁰-|-Val⁵⁶¹ bond in plasminogen to form plasmin. It is found in urine, and is used clinically for therapy of thrombotic disorders. Example 2, tissue-type (EC 3.4.21.68); this cleaves the Arg⁵⁶⁰-|-Val⁵⁶¹ bond in plasminogen to form plasmin. Cleavage after Arg³¹⁰ by plasmin or trypsin results in a two-chain form of the molecule; the two halves are held together by one or more disulfide bonds. TPA is active in tissue remodelling and destruction, in fibrinolysis, and in cell migration. Example 3, found in certain pathogens, is the activator EC 3.4.21.-, *also known as* coagulase/fibrinolysin precursor; it is a homopentamer occurring in the outer membrane. *See also* **urokinase**.

plasmo+ or (*before a vowel*) **plasm+** *comb. form* denoting of, pertaining to, related to, or derived from plasma.

plasmocyte *an alternative name for plasma cell.*

plasmodesma (*pl. plasmodesmata or plasmodesmas*) a fine cytoplasmic channel, found in all higher plants, that connects the cytoplasm of one cell to that of an adjacent cell. It is a roughly cylindrical, membrane-lined channel of diameter 20–40 nm, through the centre of which runs a narrower cylindrical **desmotubule**; the latter appears to be continuous with elements of the endoplasmic reticulum membrane of each of the connected cells. The function of plasmodesmata appears to be similar to that of **gap junctions** between animal cells. They permit passage of molecules of M_r less than about 800.

plasmodium (*pl. plasmodia*) **1** any member of the protozoan genus *Plasmodium*. Certain species parasitize humans causing malaria, while others parasitize other mammals. Their life cycle is complex, requiring, at different stages, an insect host and a mammalian host. **2** the motile multinucleate mass of protoplasm formed by the true **slime moulds** (Myxomycetes).

plasmolipin a protein of the myelin and lymphocyte (MAL) family of **tetraspanins**. It may be involved in vesicle trafficking and membrane linking.

plasmolysis temporary shrinkage of the protoplasm of a plant or bacterial cell away from the cell wall, caused by the withdrawal of water from the cell. —**plasmolyse** *vb*.

plasmon **1** the sum total of the extrachromosomal hereditary determinants in a cell. **2** in physics, a quasi-particle resulting from the quantization of plasma oscillations in a conducting material such as a metal. A surface plasmon occurs at the interface of a metal with material such as a protein, and interacts strongly with light. Plasmons are exploited as a way of observing binding of macromolecules to metal surfaces in **surface plasmon resonance**.

plasmoptysis the localized extrusion of cytoplasm through the cell wall of a bacterium.

plasmosome *an alternative name for nucleolus.*

+plast *comb. form* denoting an organized subcellular particle from a living organism.

plastein a gel that may be formed on treating a partial hydrolysate of a protein with an endopeptidase. It was once thought to be a demonstration of the synthetic capability of proteases.

plastic **1** any of a large and diverse group of polymeric materials, either synthetic or semisynthetic, that may be obtained following moulding, extrusion, etc. at a stage in their manufacture when soft or liquid. **2** made of or containing plastic; of the nature of plastic. **3** (of a material) capable of being formed or moulded. **4** (*in biology*) of or pertaining to an ability to adapt to the environment; able to change, develop, or grow. —**plasticity** *n*.

+plastic *see* **+plasia**.

plasticity-related gene-1 *see* **PRG-1**.

plasticizer or **plasticiser** any substance added to another to render the latter less brittle and/or more mouldable and flexible.

plastid any of the organelles found in the cytoplasm of eukaryotic plants that contain DNA, are bounded by a double membrane, and develop from a common type, the **proplastid**. Plastids also contain pigments and/or storage materials. They include **aleuoplasts**, **amyloplasts**, **chloroplasts**, **chromoplasts**, **elaioplasts**, and etioplasts.

plastidome the total complement of **plastids** of a cell.

plastocyanin a soluble protein of eukaryotic plants that contains

one atom of copper per molecule, and is blue in its oxidized form. It occurs in the chloroplast at a molar concentration equal to that of P700, where it functions as a one-electron carrier ($E'_o = +0.43$ V) between the cytochrome b_6-f and P700 of photosystem I. It is loosely bound to the inner thylakoid membrane surface.

plastogene any of the hereditary determinants of plastids.

plastoglobuli droplets, 50–220 nm in diameter, that occur close to thylakoid membranes in chloroplasts of senescing leaves. Rich in lipids, particularly **plastoquinone**, they are particularly numerous when thylakoids are disrupting, and appear to be liberated therefrom.

plastome or **plastom** the total complement of the **plastogenes** of a cell.

plastoquinol *abbr.*: PQH₂; any hydroquinone derived from the corresponding plastoquinone by a two-electron reduction.

plastoquinone *abbr.*: PQ; any 2,3-dimethyl-5-multiprenylbenzoquinone; plastoquinones occur mainly in plants; intact prenyl units in the side chain (commonly nine in the plastoquinone of higher plants) may be designated by a suffixed numeral, e.g. plastoquinone-9 (*abbr.*: PQ-9). The plastoquinone–plastoquinol redox system ($E'_o \approx +0.1$ V) functions in the electron-transport system, transferring electrons from photosystem II to the cytochrome b_6-f complex.

plate 1 (*in biology*) a Petri dish or other shallow vessel containing so-called solid or semisolid culture medium; a culture grown on this. **2** (*in chemistry*) any one of the horizontal perforated plates that comprise the fractionating component of a **plate column** for fractional distillation, or the theoretical equivalent of such a plate. *See also* **theoretical plate**. **3** (*in biology*) or **plate out** to inoculate a **plate** (def. 1) with microbial or other cells, or with material (suspected of) containing such cells. **4** to coat (a metal or other substrate) with a thin layer of (other) metal.

plateau (*pl. plateaux or plateaus*) **1** a part of a graph in which the value of the ordinate shows little or no change with increasing value of the abscissa. **2** a period of (relative) stability in the course of a progression. **3** to reach or pass through a plateau.

plate column *see* **plate** (def. 2).

plate height *see* **height equivalent to a theoretical plate**.

platelet or **thrombocyte** the smallest of the blood cells. It is an anucleate biconvex disk, 2–3 μ m in diameter, formed by division of the cytoplasm of a megakaryocyte. Platelets have an exterior coat rich in glycoprotein, a normal cell membrane, and a well-developed system of microtubules some of which are arranged as an equatorial ring. Their main functions are in hemostasis, by (1) adhering to damaged blood vessels and aggregating to form a plug; (2) releasing various vasoconstrictive agonists, e.g. **epinephrine**, **serotonin**, and **thromboxane A₂**; (3) activating or binding certain coagulation factors; and (4) releasing factor XIII, **platelet-derived growth factor**, and **platelet factor IV**; blood clotting then occurs around the aggregated platelets. *See* **blood coagulation**.

platelet-activating factor *abbr.*: PAF or PAF-acether; 1-*O*-alkyl-2-acetyl-*sn*-glycerol 3-phosphocholine, where 'alkyl' may be hexadecyl or octadecyl; a potent general inflammatory mediator released from a variety of cells in response to a number of stimuli, and causing aggregation of platelets, activation of polymorphonuclear leukocytes, monocytes, and macrophages, mediation of increased vascular permeation, hypotension, decreased cardiac output, and stimulation of uterine contraction. It is synthesized in the cell in either of two ways: (1) from 1-*O*-alkyl-*sn*-glycerol-3-phosphate by addition of an acetyl group and release of phosphate, forming 1-alkyl-2-acetyl-*sn*-glycerol, which then reacts with CDPcholine to form PAF and CMP; or (2) by a remodelling pathway, in which the 2-fatty acyl group is removed from a phosphatidylcholine by phospholipase A₂ and replaced with acetyl. A number of analogues act as PAF agonists, e.g. the stable analogues in which the 2-acetyl group is replaced by an ethyl, methyl, or benzyl ether group; replacement of the choline moiety by (*N*-methylpyrrolidino)ethanolamine greatly increases its effect. PAF antagonists include gossypol, hexanolamino-PAF, *bis*(methylthio)gliotoxin, and 2,5-*bis*(3,4,5-trimethoxyphenyl)-1,3-dioxolane.

platelet-activating factor acetylhydrolase (*abbr.*: PAF-AH) *an alternative name for* **lipoprotein-associated phospholipase A₂**.

platelet basic protein precursor *abbr.*: PBP; the precursor of several peptides generated by alternative processing. For example, the human protein contains a signal, platelet basic protein, LA-PF4, β -thromboglobulin and NAP-2.

platelet-derived endothelial cell growth factor *abbr.*: PD-ECGF; a **cytokine** produced by platelets, fibroblasts, and smooth muscle cells. It is a monomer of 471 amino acids. A related protein, **gliostatin**, is produced by astrocytes. Both proteins stimulate growth of endothelial cells *in vitro* and angiogenesis *in vivo*, and promote survival and differentiation of CNS neurons; they inhibit the growth of astrocytes and glial cells. PD-ECGF proteins initiate thymidine phosphorylase activity.

platelet-derived growth factor *abbr.*: PDGF; a **cytokine** of ~30 kDa, composed of two disulfide-bonded polypeptide chains, denoted A and B, which are non-identical but homologous. It is believed that human PDGF is an AB heterodimer, but pig PDGF is a homodimer of B chains. PDGF is a potent mitogen for cells of mesenchymal origin (endothelial cells, epithelial cells, some fibroblasts, smooth muscle cells) and for glial cells; it has chemotactic properties. It is released by platelets on wounding, and stimulates nearby cells to grow and repair the wound; it is also produced by endothelial cells, fibroblasts, monocytes, macrophages, smooth muscle cells, and neurons. PDGF-like proteins are produced by numerous human tumour cell lines, and the B chain is almost identical to part of the transforming protein produced by simian sarcoma virus (*see sis*). Homodimers of A and B chains (both can bind to the receptor) are implicated in transformation processes. *See also* **platelet-derived growth factor receptor**.

platelet-derived growth factor receptor or **PDGF receptor** a **tyrosine kinase** dimer, of $\alpha\alpha$, $\beta\beta$, or $\alpha\beta$ subunits, belonging to the immunoglobulin superfamily. It is a transmembrane cell surface receptor, the intracellular kinase sequence being split by an inserted sequence. Binding of platelet-derived growth factor (PDGF) stimulates tyrosine-kinase activity, which leads to phosphorylation of tyrosine residues.

platelet endothelial cell adhesion molecule *see* **PECAM**.

platelet factor IV a polypeptide secreted by platelets when they adhere at a site of injury. It is a **chemokine** that binds heparin strongly, and is a powerful attractant for neutrophils and monocytes.

platform protein an *alternative name for molecular beacon*.

plating *see* **plate** (def. 3, 4).

platysome (*sometimes*) the core particle of a **nucleosome**.

PLC *abbr. for* 1 preparative-layer chromatography. 2 phospholipase C; *see* **phospholipase**.

pleated sheet *see* **beta-pleated sheet**.

pleckstrin *other name:* platelet p47 protein; a platelet protein that is the major substrate for Ser/Thr phosphorylation by protein kinase C. Its function is not known. *See also* **pleckstrin homology domain**.

pleckstrin homology domain *abbr.*: PH domain; a domain, first noted in the platelet protein **pleckstrin**, containing about 100 residues. Its function is unknown, but it has since been found in many (more than 60) proteins, especially those associated with intracellular signal transduction downstream of cell-surface receptors. It binds inositol-1,4,5-triphosphate.

plectin a coiled-coil protein that links intermediate filaments to hemidesmosomes. It is expressed in epidermis and skeletal muscle and is very similar in sequence to bullous pemphigoid antigen 1e. Null mutations in the gene are associated with epidermolysis bullosa with muscular dystrophy.

plectonemic coiling a type of coiling of a double-stranded helix in which the two strands are intertwined, i.e. they may not be separated without uncoiling.

pleiotropin or **pleiotrophin** *other name:* heparin-binding growth factor 8; a heparin-binding mitogenic protein with neurite extension activity for osteoblasts and brain cells.

pleiotropism or **pleiotropy** the phenomenon in which a single gene is responsible for producing multiple, distinct, apparently unrelated phenotypic effects; an instance of such a phenomenon. The meaning is sometimes extended to include multiple, distinct, unrelated actions or effects of a single polypeptide agonist. —**pleiotropic** *adj.*

pleiotypic relating to the process by which a single stimulus to a living cell elicits multiple, unrelated responses.

pleomorphism or **pleomorphy** the quality of occurring in, or exhibiting more than one distinct form. *Compare* **polymorphism**. — **pleomorphic** *adj.*

pleuropneumonia-like organism *abbr.*: PPLO; an *obsolete name for mycoplasma* or mollicute.

Plexiglas or **Plexiglass** a *proprietary name for poly(methyl methacrylate)*.

plexin any of a family of transmembrane proteins that form part of **semaphorin** receptor complexes. Their intracellular region binds directly to **RhoGTPases** and to Rho guanine nucleotide-exchange factors. Plexins are widespread in embryonal and adult tissues. They regulate axonal pathfinding in the developing nervous system. In *Drosophila*, plexin A is a receptor for semaphorin 1A. In vertebrates, plexin A is a receptor for secreted semaphorin 3, whereas plexins B, C, and D bind other semaphorins. Their extracellular N-terminal ~500 residues are homologous with the same region of semaphorin and hepatocyte growth factor receptors, but their intracellular ~600 residues show no known homology and might bind a cytosolic protein-tyrosine kinase.

PLI *abbr. for* pulsed laser interferometry.

+ploid *adj. and n. comb. form* indicating the specific multiple of homologous sets of chromosomes in cell. —**+ploidy** *n.*

ploidy the number of homologous sets of chromosomes in a cell, or in each cell of an organism.

P-loop *see* **Walker motif**.

plot 1 a diagram showing the relationship between two or more variables. 2 to construct such a plot.

plotter an instrument for automatically making a **plot** (def. 1).

PLP *abbr. for* 1 pyridoxal phosphate. 2 proteolipid protein; *see* **myelin proteins**.

PLTP *abbr. for* phospholipid transfer protein.

plug flow a type of flow of fluids in which there is no mixing in the direction of flow.

plumper a disposable, nonscratching plastic device for adding a small volume (5–50 μ L) of a reagent to, and mixing it with, a liquid in a small container such as a spectrophotometer cuvette.

pluripoietin granulocyte colony stimulating factor (G-CSF) precursor. Pluripoietin α is a second human hemopoietic colony stimulating factor produced by the human bladder carcinoma cell line 5637. *See* **colony stimulating factor**.

pluripotent 1 (of a biomolecule) capable of being converted (biologically) into more than one active product. 2 (of a cell) capable of differentiating into more than one alternative type of mature cell.

plus and minus screening a strategy used previously for isolating genes for gene products that are present in one type of cell and absent in another. It involves comparing the results of plaque or **colony hybridization** of replicate plates of a cDNA clone library from the first cell type with cDNA probes derived from the mRNAs of both cell types used independently. Any plaque or colony that hybridizes to one probe and not the other is a candidate of interest. The objective can now be achieved more conveniently using subtractive PCR methods.

plus end the end of a microtubule or actin filament at which addition of monomers occurs most readily; the 'fast-growing' end of a microtubule or actin filament. The plus end of an actin filament is also known as the **barbed end**.

plus strand 1 the parental polynucleotide strand in bacteriophages whose genomes consist of duplex RNA. It is the template used for the production of the complementary minus strand. 2 virus-specified messenger RNA, or any given strand of nucleic acid (RNA or DNA) whose base sequence is equivalent to that of virus-specified mRNA. Any strand having a base sequence complementary to virus-specified mRNA is described as a minus strand. 3 (*sometimes*) an *alternative term for coding strand* (of genomic duplex DNA). *Compare* **minus strand**.

PLZF *abbr. for* promyelocytic leukemia zinc finger protein; a transcription factor that is expressed in many tissues during development and may be involved in hemopoietic cell differentiation. It contains an N-terminal domain for protein–protein interaction and nine C-terminal zinc fingers, Krüppel-type (i.e. C_2H_2). The N-terminal domain binds the nuclear receptors RAR and RXR and inhibits their binding to DNA. Translocation of the PLZF gene at

11q23.1 with that for RAR α results in a PLZF-RAR α fusion protein in some acute promyelocytic leukemia patients.

pM or **pm** *symbol for picomolar.*

Pm *symbol for promethium.*

PMA *abbr. for phorbol 12-myristate 13-acetate; see phorbol ester.*

PmaCI a type 2 **restriction endonuclease**; recognition sequence: CAC \uparrow GTG.

PMAL vector any of a range of plasmid vectors used for the expression of foreign proteins in *E. coli*. Genes are cloned downstream from the gene for the *E. coli* maltose binding protein (MBP) *malE* and in the same reading frame. The resulting fusion protein can be purified on columns of cross-linked amylose. The leader sequence of *MalE* facilitates export to the periplasm. A short sequence motif at the point of fusion is recognized by factor Xa, which can be used to cleave the protein of interest from MBP.

PMB1 a plasmid replicon widely used in its original or modified form in the construction of synthetic plasmids used in molecular biology. Plasmids with pMB1 have copy numbers of 15–30.

PMc9 a plasmid encoding the *lac* repressor *I^h* and the gene for resistance to ampicillin. It is carried by *E. coli* strains such as Y1090 to control the expression of foreign genes cloned in bacteriophage lambda vectors and transcribed from *lac* or *tac* promoters.

PMF *abbr. for protonmotive force, or sometimes (facetiously), after its discoverer, Peter Mitchell force.* [After Peter Dennis Mitchell (1920–92), British biochemist.]

PML *abbr. for promyelocytic leukemia protein; a protein that occurs free in nucleoplasm and in association with other proteins in nuclear bodies.* The gene at 15q21 encodes a protein that contains a RING finger and a coiled-coil domain, and resembles **COPI** in structure, cell distribution, and dynamics. A translocation between the PML gene and the RAR α gene produces the fusion protein PML-RAR α and disrupts the nuclear bodies. Cytoplasmic aggregates of PML occur in virally infected, neoplastic, or inflamed tissue.

PML nuclear body *see nuclear body.*

PMN *abbr. for 1 pyridine mononucleotide. 2 polymorphonuclear (leukocyte).*

pmol *symbol for picomole.*

PMR or **pmr** *abbr. for proton magnetic resonance; see nuclear magnetic resonance spectroscopy.*

PMS *abbr. for 1 phenazine methosulfate. 2 pregnant mares' serum.*

PMSF *abbr. for phenylmethylsulfonyl fluoride.*

PMSG *abbr. for pregnant mares' serum gonadotropin.*

PN-1 *see nexin 1.*

PNA *abbr. for pentose nucleic acid (i.e. ribonucleic acid).*

PNAD *abbr. for protein NH₂-terminal arginine deamidase; an enzyme, discovered in the pig, that catalyses deamidation of N-terminal arginine residues in peptides.*

pneumo+ or **pneumono+** or (*before a vowel*) **pneum+** or **pneumon+** *comb. form of or pertaining to a lung or lungs; respiratory.*

pneumococcus (*pl. pneumococci*) any strain of bacterium belonging to the species *Streptococcus pneumoniae*. —**pneumococcal** *adj.*

pneumococcus capsule swelling reaction *an alternative name for Quellung reaction.*

p[NH]ppA *symbol for adenosine 5'-[β , γ -imido]triphosphate (alternative to AdoPP[NH]P).*

PNK *abbr. for polynucleotide kinase.*

PNMT *abbr. for phenylethanolamine N-methyltransferase.*

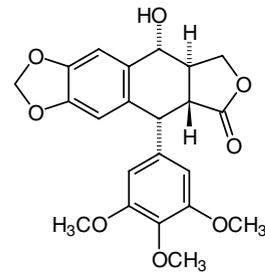

PNP *abbr. for 1 para-nitrophenol. 2 purine-nucleoside phosphorylase.*

Po *symbol for polonium.*

pocket (*in molecular biology*) a cavity or hollow in a three-dimensional structure, e.g. a substrate pocket of an enzyme.

podocalyxin a sialated glycoprotein that is prominently expressed on renal glomerular epithelial cells and found in patients with glomerulonephritis.

podophyllotoxin a **lignan** found in the May apple, or American mandrake (*Podophyllum peltatum*). It is known in folk medicine as a cathartic and poison, and is useful in topical treatment of warts, including venereal warts; it may have antiviral action. In mammalian cells it inhibits assembly of tubulin into microtubules, and also nucleoside transport. It is used in the synthesis of **Etoposide** and **Teniposide**.

podophyllotoxin

+poiesis *noun comb. form* indicating an act or process of making (something specified), e.g. erythropoiesis, hemopoiesis. —**+poietic** *adj.*

poikilo+ *comb. form* indicating various, variable.

poikilocyte an erythrocyte that is distorted in shape and usually larger than normal, found in the blood of persons with pernicious anemia and some other anemias.

poikilomotic describing an organism whose internal osmotic pressure varies with that of its environment. *Compare* **homoisomotic**.

poikilothermic or **poikilothermal** describing an organism whose body temperature varies with that of the environment. *Compare* **homoisothermic**. —**poikilotherm** *n.*

point 1 (*in mathematics*) **a** any dimensionless geometric element whose position in space is defined by its coordinates. **b** a location or position, especially on a diagram, graph, etc. **2** a decimal point. **3** a **point of inflection**.

point accepted mutation *symbol:* PAM; a unit that quantifies the amount of evolutionary change in a protein sequence. IPAM marks the evolutionary distance in which 1% of amino acids in a protein sequence have changed; 250PAMs represents 80% change.

point group 1 a notation used in describing the geometrical arrangement of the symmetry of globular oligomeric proteins. Such molecules may belong to any of the three point groups having **cyclic symmetry**, **dihedral symmetry**, or **cubic symmetry**. **2** (*in crystallography*) a group of symmetry operations that leave unmoved at least one point within the object to which they apply. It can describe single molecules or actual crystals.

point ligand any of two or more individual atoms or groups linked covalently to a specified carbon atom in an organic compound. Point ligands may be identical or nonidentical, but they may not occupy the same position in space.

point mutation any **mutation** (def. 1) involving a single base change. *See also* **transition**, **transversion**.

point of inflection any point on a graph where the direction of curvature changes.

poise *symbol:* P; the cgs unit of dynamic viscosity; it has the dimensions of g s⁻¹ cm⁻¹; 1 P = 0.1 N s m⁻². [After Jean-Louis Marie Poiseuille (1799–1869), French physician and physicist.]

Poiseuille's equation an equation describing the behaviour of a liquid flowing under pressure through a capillary tube of length *l* and radius *r*. The volume flowing per second, d*V*/dt, is given by:

$$dV/dt = \pi Pr^4/8\eta l,$$

where η is the viscosity of the liquid and *P* is the pressure difference of the liquid along the tube over a distance *l*. [After Jean-Louis Marie Poiseuille (*see* **poise**).]

poison 1 (*in toxicology*) any substance that, in relatively small amounts, can impair the functioning of, or cause structural damage to a cell or organism. **2** (*in chemistry*) any substance that, at relatively low concentrations, inhibits a chemical reaction or inactivates a catalyst. **3** to add or administer poison to (a cell, organism, catalyst, etc.).

pokeweed mitogen *abbr.:* PWM; a plant lectin (phytoagglutinin) extractable from the roots of pokeweed, *Phytolacca americana*, a North American plant. It is used in immunology and cell biology,

has an affinity for *N*-acetyl- β -D-glucosamine oligomers, and agglutinates leukocytes and erythrocytes (of all ABO blood groups). It also has mitogenic properties, which appear to reside in five (or more) separable components; one of these activates both T and B lymphocytes, and the others are specific for T lymphocytes.

poky mutant a mutant strain of *Neurospora* with a lower rate of growth than that of wild-type strains, due to absence or deficiency of certain components of the respiratory chain. The *poky* gene resides in mitochondrial DNA and is transmitted to sexually derived progeny only when the female parent exhibits the *poky* phenotype.

pol 1 a retroviral gene that encodes a polyprotein containing **retropepsin**, **reverse transcriptase**, and ribonuclease H (see **ribonuclease**). **2** as *polA*, *polB*, *polC*, genes that encode DNA polymerases I to III.

Pol the gene product of *polA*.

polA the structural gene in *Escherichia coli* for DNA polymerase I (Pol or Pol I; see **DNA polymerase**), which serves as a repair polymerase and as an exonuclease in the generation of **Okazaki fragments**. The enzyme belongs to family A of DNA polymerases and has three characteristic domains: 5'-exonuclease (amino acids 1–323), 3'-exonuclease (amino acids 324–517), and polymerase (amino acids 521–928). Klenow polymerase (amino acids 324–928) contains the latter two domains. See **Klenow enzyme**.

polar 1 pertaining to, or possessing, a **pole** or poles. **2** (*in chemistry*) (of a group or a molecular entity) having an uneven distribution of electrons and hence a permanent dipole moment. See also **polarity**.

polar body (*in biology*) either of the two small cells that form as a result of meiosis of a primary oocyte during its development to a mature ovum. One is formed in the first division, and the other in the second division. At each division, the cytoplasm divides unequally, the polar body being much smaller than the developing oocyte. At the second division the polar body and the developing oocyte each contains a haploid set of chromosomes. The polar bodies eventually degenerate.

polar bond 1 a covalent bond in which the electron pair(s) of the bond are held with greater force by one of the two bonded atoms leading to the existence of a permanent dipole moment in the group or molecular entity in question. **2** an ionizable bond between two oppositely charged ions of a salt.

polar coordinate (*in mathematics*) either of two numbers that locate a point in a plane, one being the distance along a line to the point from the origin and the other being the angle this line makes with a fixed line passing through the origin.

polar group see **polar** (def. 2).

polarimeter 1 an instrument for measuring the degree of polarization of light. **2** an instrument for measuring the rotation of the plane of vibration of linearly polarized light as a result of passing through a given length of optically active material. —**polarimetric** *adj.*; **polarimetry** *n.*

polarity 1 the state, or condition, of having **poles**. **2** having a differential distribution of a property or properties along an axis; see **polar**. **3** having opposing physical properties at different points, e.g. north and south magnetic poles, positive and negative electric charges, hydrophobic and hydrophilic regions. **4** the state of being electrically either positive or negative. **5** (of a solvent) **ionizing power**. **6** (of an organism) the tendency to develop differentially along an axis; e.g. plants exhibit polarity in developing roots downwards and stems upwards.

polarity gradient (*in genetics*) the quantitative effect of a **polar mutation** in one gene on the expression of later genes in the operon.

polarity mutant a mutant gene formed by a **polar mutation**.

polarizability or **polarisability** the quality of being able to be polarized.

polarization or **polarisation 1** inducing polarity. **2** the quality of being or becoming polarized.

polarization microscope or **polarisation microscope** an alternative name for **polarizing microscope**.

polarize or **polarise 1** to acquire or cause to acquire **polarity**. **2** to cause the polarization of light or other electromagnetic radiation; see **polarized light**. **3** to cause the electrical resistance of an electric cell to increase through the accumulation of electrolysis products at an electrode.

polarized light or **polarised light** light (or other electromagnetic radiation) in which the angular orientations of the electric vectors of its transverse vibrations are nonrandom. In **linearly** (or **plane-**) **polarized light** the electric vectors all lie in a given plane containing the light beam; to an observer looking along the light beam the vectors appear as a straight line through the axis of propagation. In **circularly polarized light** the angular orientations of the electric vectors are such that a given point on the vectors generates a (left-handed or right-handed) helix whose axis is the direction of the beam; to an observer looking along the light beam this point appears to describe the circumference of a circle, the light being defined as right or left circularly polarized depending on whether the point appears to the observer looking towards the source to be rotating clockwise or anticlockwise, respectively. Circularly polarized light may be considered to consist of two superimposed linearly polarized waves of equal amplitude but differing in phase by an odd number of quarter-wavelengths and having their electric vectors mutually at right angles; conversely, if right and left circularly polarized waves of equal amplitude are superimposed the resultant is a linearly polarized wave. In **elliptically polarized light** the angular orientations of the electric vectors are such that a given point on the vectors generates a (left-handed or right-handed) flattened helix whose axis is the direction of the beam; to an observer looking along the light beam this point appears to describe the perimeter of an ellipse, the degree of such polarization being characterized by the **ellipticity** and by the angular orientation of the major axis of the ellipse. Elliptically polarized light may be considered to result from the superimposition of two linearly polarized waves of equal amplitude and having their electric vectors mutually at right angles but where the phase difference is neither zero nor exactly an even or odd number of quarter-wavelengths; alternatively, it may be considered to result from the superimposition of right and left circularly polarized waves of differing amplitude.

polarizer or **polariser** an optical device for producing linearly polarized light, e.g. a **Nicol prism** or a sheet of **Polaroid** (def. 1).

polarizing microscope or **polarization microscope** a microscope that is useful for examining the birefringence properties of small objects, or for visualizing objects by virtue of their birefringence properties. *Also*: polarising microscope, polarisation microscope.

polar microtubule see **mitotic spindle**, **prometaphase**.

polar molecule a molecule in which there is a polarized distribution of positive and negative charges due to an uneven distribution of electrons. Polar molecules are likely to be soluble in water.

polar mutation a mutation in one gene that reduces the expression of genes further from the promoter in the same operon.

polarogram the current–voltage diagram obtained by **polarography**.

polarograph 1 an instrument used for **polarography**. **2** to subject (a sample) to analysis by polarography.

polarography a method for quantitative or qualitative determination of small concentrations of reducible or oxidizable substances based on the nature of the current–voltage curve obtained when a test solution is subjected to electrolysis with a steadily increasing voltage between, e.g., a dropping mercury cathode and a pool of mercury serving as anode. The current–voltage curve obtained (called a **polarographic wave**) is sigmoidal; the potential at the midpoint (called the **half-wave potential**) is characteristic of the substance being oxidized or reduced and the limiting current is related to its concentration. —**polarographic** *adj.*

Polaroid a *proprietary name* for **1** a thin, transparent material that linearly polarizes light transmitted by it (see **polarized light**). It consists of oriented, doubly refracting microcrystals of herapathite (quinine iodosulfate) in a matrix of cellulose acetate. **2** a photographic process or camera producing a nearly instantaneous, permanent photograph.

polar solvent any solvent of relatively high **ionizing power**.

polar zipper a motif in proteins that is considered to promote binding between protein subunits, or between proteins, as a result of interactions between polar residues, which are aligned in the form of a 'zip fastener'. The polar groups may consist of repeats of glutamines, Asp–Arg or Glu–Arg repeats, or repeats of glutamates and either lysines or histidines. The concept derives from the previously coined term **leucine zipper**.

pole 1 either end of an axis of rotation of a sphere or spheroid body, especially of the Earth. **2** (*in biology*) **a** either of the differentiated zones at opposite ends of an axis in a cell, organ, or organism. **b** (*in mitosis or meiosis*) either of the opposite ends of the **spindle**. **3** (*in physics*) **a** any of the zones in a magnetized body, commonly two in number and near its extremities, where the lines of magnetic flux appear to originate (**north pole**) or end (**south pole**). **b** either of the (positively or negatively charged) terminals of an electric battery, or of the corresponding terminals of a d.c. electric generator; either of two points, positions, or regions carrying opposite electric charges in a piece of material, system, or (polar or polarized) molecular entity. *Compare dipole. See also polar.*

policeman a device used for detaching adherent particles of precipitate, cells, etc. from the wall of a vessel and consisting commonly of a glass stirring-rod with a short piece of rubber tubing fitting tightly over one end, but sometimes of a small snipe feather cemented into the end of a capillary tube.

polio virus a member of the *Picornaviridae* genus *Enterovirus*. which has 60 copies each of four subunits as coat proteins, VP1,2,3,4, produced synthesized as a polyprotein. They are arranged with the symmetry of an icosahedron. The genome is a positive sense RNA. The polymerase used in the replication of the virus is a multisubunit enzyme of four subunits only one of which is virus specific, the other subunits being provided by the host. Two kinds of vaccine have been used, killed virus, Salk, and attenuated live, Sabin. The latter sometimes can revert to the wild strain in the gut.

poly+ *comb. form 1* denoting more than one; many or much; more than the usual number or amount; often used interchangeably with **multi+**. **2** indicating heterogeneity of a physical attribute e.g. polychromatic, polydisperse. *Compare mono+* (def. 2). **3** (*in chemistry and biochemistry*) **a** denoting more than one of a specified component or substituent, e.g. polyamine, polyene, polyester; in names of large molecules, usually denoting more than 10–20 of the component specified, especially in contrast to **oligo+** (def. 2), e.g. polynucleotide, polypeptide, polysaccharide. *Compare mono+* (def. 3). **b** denoting polymer of a specified substance, e.g. polyglycine, polystyrene. **c** indicating more than one function of the kind specified, e.g. polyacidic, polybasic, polydentate, polyhydric. *Compare mono+* (def. 5).

poly(A) *abbr. for polyadenylate.*

polyacidic (of a **base** (def. 1)) able to accept more than one proton per molecule in solution.

polyacrylamide (gel) a common name for any hydrogel containing a 3-D matrix of randomly cross-linked polymers of acrylamide (2-propanamide; CH₂=CH-CO-NH₂). The cross-linking agent commonly used is *N,N'*-methylene bisacrylamide, (CH₂=CH-CO-NH₂)₂CH₂, polymerization being initiated by various alternative methods for generating free radicals. The pore size and rigidity of the gel depend on the concentration of acrylamide, and the proportion of cross-linking agent used.

polyacrylamide gel electrophoresis *abbr.*: PAGE; a technique of **zone electrophoresis** that uses polyacrylamide gel as supporting medium. It is especially useful for the separation of biopolymers and fragments thereof. A two-dimensional electrophoresis has been used to resolve as many as 1000 proteins: in the first step the polypeptides are separated by **isoelectric focusing electrophoresis** and in the second step by **SDS (polyacrylamide) gel electrophoresis**. The 2-D process was devised by P. H. O'Farrell, after whom it is often named.

polyacrylamide gradient gel electrophoresis an alternative name for **gradient gel electrophoresis**.

polyadenylate 1 *abbr.*: poly(A); any homopolymer of adenylate (i.e. adenosine 5'-monophosphate). Most eukaryotic mRNAs are terminated at the 3' end by a tract of poly(A) 80–250 residues long (*see poly(A) tail*). **2** to add a stretch of polyadenylate to a molecule. —**polyadenylation** *n*.

polyadenylation binding protein *see PABP-2.*

polyadenylation element a nucleotide sequence in the 3' untranslated region of eukaryotic mRNA that contains a highly conserved AAUAAA followed by 10–30 nucleotides from where cleavage occurs and poly(A) formation starts. It is recognized by a complex

that contains **cleavage and polyadenylation specificity factor (CPSF)**, **poly(A) polymerase**, and **PABP-2**

poly(ADP-ribose) glycohydrolase *abbr.*: PARG; an enzyme that hydrolyses poly(ADP-ribose) to ADP-ribose units. Highly conserved in mammals, it contains an N-terminal putative regulatory domain, a central nuclear localization signal, and a C-terminal catalytic domain. There are multiple isoforms derived from a single gene.

poly(ADP-ribose) polymerase *see PARP-1; PARP-2.*

poly(ADP-ribosyl) a structure found attached to histones H1 and H2B, to other eukaryotic chromosomal proteins, and to some mitochondrial proteins. It consists of a polymer of 20–50 ADP-D-ribosyl units linked by glycosidic bonds; linkage is formed by transfer of the ADP-ribosyl unit of NAD⁺, linking its ribosyl C-1 position to the C-2' position of the ribosyl of the terminal ADP-ribose of the growing chain. The attachment to protein appears, at least in some instances, to be through an ester linkage between the terminal ribose group and certain free carboxyl groups in the protein. *See also ADP-ribosylation; NAD(P)⁺arginine ADP-ribosyltransferase.*

poly(ADP-ribosyl) transferase EC 2.4.2.30; *recommended name*: NAD⁺ADP-ribosyltransferase; *systematic name*: NAD⁺:poly(adenine-diphosphate-D-ribosyl)-acceptor ADP-D-ribosyl-transferase; *other names*: poly(ADP-ribose) polymerase; poly(adenosine diphosphate ribose) polymerase; ADP-ribosyltransferase (polymerizing); poly(ADP-ribose) synthetase. An enzyme responsible for ADP-ribosylation of acceptors; it catalyses a reaction between NAD⁺ and (ADP-D-ribosyl)_n-acceptor to form nicotinamide and (ADP-D-ribosyl)_{n+1}-acceptor. It often has zinc as cofactor (as in example); the acceptor is a histone, a transcription factor, a DNA repair protein, or the enzyme itself. The modification is dependent on DNA and is involved in the regulation of cellular processes such as differentiation, proliferation, and tumour transformation and also in the regulation of the molecular events involved in the recovery of a cell from DNA damage. Mammals have four homologues (PARP-1, PARP-2, V-PARP, and tankyrase). In *Drosophila*, application of a heat-shock stimulus causes PARP to accumulate and become active at heat-shock genes. Ecdysone also causes accumulation of PARP at chromosome puffs. *See also NAD(P)⁺arginine ADP-ribosyltransferase. Compare ADP-ribosylation.*

polyamide any polymer in which the constitutional units are joined by amide or thioamide links. *Compare nylon, polypeptide.*

polyamine any organic compound containing two or more amino groups. **Putrescine**, **spermine**, and **spermidine** are important animal polyamines. Polyamines are synthesized by various routes. In animals, **putrescine** is the decarboxylation product of **ornithine**. Decarboxylated *S*-adenosylmethionine (*see S-adenosylmethionine decarboxylase*) is a substrate in a reaction in which propylamine is transferred to putrescine, to form spermidine, and again to spermidine to form spermine. *See also ornithine decarboxylase.*

poly(amino acid) any homopolymer, or mixture of homopolymers, of a particular (specified) amino acid.

polyampholyte any amphoteric **polyelectrolyte**.

polyanion any macromolecular ion that carries multiple negative charges.

poly(A) polymerase *abbr.*: PAP; *the recommended name for polynucleotide adenyltransferase.*

poly(A) tail a sequence of adenyl residues at the 3' end of eukaryotic mRNA. Almost all mature eukaryotic mRNAs have 3'-poly(A) tails of 40–250 nucleotides, those of histones being a notable exception. The primary transcript is first cleaved 10–30 nucleotides past a highly conserved AAUAAA sequence, then the poly(A) tail is generated from ATP through the action of **polynucleotide adenyltransferase** and several other proteins. In practical terms the poly(A) tail on mRNA facilitates its ready isolation from total cellular RNA by affinity chromatography on oligo(dT)-cellulose.

polyatomic (of a molecular entity) composed of two or more atoms.

polybasic (of an **acid** (def. 1)) able to give up more than one proton per molecule in solution.

Polybrene a proprietary name for 1,5-dimethyl-1,5-diazaundecamethylene polymethobromide; *other name*: hexadimethrine bromide; a positively charged polymer with coagulant properties. It

causes nonspecific agglutination of red blood cells and has been used in the transfection of eukaryotic cells.

poly(C) *abbr.* for polycytidylate.

polycarbonate any polymer in which the structural units are linked by carbonate ester groups, usually formed by the polymerization of diphenylols with phosgene (i.e. carbonyl chloride). Such polymers are tough thermoplastic resins.

polycation any macromolecular ion that carries multiple positive charges.

polychlorinated biphenyl *abbr.*: PCB; any of various compounds that are based on the biphenyl ring structure and chlorinated at various positions. PCBs were formerly used in industrial and commercial applications such as transformers and hydraulic equipment, and as plasticizers in paints, plastics, and rubber products. They persist in the environment. Manufacture in the USA ceased in 1977.

polychromatic 1 relating to, or possessing, various or varying colours; consisting of, relating to, or emitting light (or other electromagnetic radiation) of two or more frequencies or wavelengths. **2 of**, relating to, or showing **polychromatophilia**.

polychromatophilia the quality of being stainable by more than one type of dye, especially by both acid and basic dyes.

polycistronic messenger RNA or **multicistronic messenger RNA** or **polygenic messenger RNA** any messenger RNA molecule that carries more than one initiation site and encodes the synthesis of two or more (usually related) gene products. It is formed by transcription of a single operon and is characteristic of prokaryotes.

polyclonal of, pertaining to, being formed by, or derived from two or more **clones** (def. 1).

polyclonal antibody an antibody that arises from the immune response to an immunogen. Each **epitope** on the immunogen has the potential for causing the formation of a clone of **B lymphocytes** each capable of synthesizing an antibody specific to the particular epitope.

Polycomb one of a group of proteins in *Drosophila* that regulate the expression patterns of many developmental genes. Polycomb group proteins are involved in chromatin-based gene silencing and enable established patterns of gene expression to be transmitted over multiple rounds of cell division. *Compare* **trithorax**.

Polycomb a family of genes in *Drosophila* that select which homeotic selector genes should not be expressed. They encode homologous regulatory proteins that bind to the chromatin of the genes they control.

polycyclic having more than one ring of atoms in the molecule; used especially of molecules with condensed ring systems.

polycystin either of two proteins produced by different genes for autosomal dominant polycystic kidney disease (PKD). **Polycystin 1** is a membrane-associated glycoprotein (4303 amino acids) involved in cell-extracellular matrix interactions, and expressed in fetal, adult, and polycystic kidney. It consists of an extracellular N-terminal region of ≈ 3000 residues (containing 16 PKD1 repeats), 11 transmembrane helices, and a C-terminal coiled-coil region and sites for phosphorylation of serine/threonine and tyrosine. It shows $\approx 30\%$ homology with polycystin 2. More than 60 mutations result in PKD type 1, which affects infants and is severe. **Polycystin 2** is an integral membrane protein (968 amino acids) that contains six transmembrane helices and intracellular N- and C-termini. The N-terminal region contains a coiled-coil region and an EF hand for Ca^{2+} binding. Polycystin 2 is more closely related to voltage-gated calcium channels than to polycystin 1. It is expressed ubiquitously but especially in fetal kidney and lung. More than 50 mutations cause PKD type 2, which affects adults.

polydentate *an alternative term for* **multidentate**.

polydeoxynucleotide or **polydeoxyribonucleotide** any polynucleotide composed solely of **deoxynucleotide** residues.

polydisperse describing a colloidal system whose disperse phase consists of particles of many different sizes. — **polydispersity** *n*.

polyelectrolyte any macromolecular substance that, on dissolution in water or another ionizing solvent, dissociates to give polyanions or polycations together with an equivalent of oppositely charged ions, which may be simple ions or themselves polyions.

polyene any unsaturated organic compound containing two or more carbon-carbon double bonds.

polyene antibiotic any member of a group of structurally related antibiotics produced by *Streptomyces* spp. They possess a large lactone ring containing 4–7 conjugated double bonds (generally all-*trans*) and substituted by aliphatic groups, by a residue of **mycosamine** or another amino sugar, and by numerous hydroxyl groups. The polyene antibiotics include **amphotericin B** and **nystatin**; they interact with sterols in cell membranes and hence have antifungal but not antibacterial activity and tend to be toxic to mammals. *Compare* **macrolide**.

polyenoic acid any alkenyl carboxylic acid containing two or more double bonds per molecule.

polyester any synthetic polymer in which the constitutional units are joined by ester bonds; proprietary materials include Dacron and Mylar. Polyesters are extensively used in textiles, ropes, etc.

polyethylene *an alternative name (esp. US) for* **polythene**. *See also* **polyethylene glycol**.

polyethylene glycol *abbr.*: PEG; any polymer of general formula $\text{H}(\text{OCH}_2\text{CH}_2)_n\text{OH}$, where $n \geq 4$; a suffixed number may be used as a guide to the average relative molecular mass, e.g. polyethylene glycol 4000. Polyethylene glycols are clear viscous liquids or white solids, useful as embedding media for microscopy, as bases for ointments, and in radioimmunoassays. Treatment of proteins with PEG increases their functional stability and decreases their clearance and immunogenicity when injected in therapy.

poly(ethyleneimine) a water-soluble synthetic linear polymer of ethyleneimine (i.e. aziridine) of 30–40 kDa. It is useful for the selective precipitation of proteins and nucleic acids. It is also used as a substituent in hydroxylated chromatographic support matrices, as in PEI-cellulose, to form anion exchangers. *Proprietary name*: Polymin P.

polyfructosan *former term for* **fructan**.

poly(G) *abbr.* for polyguanylate.

polygalactan *former term for* **galactan**.

polygalacturonase EC 3.2.1.15; *other name*: pectinase; an enzyme that hydrolyses 1,4- α -D-galactosiduronate linkages in pectin and other galacturonans in a random fashion. It participates in cell-wall degradation in plants.

polygene any one of a group of genes, each of which individually exerts a small effect on the phenotype but that together control a quantitative character such as stature.

polygenic describing a character or trait that is controlled by polygenes. **Polygenic diseases** result from the interaction of multiple genes and include common diseases such as diabetes mellitus, coronary heart disease, and hypertension. Some genes can have major effects whereas others might have relatively minor effects. *Compare* **multigenic**.

polyglucosan *a former term for* **glucan**.

polyglutamine or (*sometimes*) **polyglutamine tract** a stretch of amino acids in a protein that is entirely composed of glutamine. Gene sequences giving rise to this structure may have $(\text{CAG})_n$ repeats and can be subject to replication slippage. A consequence is expansion of polyglutamine tracts in succeeding generations eventually causing symptoms of disease. Huntingtin is a well-known example. *See* **Huntington's disease**.

polyglutamine disease any disease of humans caused by the expansion of a CAG trinucleotide repeat in a gene. On expression, the region that contains the elongated stretch of glutamine repeats misfolds and forms antiparallel beta strands, with consequent production of nuclear and cytoplasmic inclusions. Examples include Huntington's disease, spinobulbar muscular atrophy, and various forms of spinocerebellar ataxia.

polygon any closed plane figure bounded by three or more (nonintersecting) straight lines. — **polygonal** *adj*.

polyhedron (*pl.* **polyhedrons** or **polyhedra**) any solid figure bounded by four or more plane faces, each of which is a polygon. — **polyhedral** *adj*.

polyhormone a polypeptide that is a precursor to more than one biologically active peptide; an example is **proopiomelanocortin**.

polyhydric describing any chemical compound containing two or more hydroxyl groups per molecule; used especially of alcohols.

poly(hydroxybutyrate) a linear polymer of approximately 1500 (*R*)-3-hydroxybutyrate residues held together in ester linkage. It is

found in the cells of a number of prokaryotic genera where it occurs in membrane-bound granules and acts as a storage material.

poly(l) *abbr.* for polyinosinate.

polyion any macromolecular ion that carries multiple charges.

polykaryocyte a multinucleate cell. —**polykaryotic** *adj.*

polyketide or (*sometimes*) **acetogenin** any natural product synthesized via linear poly- β -ketones, which are themselves formed by repetitive head-to-tail addition of acetyl (or substituted acetyl) units indirectly derived from acetate (or a substituted acetate) by a mechanism similar to that for fatty-acid biosynthesis but without the intermediate reductive steps. In many cases, acetyl-CoA functions as the starter unit and malonyl-CoA as the extending unit. Various molecules other than acetyl-CoA may be used as starter, often with methylmalonyl-CoA as the extending unit. The poly- β -ketones so formed may undergo modification by alkylation, cyclization, glycosylation, oxidation, or reduction. Polyketides include: coniine (of hemlock) and orsellinate (of lichens) – acetyl-CoA; flavanoids and stilbenes – cinnamoyl-CoA; tetracyclines – amide of malonyl-CoA; urushiols (of poison-ivy) – palmitoleoyl-CoA; erythronolides – propionyl-CoA and methylmalonyl-CoA as extender. Polyketide synthases are large multidomain proteins that contain phosphopantetheine.

polylabelling labelling where more than one atom of a molecule has been isotopically substituted.

polylinker any **linker** containing multiple restriction sites. *See multiple cloning site.*

poly-L-lysine any polypeptide composed entirely of L-lysine. Solutions of poly-L-lysine are used to coat microscope slides to improve the adhesion of tissue sections, or to improve adhesion of oligonucleotides in the preparation of microarrays for gene expression profiling. The attachment and spreading of some mammalian cell types in culture is promoted by coating surfaces with poly-L-lysine.

polymannan a former term for **mannan**.

polymer 1 (*in chemistry and biochemistry*) any substance that is composed of molecules containing a large number of constitutional units (or 'mers') that are in repetitive covalent linkage and that may be of one or more than one species. Polymers are generally considered to comprise at least ten mers, although sometimes the term is taken to imply simply 'more than one' mer. Hence 'polymer' may or may not embrace **oligomer**, depending on the branch of chemistry or biochemistry concerned. **2** (*in molecular biology and enzymology*) (*sometimes*) an alternative term for **multimer**. *See also heteropolymer, homopolymer.* —**polymeric** *adj.*; **polymerize** or **polymerise** *vb.*; **polymerization** or **polymerisation** *n.*

polymerase a general name for any transferase enzyme that catalyses the formation of biological **polymers** (def. 1), especially of polynucleotides. *See DNA polymerase, RNA polymerase.*

polymerase accessory protein any of a group of proteins that are associated with **DNA polymerases**. Examples include DNA polymerase α binding factor from yeast, and phage T4 accessory proteins.

polymerase chain reaction *abbr.*: PCR; a method whereby a specific sequence of nucleotides within a double-stranded DNA is amplified. The sequence is identified by the use of short synthetic oligonucleotide primers that are complementary to the two terminal regions of the DNA sequence to be amplified; these oligonucleotides are extended by the thermostable *Taq* DNA polymerase on the DNA template. The effect is that the new chains span the region delimited by the two chosen termini. There are three phases in a single cycle of a PCR reaction: the nascent chains are heat denatured at 94°C; the temperature is then decreased to allow annealing of the primers to the template strands; and then the temperature is increased to 72°C for extension. The theoretical yield of amplified product is 2^n where n is the number of cycles. More than a 10^9 -fold **amplification** of the DNA stretch required may be obtained. The method was first described by Kary B. Mullis in 1984. The use of the thermostable *Taq* (or other) polymerase from a thermophilic bacterium avoids the need to add more polymerase at each cycle because the enzyme is not inactivated at the temperature of denaturation of the DNA. PCR amplification has become an indispensable tool in a great variety of applications. Clinically it may be used for the rapid diagnosis of infectious diseases and the detection of rare

mutations associated with cancer. Forensically, the DNA from even a single hair or sperm can be used to identify the donor. RNA may be amplified by first converting it to cDNA through the use of reverse transcriptase. *See also hot start PCR, inverse PCR, touchdown PCR, whole genome PCR.*

polymer drug a polymer that contains either chemically bonded drug molecules or pharmacologically active moieties. Polymer drugs are typically used to provide targeted drug delivery to an organ and controlled release of an active drug at the target organ.

polymer functionalization the introduction of chemical groups into a polymer to exert specific chemical, physical, biological, pharmacological, or other functions. *See functional polymer.*

polymetaphosphate (*sometimes*) an alternative name for **polyphosphate**.

poly(methyl methacrylate) a clear, easily worked, relatively non-toxic thermoplastic, useful as a substitute for glass and in the construction of many pieces of scientific apparatus. *Proprietary names:* Lucite, Perspex, Plexiglass, etc.

Polymin P a proprietary name for poly(ethyleneimine).

polymorph *see polymorphonuclear leukocyte.*

polymorphic or **polymorphous** having, assuming, or passing through various different forms or styles; exhibiting or undergoing **polymorphism**.

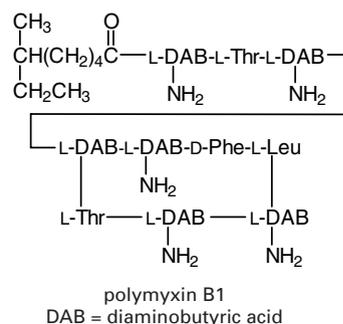

polymorphism 1 (*in biology*) a the occurrence of two or more distinct kinds of individual (**morphs**) belonging to the same species within a population that is interbreeding freely. **b genetic polymorphism. 2** (*in chemistry*) the existence of the same substance in two or more different crystalline forms. *See also enantiomorph.*

polymorphonuclear 1 describing a cell whose nucleus is multipartite or **polymorphic. 2** a **polymorphonuclear leukocyte**.

polymorphonuclear leukocyte or **polymorphonuclear** or **polymorph** *abbr.*: PMN; any white blood cell of the myeloid series that in its mature form has a lobed and variably shaped nucleus and granular cytoplasm; included are basophil leukocyte, eosinophil leukocyte, and neutrophil leukocyte. The term is often used erroneously for neutrophil leukocyte solely.

polymorphous a variant form of **polymorphic**.

polymyxin any of a family of antibiotics isolated from cultures of *Bacillus polymyxa* and active against most Gram-negative bacteria. Individual polymyxins are designated by suffixed letters, e.g. polymyxin B. All are decapeptides containing five or six residues of L-2,4-diaminobutyric acid. Their biosynthesis does not involve ribosomes (*see protein and peptide biosynthesis*). The sequence of seven residues at the C-terminal end is formed into a heterodetic ring through an isopeptide link to one of the diaminobutyric acid residues, while the N-terminal residue is acylated with a 6-methylheptanoyl or 6-methyloctanoyl group. Polymyxins bind to the plasma membrane of sensitive organisms, causing leakage of cytoplasmic components; however, they also attack the cell membranes of eukaryotic cells and therefore have limited clinical usefulness; they are used in antibiotic ointments. Polymyxin B inhibits protein kinase C. *See also colistin.*

polynucleate or **polynuclear** (of a cell) containing several or many nuclei; **multinucleate**.

polynucleotidase an alternative name for **polynucleotide phosphatase**.

polynucleotide any one-stranded homo- or heteropolymer of at least about ten **nucleotide units** connected by phosphodiester linkages between (usually) the 3' position on the glycoside moiety of one nucleotide unit and the 5' position on the glycoside moiety of the adjacent one, or any two-stranded molecule comprised of two such one-stranded molecules held together by hydrogen bonds. Comprehends the term **nucleic acid**.

polynucleotide adenyltransferase EC 2.7.7.19; *other names*: NTP polymerase; RNA adenylating enzyme; poly(A) polymerase (*abbr.*: PAP); an enzyme that adds the **poly(A) tail** to mRNA. It catalyses a reaction of the type:

PAP I and II contain an RNA-binding domain, a catalytic region, two nuclear localization signals, and a C-terminal serine/threonine-rich region. Clones of truncated forms have been obtained, some of which are expressed in tissues. The enzyme from *Escherichia coli* is also known as **plasmid copy number protein**. *See also polyadenylate*.

polynucleotide kinase *abbr.*: PNK; any enzyme belonging to subclass EC.2.7 that phosphorylates the 5' end of nucleic acids. The reaction is between ATP and the 5'-OH of RNA or DNA to form ADP and RNA or DNA-5'-phosphate.

polynucleotide ligase an alternative name for DNA ligase (ATP); *see DNA ligase*.

polynucleotide ligase (NAD⁺) an alternative name for DNA ligase (NAD⁺); *see DNA ligase*.

polynucleotide phosphatase or **polynucleotidase** either of the enzymes polynucleotide 3'-phosphatase (EC 3.1.3.32) or polynucleotide 5'-phosphatase (EC 3.1.3.33).

polynucleotide phosphorylase an alternative name for polyribonucleotide nucleotidyltransferase (EC 2.7.7.8).

polyol any polyhydric alcohol.

polyol pathway (*sometimes*) a metabolic pathway by which non-phosphorylated sugars and sugar alcohols are interconverted.

polyomavirus any member of a genus (*Polyomavirus*) of mouse viruses of the Papovaviridae family. They are widely distributed and may be oncogenic under appropriate conditions.

polyose an obsolete term for any polymer consisting of an unknown or unspecified number of covalently linked monose residues.

polypeptide **1** any peptide comprising more than about 10–20 amino-acid residues connected by peptide linkages. Unlike a **protein**, it usually lacks appreciable tertiary structure in solution and is not liable to irreversible denaturation. **2** (*loosely*) an alternative term for **protein**. **3** describing another entity of a polypeptide nature, e.g. polypeptide chain, polypeptide hormone.

polypeptide hormone an alternative term for **peptide hormone**.

polyphase or **polyphasic** **1** (of matter) consisting of two or more phases. **2** or **multiphase** (of an electrical system or device) having, generating, or using two or more alternating electric voltages of the same frequency but differing from each other in phase. **3** (of a process) consisting of or occurring in a number of separate stages.

polyphenol oxidase EC 1.10.3.1; *recommended name* catechol oxidase; any copper-containing oxidoreductase that catalyses the oxidation of mono and *o*-diphenols to *o*-diquinones. These enzymes are found in plants, localized in membranes of plastids, but their function is unknown. However, they are responsible for brown discoloration ('browning') in fruit and vegetables on storage, as their products give rise, probably nonenzymatically, to polyphenolic melanin-like compounds. Their gene sequences in different plants are very similar, but in relation to bacterial, fungal, or animal enzymes (*see monophenol monooxygenase*) only the putative copper-binding sites are conserved.

polyphosphate or (*sometimes*) **polymetaphosphate** **1** any ionic form of polyphosphoric acid, H_{n+2}P_nO_{3n+1} (where *n* is an unknown or unspecified integer greater than 1), or any mixture of polyphosphoric acid and its ionized forms. Polyphosphate occurs in the **volutin granules** observed in many microorganisms, where it is synthesized by the action of the enzyme **polyphosphate kinase** and is

believed to serve as a phosphate store. **2** any (partial or full) salt or ester of polyphosphoric acid. *See also metaphosphate*.

polyphosphate kinase EC 2.7.4.1; a microbial enzyme that catalyses the synthesis of **polyphosphate** by transfer of the terminal phosphoric residue of ATP to diphosphate (i.e. pyrophosphate) or to a polyphosphate one residue smaller than the product.

polyphosphoinositide or **polyphosphatidylinositide** a former inappropriate general name for any [mono]phosphate, bisphosphate, triphosphate, or tetrakisphosphate of phosphatidylinositol; use not recommended.

polyploid describing a cell (or organism) that has three, four, five, or more times the haploid number of chromosomes in its nucleus. —**polyploidy** *n*.

polyprenol a recommended term for any **prenol** in which there are more than four isoprene residues; the isoprene units may be all-*trans* or a mixture of *cis* and *trans*. The number of such units in a particular polyprenol may be indicated by a multiplicative prefix, e.g. undecaprenol. Polyprenols and their derivatives are widely distributed in living organisms. *See also dolichol*.

polyprenyl the univalent alkyl group derived from a **polyprenol** by loss of its hydroxyl group. The number of isoprene residues in a particular polyprenyl derivative may be indicated by a multiplicative prefix, e.g. undecaprenyl diphosphate.

polyprotein any polypeptide that, on cleavage, gives rise to two or more biologically active proteins, e.g. **proopiomelanocortin**.

polyQ an alternative term for **glutamine repeat**.

polyribonucleotide any polynucleotide composed solely of ribonucleotide residues.

polyribonucleotide nucleotidyltransferase EC 2.7.7.8; *other name*: polynucleotide phosphorylase. An enzyme that degrades mRNA, phosphorylating single nucleotides successively from the 3' end to yield a nucleoside diphosphate and a shortened mRNA.

polyribonucleotide synthase (ATP) *see RNA ligase (ATP)*.

polyribosome an alternative name for **polysome**.

polysaccharide an alternative name for **glycan**; i.e. any linear or branched polymer consisting of monosaccharide residues. Important polysaccharides include glycogen, starch, hyaluronic acid, and cellulose.

poly- α 2,8-sialic acid a linear homopolymer (*n* \approx 100) of α 2,8-linked sialic acid molecules present mainly on **neural cell adhesion molecules** (NCAMs). Its biosynthesis is mediated by polysialyl transferase, which uses CMP-sialic acid as substrate. It is abundant in fetal brain during development, and in adult brain in areas of synaptic plasticity, and is a marker for several tumours.

polysome or **ergosome** or **polyribosome** any structure consisting of two or more ribosomes attached to different points on the same strand of messenger RNA. Hence, a polysome is a complex involved in the cellular synthesis of the polypeptide specified in the message. Polysomes effect the synthesis of all proteins, but in the case of secretory proteins they become attached to the **rough endoplasmic reticulum**.

polysomic **1** describing a cell or organism that has one or more normal chromosomes in excess of the usual diploid or polyploid complement; being such a chromosome. **2** a polysomic organism. —**polysomy** *n*.

polystyrene phenylethene homopolymer; a clear, brittle, rigid thermoplastic with high electrical resistivity. A proportion of divinylbenzene may be added as a cross-linking agent during polymerization in order to produce polystyrene resins of various porosities for use in the preparation of polystyrene ion-exchange resins.

polysubstituted having more than one chemical substituent. —**polysubstitution** *n*.

poly(T) *abbr.* for polythymidylate.

polytene chromosome a type of chromosome in a **polyploid** cell, formed when multiple copies of homologous chromosomes are aligned side by side to give a giant chromosome in which distinct chromosome bands are readily visible.

polyteny an alternative name for **endomitosis**. —**polytene** *adj.*

polytetrafluoroethylene *abbr.*: PTFE; tetrafluoroethene homopolymer; a polymer consisting of chains of (\approx 2000) linked $-\text{CF}_2-$ units prepared by polymerization of tetrafluoroethylene, $\text{F}_2\text{C}=\text{CF}_2$. It is a nonflammable thermoplastic, extremely chemically resistant,

of high electrical resistivity, and with an extremely low coefficient of friction. It is useful as tubing and sheeting in chemical laboratory work, as a lining to reaction vessels, as gasket material, and as packing for pumps and bearings. *Proprietary names:* Fluon, Teflon, etc.

polythene or (*esp. US*) **polyethylene** ethene homopolymer; a versatile thermoplastic polymer of ≈ 1.5 –100 kDa, prepared by polymerization of ethylene. **High-density polyethylene**, a linear polymer, is fairly rigid and crystalline, while **low-density polyethylene**, a branched polymer, is softer and more flexible; both forms are chemically resistant and have high electrical resistivity.

polytopic describing an integral membrane protein that completely traverses the membrane two or more times.

polytrioxophosphate(v) *the recommended name for metaphosphate.* **poly(U)** *abbr. for polyuridylyate.*

polyUb *abbr. for polyubiquitin. See multiubiquitin.*

polyubiquitin 1 the form in which **ubiquitin** (def. 1) is synthesized, a precursor with a number of head-to-tail repeats. **2** *an alternative name for multiubiquitin.*

polyUb recognition factor a protein subunit of the 19S proteasome that binds multiubiquitin (polyubiquitin) chains tightly. When tested individually only one subunit (called S5a) qualified for the role.

polyunsaturated describing a substance containing more than one carbon-carbon multiple bond per molecular entity or residue; applied especially to a fatty acid containing more than one multiple bond in the hydrocarbon chain of its molecular structure, and to a fat or oil derived from one or more such fatty acids. *See also polyunsaturated fatty acid.* —**polyunsaturation** *n.*

polyunsaturated fatty acid *abbr.:* PUFA; any fatty acid that is **polyunsaturated**; the multiple bonds are most frequently all ethylenic and usually methylene-interrupted, the configuration of their substituents generally being *Z* (i.e. *cis*); more rarely is an acetylenic bond present. In animal metabolism, polyunsaturated fatty acids belong to families denoted by the position of the double bond nearest to the methyl group and often also by the name of the fatty acid from which the remainder can be derived; hence **linoleic family**, **linolenic family**, **oleic family**, and **palmitoleic family**. In recent years, emphasis has been placed on a role of some polyunsaturated fatty acids in lowering plasma cholesterol, and potentially reducing the risk of heart disease. Foremost among these have been those of the *n*-6 family such as linoleic acid. A recommendation has been made that the diet should contain these polyunsaturated fats in a ratio of 2:1 to saturated fats. *See also essential fatty acid, fatty-acid nomenclature, fish oil.*

polyuria the passing of large volumes of urine.

polyuronide *an old term for glycuronan.*

polyvalent or **multivalent 1** (*in chemistry*) a having a numerical valency greater than unity. **2** (*in immunology*) **a** (of an antibody molecule or fragment) having at least two combining sites. **b** (of an antiserum or other antibody preparation) capable of combining with two or more different antigens. **c** (of a vaccine) capable of eliciting immunity to more than one (strain of) microorganism, toxin, or other antigenic agent.

polyvinyl acetate *abbr.* PVA; ethenoic acid homopolymer; a synthetic polymer obtained from ethyne and acetic acid, used in adhesives and paints and in the manufacture of polyvinyl alcohol.

polyvinyl alcohol *abbr.:* PVA; ethenol homopolymer; a polymer prepared from polyvinyl acetates by replacement of the acetate groups by hydroxyl groups; the commercial products have differing contents of residual acetyl groups and hence differing physical characteristics. Polyvinyl alcohols are used in adhesives and can also be compounded into elastomers, which are useful in the manufacture of artificial sponges, hydrocarbon-resistant tubing, etc.

polyvinyl chloride *abbr.:* PVC; chloroethene homopolymer; a plastic solid, soluble in many organic solvents, that discolours on exposure to light or heat unless containing stabilizers. It is useful for the manufacture of rubber substitutes and electric wire coverings.

polyvinylidene fluoride *abbr.:* PVDF; a synthetic polymer, $(\text{CH}_2-\text{CF}_2)_n$; membranes made of PVDF are used to bind proteins

in Western blotting, protein sequencing, peptide mapping, and in analysis of amino acid composition.

polyvinyl pyrrolidone *abbr.:* PVP; 1-ethenyl-2-pyrrolidone homopolymer; commercial preparations are ≈ 10 kDa to ≈ 700 kDa; it is soluble in water to give colloidal solutions. PVP is used in the preparation of enzymes from plants; it removes phenolic compounds that can destroy enzyme activity.

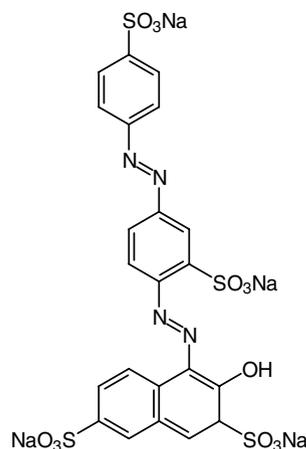

polyxenic *see synxenic.*

pomace the pulpy residue remaining after extraction of juice from fruits such as apples, or after extraction of oil from seeds, nuts, or similar materials.

POMC *abbr. for proopiomelanocortin.*

Pompe's disease *an alternative name for type II glycogen (storage) disease; see glycogen disease.*

Ponceau S or **Fast Ponceau 2B** a dye used for staining protein, especially on cellulose acetate strips.

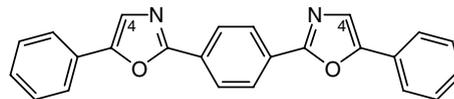

pontal (of an atom or group) bridging.

ponticulin an F-actin-binding transmembrane glycoprotein of plasma membranes of the cellular slime mould *Dictyostelium discoideum*. It is a major membrane protein of this organism, and a protein of the major high-affinity actin-membrane link. It is directly involved in actin polymerization.

pool *see metabolic pool.*

POPOP 1,4-bis(5-phenyloxazol-2-yl)benzene; a secondary fluor used in liquid scintillation counting, originally as a wavelength shifter and more recently to decrease sensitivity to the action of quenching agents.

population 1 (*in biology*) any group of individual organisms of the same species inhabiting a given area; the number of such individual organisms. **2** (*in statistics*) or **universe** any finite or infinite collection of individuals or items from which a sample has been drawn.

population genetics the study of the distribution of genes (alleles) in populations and the factors that change the frequency of genes and genotypes from generation to generation. It is based on the concept of the **Hardy-Weinberg law**.

population standard deviation *see standard deviation.*

P:O ratio *abbr. for phosphorus:oxygen ratio.*

porcine *abbr. (in compound abbrs.) p or (formerly) P;* of, characteristic of, or relating to a pig or pigs; resembling a pig.

porcupine a segment-polarity gene of *Drosophila* that encodes a member of the membrane-bound *O*-acyltransferase superfamily and is involved in Wingless signalling. The protein appears to be localized in endoplasmic reticulum.

pore an opening in a membrane that allows nonselective diffusional passage of small solutes across the membrane. In addition to pores formed spontaneously by thermal and electrical movement of lipid molecules there are the effects of extraneous (frequently toxic) substances that form pores.

pore-forming toxins subclass of transport proteins of the TC system, designated 1.C. It contains nearly 60 families, including **colicins**, **δ -endotoxins**, **α -hemolysins**, **aerolysins**, diphtheria, tetanus and botulinum toxins, **cytohemolysins**, **magainins**, **cecropin**, **melittin**, **defensins**, **nisins**, **mastoparans**, **pilosulins**, and **dermaseptins**. They are produced by bacterial, animal, and plant cells and make irreversible openings or lesions in the membranes of other cells.

porin 1 any member of a class of similar proteins of ~15 kDa (monomer) that can be isolated from the outer membranes of certain Gram-negative bacteria. Trimers of these proteins are thought to make these membranes porous to hydrophilic substances of ≤ 600 Da by forming in them water-filled channels that allow transmembrane diffusion of uncharged small solutes. The proteins are usually homotrimers, typically with β -barrel folds and including short α -helical domains. **2** any of the transmembrane proteins typically of the mitochondrial outer membrane in eukaryotes that form aqueous channels through the lipid bilayer, allowing passage of small molecules. These constitute a structural family, with high β structure content. Human mitochondrial membrane porin (voltage-dependent anion-selective channel protein) allows diffusion of small hydrophilic molecules; the channel adopts an open conformation at low or zero membrane potential, and a closed conformation at potentials above 30–40 mV.

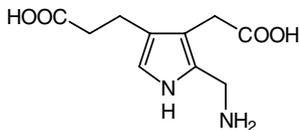

porosity 1 the state or quality of being **porous**. **2** the degree to which a material or substance is porous.

porosome nuclear pore complex.

porous having pores; allowing the passage or uptake of gases and/or liquids, especially by diffusion rather than by bulk flow.

porphin or **porphine** an alternative name for **porphyrin** (def. 1).

porphobilinogen *abbr.*: PBG; 5-(aminomethyl)-4-(carboxymethyl)-1*H*-pyrrole-3-propanoic acid; the biosynthetic precursor of all porphyrins. It is excreted in relatively large amounts in the urine in some porphyrias.

porphobilinogen deaminase *see* **hydroxymethylbilane synthase**.

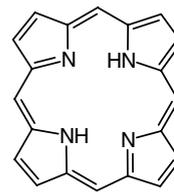

porphobilinogen synthase EC 4.2.1.24; *systematic name*: 5-aminolevulinic acid hydro-lyase (adding 5-aminolevulinic acid and cyclizing); *other names*: δ -aminolevulinic acid dehydratase (*abbr.*: ALAD); aminolevulinic acid dehydratase. An enzyme that catalyses the conversion of two moles of 5-aminolevulinic acid to one mole of porphobilinogen + 2 H₂O in the pathway for the synthesis of **porphyrins**. It is an abundant cytosolic homooctamer in mammalian cells. Each subunit contains a sulfhydryl group and a Zn atom. The crystal structure of the yeast enzyme consists of a TIM barrel. ALAD is identical with the 24 kDa proteasome inhibitor. Enzyme deficiency leads to a rare form of neurovisceral porphyria.

porphyro+ a variant form of **porphyro+** (before a vowel).

porphyria any metabolic disorder characterized by the excretion of abnormally large amounts of various porphyrins and/or their biosynthetic precursors. Porphyrias are currently classified as primary (if inherited) or secondary (if acquired). The primary disorders fall into two broad categories: (a) the neurological/psychiatric forms and (b) the forms associated with cutaneous photosensitivity, though these two types of symptoms may in some cases overlap. The acquired disorders are much more common. There is no clear-

cut association of enzyme defects with specific porphyrias. Elevated blood levels of intermediates in porphyrin biosynthesis are normally present during attacks. Elevated intermediates that are found, together with (in parentheses) associated enzymes and conditions are (1) aminolevulinic acid (or ALA) (porphobilinogen (PBG) synthase: PBG synthase deficiency porphyria; *also called*: ALA dehydratase: ALA dehydratase deficiency); (2) ALA and PBG (PBG deaminase; acute intermittent porphyria, variegate porphyria); (3) uroporphyrin (uroporphyrinogen decarboxylase; porphyria cutanea tarda, acute intermittent porphyria) (4) coproporphyrin (coproporphyrinogen oxidase; variegate porphyria, hereditary coproporphyrin). Acquired porphyria may be due to lead exposure, some malignancies, and chronic ethanol exposure. It has been suggested that the British king, George III, suffered from a form of porphyria leading to psychiatric symptoms. *See erythropoietic porphyria*.

porphyrin 1 the *systematic name* for the fundamental skeleton, C₂₀H₁₄N₄, of the macrocyclic **tetrapyrroles**; *often known also as porphin* or **porphine**. It consists of a ring of four pyrrole nuclei linked each to the next at their α positions (i.e. those adjacent to their nitrogen atoms) through a methine group, -CH= (*compare corrin*). The structure is aromatic and tautomeric, two hydrogen atoms being associated with any two of its four nitrogen atoms (though for the purposes of nomenclature the name 'porphyrin' implies that the saturated nitrogen atoms are at positions 21 and 23 in the molecule unless there is a specific indication otherwise). Many di- or trivalent metal ions are chelated by porphyrin through these four central nitrogen atoms. [*Note*: It was recommended in 1986 that the widely used Fischer system of (incomplete) numeration for the porphyrin ring be discontinued in favour of one in which all the atoms are numbered, the C atoms 1 to 20 and the N atoms 21 to 24.] The systems for numbering tetrapyrrole carbons are shown at **bacteriochlorophyll**. Porphyrin itself is a synthetic substance, deep purple in colour. **2** any member of a large group of naturally occurring or synthetic derivatives or analogues of porphyrin (def. 1), of which **protoporphyrin IX** and its derivatives, especially the chlorophylls and hemes, are the most important.

porphyrinogen 1 5,10,15,20,22,24-hexahydroporphyrin; *see porphyrin 2* a general name for the corresponding hexahydro derivative of any **porphyrin** (def. 2).

porphyria the excretion of abnormally large amounts of porphyrins in the urine. *See also porphyria*.

porphyro+ or (before a vowel) **porphyro+** *comb. form* denoting purple.

porphyropsin a purple, light-sensitive, visual pigment in the rod cells of the retinas of freshwater and migratory fishes, and some amphibians, consisting of a rod-type **opsin** combined (as a Schiff's base) with 3,4-didehydro-11-*cis*-retinal. It has an absorption maximum at ~522 nm, and is analogous in function to **rhodopsin** in other vertebrates.

portable (*in molecular biology*) describing DNA sequences that can be inserted into recombinant molecules for the purposes of gene expression; e.g. portable promoter, portable Shine-Dalgarno sequence, etc.

portal 1 relating to a blood vessel, or system of blood vessels, that carries blood from one capillary bed to another, especially the hepatic portal vein. **2** relating to a porta, such as the hepatic porta (porta hepatis). **3** the route of entry into the body of a drug, micro-organism, beam of radiation, etc. (or sometimes of its exit therefrom).

porter any transporter of solutes between aqueous phases on either side of a lipid membrane. The term includes **antiporter**, **symporter**, and **uniporter** (see **uniport**).

positional cloning a strategy for the identification of a gene of unknown function responsible for a genetic disease. The phenotype is correlated with a chromosomal site, the DNA of that region is cloned and compared with that in normal individuals. If a single gene is involved, it is sequenced, and the protein structure deduced. An example is the discovery of the genetic basis of cystic fibrosis and the identification of the **cystic fibrosis transmembrane conductance regulator** (CFTR).

positional information information supplied to or possessed by cells according to their position in a multicellular organism.

positional isomer any of two or more constitutional isomers that differ in the position of a particular substituent or group.

position-specific iterated-BLAST *abbr.*: PSI-BLAST; see **database-search program**.

position-specific scoring matrix *abbr.*: PSSM; (*in sequence analysis*) a position-specific scoring table that encapsulates the residue information within sets of aligned sequences. The scores may be simply the observed residue frequencies, or they may be the log-odds scores for finding a particular amino acid in a target sequence at a particular position.

positive 1 having a value greater than zero. **2** (*in mathematics*) of the same value but of opposite sense to that regarded as negative. **3** (of the results of a test) indicating the presence of the material or condition tested for. **4** (of an electric charge) having the opposite polarity to the charge of an electron. **5** (of a molecular entity) having a positive electric charge; having a deficiency of electrons. **6** (of a point in an electric circuit) having a higher potential than some other point to which a potential of zero is assigned. **7** (*in biology*) signifying growth or movement towards a (specified) stimulus. **8** (*in photography*) an exposed and developed photographic film, plate, or print showing an image in colours or tones corresponding to those of the object photographed. *Compare* **negative**. —**positiveness** *n.*; **positivity** *n.*

positive chromatography (*sometimes*) any method of purification of substances by affinity chromatography in which a substance of interest in a sample interacts with and is selectively retained by the adsorbent, especially as opposed to **negative chromatography**.

positive control the initiation or enhancement of some biological activity by the presence of a specific molecular entity.

positive cooperativity cooperative ligand binding in which binding of one ligand to one site on a macromolecule increases the affinity at other sites for the subsequent binding of the same or ligands.

positive correlation see **correlation** (def. 2).

positive Darwinian selection the relatively rare phenomenon whereby selective pressure favours change. A commonly used statistical test for positive Darwinian selection is comparison of the rate of synonymous with nonsynonymous substitutions: where nonsynonymous substitutions occur more frequently than synonymous substitutions, this is evidence that natural selection has favoured amino acid change.

positive effector see **effector**.

positive electron *an alternative name for positron*.

positive feedback see **feedback** (def. 1).

positive-negative selection a strategy used in making gene knockouts designed to enrich for homologous recombinants and select against random integration of the targeting vector. Cells transfected with the targeting vector incorporating two **selectable markers** are first selected for their resistance to an antibiotic such as G418 (positive selection) and then for the loss of a second marker, such as HSV thymidine kinase (HSV tk), which confers sensitivity to ganciclovir (negative selection). HSV tk placed at one end of the linear targeting vector is lost on homologous recombination but is retained on random integration.

positive staining a technique used for preparing specimens for electron microscopic examination in which charged biological macromolecules or structures are rendered electron-dense by allowing heavy-metal ions of opposite charge to bind to them. *Compare* **negative-contrast technique**.

positron or **positive electron** *symbol*: β^+ ; an elementary particle that

is the antiparticle of the electron. It has the same mass as an electron and a numerically equal but positive electric charge.

positron emission tomography see **tomography**.

post+ or (*sometimes*) **post-** *prefix* denoting after in time or sequence; behind, posterior to.

postabsorptive describing the period immediately after absorption of food.

posterior after in position, sequence, or time; behind; following.

posterior lobe the posterior lobe of the pituitary gland; i.e. the **neurohypophysis**.

postgreSQL see **relational database management system**.

postlysosome a degenerate **teliosome** that has lost its enzymes.

postmitochondrial fraction or **postmitochondrial supernatant** or **supernatant fraction** *an operational term for* the part of a homogenate of eukaryotic cells or tissue remaining after sedimentation of the mitochondrial fraction by centrifugation. It consists essentially of the **microsomal fraction** and the cytosol.

post-mortem 1 occurring after death. **2** a post-mortem examination; necropsy, or **autopsy**.

postnatal describing the period after birth or giving birth.

postpartum describing the period immediately after birth or giving birth.

postprandial describing the period immediately after intake of food.

postreplication repair see **recombinational repair**, **mismatch repair**.

postreplicative describing the period following replication of a cell or of a nucleic-acid molecule.

postribosomal fraction or **postribosomal supernatant** or **supernatant fraction** *an operational term for* the part of a homogenate of eukaryotic cells or tissue remaining after sedimentation of the ribosomal (microsomal) fraction by centrifugation. It consists essentially of the cytosol.

postsynaptic 1 describing a neuron or a neuronal membrane that is on the efferent side of a synapse. **2** describing the membrane of a muscle cell at a motor end-plate.

postsynaptic density *abbr.*: PDS; a structure, visible on microscopy, that is associated with a postsynaptic membrane. It consists of a variety of scaffolding proteins and signalling enzymes, such as neuronal nitric oxide synthase, Src, Ca²⁺-calmodulin-dependent protein kinase, and calcineurin. The protein PDS-95 also couples NMDA receptors to some of these enzymes.

postsynaptic membrane see **synapse**.

post-transcriptional describing any phenomenon or process occurring after completion of transcription of genomic nucleic acid. —**post-transcriptionally adv.**

post-transcriptional gene silencing *an alternative term for* **RNA silencing**.

post-translational describing any phenomenon or process occurring after completion of translation of messenger RNA into polypeptide; postsynthetic. —**post-translationally adv.**

post-translational modification or **post-translational processing** *abbr.* PTM; any enzyme-catalysed change to a protein made after it is synthesized by the translation of messenger RNA. Examples are proteolytic cleavage and C-terminal peptide amidation. **glycosylation**, **methylation**, **phosphorylation**, and **prenylation**.

Pot-1 *abbr. for* protection of telomeres-1; a protein, widely distributed in eukaryotes, that binds to the G-rich DNA of telomeres.

potash 1 *the common name for* potassium hydroxide or potassium carbonate. **2** *the name for* potassium in the common names of certain of its salts.

potassium or (*in scientific and medical Latin*) **kalium** *symbol*: K; a soft, silvery white, highly reactive, metallic element of group 1 of the (IUPAC) **periodic table**; atomic number 19; relative atomic mass 39.0983. Natural potassium is a mixture of stable nuclides of mass numbers 39 (93.2 atom percent) and 41 (6.7 atom percent) together with a minute proportion of the radionuclide of mass number 40 (0.012 atom percent). Potassium is widely distributed in all living organisms, besides occurring in various minerals; it is one of the most abundant elements of the Earth's crust. It forms a monovalent cation, K⁺. Several artificial radioactive isotopes are known. In the body, potassium is a major intracellular cation, with little in the extracellular compartment; the range in normal human plasma is

3.6–5.0 mmol L⁻¹, with serum 0.2–0.3 mmol L⁻¹ higher due to release from platelets on clotting. The cellular uptake of potassium is stimulated by insulin, and its excretion by the kidney is indirectly controlled by aldosterone, which stimulates sodium reabsorption in the distal tubules, potassium being excreted by passive transfer due to the electrochemical gradient thereby created. It is actively pumped into cells by **sodium/potassium-ATPase**. See also **hyperkalemia**, **hypokalemia**.

potassium-40 the naturally occurring radioactive nuclide $^{40}_{19}\text{K}$. It has a half-life of 1.28×10^9 years, emitting beta particles (i.e. electrons) of 1.34 MeV max. and gamma radiation of 1.46 MeV.

potassium-42 the artificial radioactive nuclide $^{42}_{19}\text{K}$. It has a half-life of 12.36 h, emitting high-energy beta particles (i.e. electrons) of 3.52 MeV max. (82%) and 1.97 MeV max. (18%), together with gamma radiation of 1.52 MeV (18%) and 0.31 MeV (0.15%).

potassium channel or **K⁺ channel** any type of structure that permits controlled (gated) passage of potassium ions, predominantly efflux, through membranes. In excitable cells the role of potassium channels is to set the resting potential, participate in restoring it after depolarization, and attenuate and regulate potentials generated by other excitatory inputs. They are classified into: (1) those primarily responding to membrane polarization, termed voltage-dependent, voltage-gated, or delayed rectifier (see **rectification**) K⁺ channels; transmembrane (typically six transmembrane domains, designated S1 to S6) proteins; (2) Ca²⁺-activated K⁺ channels, which are activated by increase of intracellular Ca²⁺ concentration; (3) receptor-coupled channels, which may be activated or inhibited by receptor occupancy; these may have an intrinsic ion channel as part of the receptor, or act through a G-protein that activates an independent channel; and (4) ATP-sensitive K⁺ channels that close in response to increased intracellular ATP/ADP ratios generated by increased metabolic flux. Types 3 and 4 are known as inward rectifier channels, in that they favour inward movement of K⁺. Such channels have two transmembrane domains rather than the six of voltage-gated channels. However, all K⁺ channels have a loop known as the H5 or P region, which is thought to line the conducting pore. In voltage-gated channels, this lies between segments S5 and S6, and in inward rectifier channels between the two transmembrane domains.

potency (*in pharmacology*) an expression of the activity of a drug or other agent, in terms of either the concentration or the amount needed to produce a defined effect. It is an imprecise term that should always be further defined. Compare **EC₅₀**, **IC₅₀**.

potential (*in physics*) **1** the work done in bringing unit positive charge, unit positive pole, or unit mass from infinity to a specified point in an electric, magnetic, or gravitational field, respectively. **2** **electric potential**. **3** **electric potential difference**.

potential difference *abbr.*: p.d.; **1** generally, the difference in **potential** (def. 1) between any two points. **2** see **electric potential difference**.

potential divider a chain of resistors (or inductors or capacitors) connected in series, across which an electric potential may be applied and from which a desired fraction of the potential may then be obtained from a contact suitably placed in the chain. See also **potentiometer** (def. 3).

potential energy *abbr.*: PE; *symbol*: E_p or V or Φ; the energy of a body or system consequent upon its physical state or its position in an electric, magnetic, or gravitational field. It is expressed as the work necessary to bring it to its present state or position from a reference state or position, to which a potential energy value of zero is assigned.

potential energy barrier or **energy barrier** **1** the difference between the bond energy at which a molecule dissociates and the energy of that molecule in the ground state. **2** the difference between the energy of the ground state of an enzymically activated reaction complex and the sum of the energies of the ground states of the reactants forming the activated complex.

potential gradient **1** the potential difference per unit distance between a point of higher and one of lower (electric) potential; the algebraic differential of this at a particular point. **2** (in cell biology) the difference in chemical and/or electrostatic potential across a membrane.

potentiate to cause to be (more) potent, especially to increase the potency of a drug or other agent. —**potentiation** *n*.

potentiometer **1** a precision instrument for measuring an electric potential difference of constant polarity without drawing current from the circuit being examined. In its simplest form, it consists of a length of wire of uniform resistance and across which a constant potential is applied. By means of a sliding contact the proportion of this applied potential is found that will balance the potential being measured as determined by a null reading on a galvanometer. **2** a direct-reading electronic device for measuring electric potential difference or electromotive force without drawing appreciable current. **3** or (*informal*) **pot** a development of a potential divider consisting of a resistor with a movable contact and used, especially in electronics, either as a potential divider or as a variable resistor. —**potentiometry** *n*.; **potentiometric** *adj.*; **potentiometrically** *adv.*

potentiometric titration or (*sometimes*) **electrometric titration** titration in which an electrode reversible to one of the ionic components of the analyte or titrant is immersed in the analyte solution and the electric potential of the electrode (relative to that of an inert reference electrode) is measured during addition of titrant. Because the potential of an electrode is a logarithmic function of the activity of the ion to which the electrode is reversible, an abrupt change in its potential is observable as an equivalence point is approached.

potocytosis a mechanism for small molecule transport across eukaryotic cell membranes that uses **caveolae** rather than clathrin-coated pits.

Potter-Elvehjem homogenizer a device for preparing small quantities of cell or tissue homogenates. It consists of a cylindrical pestle (of glass, Perspex, or Teflon) that fits closely into a hard-glass test tube. Cells or small pieces of tissue in a suspending medium are placed in the tube and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted to the contents of the tube. [After van Rensselaer Potter (1911–2001), US biochemist, and Conrad Arnold Elvehjem (1901–62).]

POU domain a bipartite DNA-binding domain composed of a POU-specific domain (POU_s, ≈75 amino acids) and a POU-homeo-domain (POU_h, 60 amino acids) that are highly conserved, are joined by a hypervariable linker sequence, and form helix-turn-helix structural motifs. It occurs in many **transcription factors**, and was first recognized in three families of transcriptional regulators, Pit (see **PIT**), **Oct**, and **Unc** (see, e.g., **unc-86**). POU domain genes include the **Brn** family and others. The recognition sequences are A/T-rich, including the highly conserved **octamer** sequence 5'-ATG-CAAAT-3'. The domain is also involved in protein-protein binding. Mutations in two POU-domain proteins (POU3F4 and POU4F3) result in isolated deafness.

pound *symbol*: lb; the avoirdupois unit of mass, now defined as 0.453592338 kg exactly.

powder pattern or **powder diagram** a diffraction pattern obtained from a specimen of a crystalline material in finely divided form. The specimen is rotated in a parallel beam of monochromatic X-rays, electrons, neutrons, etc. so that all planes of the crystals assume all possible orientations with respect to the incident beam.

power **1** *symbol*: P; a measure of the rate of doing work, expressed as energy divided by time. The derived SI unit of power is the **watt**. **2** (*in optics*) a measure of the ability of a lens or mirror to magnify, expressed as the reciprocal of the focal length of the lens or mirror in metres. **3** (*in mathematics*) **a** an alternative name for **exponent** or **index**; e.g. 2 to the power 3 = 2³. **b** one more than the cardinal number of times that a number or expression has to be multiplied by itself to give a required number; e.g. 2 to the power 3 = 2 × 2 × 2. **c** one more than the ordinal number of times that a particular number has to be multiplied by itself to give a required number; e.g. the third power of 2 is 8 = 2 × 2 × 2.

power calculation a statistical test used to assess how many samples have to be analysed to maximize success in answering a hypothesis, while minimizing the use of resources. Power calculations are used in genetic association studies.

poxvirus any member of the Poxviridae, a family of large, double-stranded DNA viruses, in class I of the **Baltimore classification**. They consist of a single molecule of DNA of 130–240 MDa together with

30 or more structural proteins, a number of enzymes, and lipid. Their hosts range from insects to mammals; examples include the viruses of variola (smallpox) and vaccinia (cowpox) – but not of varicella (chickenpox) – in humans, and the virus of myxomatosis in rabbits.

Pp symbol for the propionyl group.

PP abbr. for pancreatic polypeptide.

PP_i symbol for inorganic pyrophosphate. See **diphosphate**.

PPAR abbr. for peroxisome proliferator-activated receptor; any of a subfamily of nuclear receptors for hormones. Mice produce three isoforms. **PPAR α** predominates in liver, kidney, and heart. It binds leukotriene B₄ and heterodimerizes with retinoid receptor (RXR) to activate numerous genes. **PPAR α** and **PPAR γ** are activated by the hypolipidemic agent tetradecylthioacetic acid. **PPAR γ** is the dominant transcription factor of adipocyte precursors. It binds thiazolidinediones (synthetic antidiabetic agents). When phosphorylated by MAP kinase, **PPAR γ** inhibits adipogenesis. The ligand binding site of **PPAR** is homologous to that of the human estrogen receptor. In rats, but not in humans, clofibrate causes peroxisomal proliferation.

P particle a liberated, mature **kappa particle**.

ppb or **p.p.b.** abbr. for parts per billion, i.e. parts per 10⁹.

PPCA abbr. for **protective protein/cathepsin C**.

PP cell or (formerly) **F cell** a type of cell containing granules that store pancreatic polypeptide (**pancreatic hormone**). In adult humans such cells are located exclusively in the pancreas (79% in the islets, 19% in the acini, and 2% in the ducts).

pp[CH₂]pA symbol for adenosine 5'-[α,β -methylene]triphosphate; an analogue of ATP in which the α,β -bridging oxygen atom has been replaced by a methylene group.

PPF or **PP factor** abbr. for pellagra-preventative factor; an early name for **nicotinic acid** or **nicotinamide**.

ppGpp symbol for guanosine 3'-diphosphate 5'-diphosphate (also known as **magic spot I**). See **relA**, **spoT**.

p22-phox see **phagocyte NADPH oxidase**.

p47-phox see **phagocyte NADPH oxidase**.

p67-phox see **phagocyte NADPH oxidase**.

PPIase abbr. for peptidylprolyl isomerase.

PPLO abbr. for pleuropneumonia-like organism (i.e. **mycoplasma**).

ppm or **p.p.m.** abbr. for parts per million, i.e. parts per 10⁶.

PPO abbr. for 2,5-diphenyloxazole; a substance useful as a primary fluor in liquid scintillation counting.

pppGpp symbol for guanosine 3'-diphosphate 5'-triphosphate (also known as **magic spot II**). See **relA**.

PPRibP symbol for (5- γ -phospho(α -D)-ribose) diphosphate.

P protein a membrane protein of **melanosomes** that functions in ion transport into the melanosome and in maintaining its acidic pH. The protein consists of 838 amino acids and contains 12 putative transmembrane sequences. Its gene is at 15q11.12, and numerous mutations are associated with a form of oculocutaneous **albinism**.

P-protein abbr. for phloem protein; any structural protein of phloem, the principal food-conducting tissue of vascular plants. P-proteins are present usually at low concentration in phloem exudates, when they are called **sieve tube exudate proteins** (STEPs).

P-protein body any crystalline or amorphous accumulation of protein that may be present during sieve element differentiation in vascular plants. The bodies may be in equilibrium with soluble monomeric proteins.

PPS (in clinical chemistry) abbr. for pepsin A.

ppt 1 or **ppt.**; abbr. for precipitate. **2** or **p.p.t.** abbr. for parts per trillion, i.e. parts per 10¹².

PPT abbr. for **1** preprotachykinin (see **protachykinin β precursor**, **tachykinin**). **2** phosphinothricin.

PQ abbr. for plastoquinone.

PQH₂ abbr. for dihydroplastoquinone (i.e. **plastoquinol**).

PQQ abbr. for pyrroloquinoline quinone (i.e. **methoxatin**). See **quino**-**protein**.

Pr symbol for **1** praseodymium. **2** the propyl group.

Prⁱ symbol for the isopropyl group, (CH₃)₂CH–.

prazosin or **furazosin** a quinazoline antagonist of α_1 adrenoreceptors; it has anti-hypertensive properties.

pre+ or **pre-** prefix **1** before in time, position, sequence, rank, etc.;

compare pro+ (def. 1). **2** denoting a substance that moves faster (or further) than a specified substance in a separative procedure (e.g. prealbumin). Usage in this sense for naming proteins is now deprecated in order to avoid confusion with def. 3. **3** denoting a (usually metabolic) precursor, whether endogenous (e.g. prehormone, prekallikrein, pre-messenger RNA, preprotein, pretyrosine) or exogenous (e.g. precarcinogen), of the (class of) substance specified; **Compare pro+** (def. 3); see also **prepro+**.

PRE abbr. for proton relaxation enhancement.

prealbumin an operational (and confusing) term for either of two protein-containing zones observed to migrate more rapidly towards the anode than does serum albumin on zone electrophoresis of serum at pH 8.6 by some techniques. The faster-moving of these zones is now known to be **transthyretin**, and the other to be acidic α_1 -glycoprotein (i.e., **orosomucoid**).

prebiotic of or relating to the period before the appearance of living organisms on Earth.

precancerous describing a tissue or condition that is not yet malignant but is expected to form a cancer.

precarcinogen (sometimes) a chemical carcinogen that can be converted by metabolism into another of no less potency. **Compare proximate carcinogen**.

precarcinomatous describing a tissue that is expected to form a carcinoma.

P receptor see **purinoceptor**.

precerebellin a cerebellum-specific protein that is the precursor of cerebellin (a 16-residue peptide flanked by Val-Arg and Glu-Pro), which is a protein of the postsynaptic structures of Purkinje cells. Concentrations of cerebellin are low at birth, and (in humans) peak at days 5–15. Its sequence is conserved in mammals and birds.

precess to undergo, or cause to undergo, **precession**.

precession (slow) gyration of the axis of rotation of a spinning body caused by application of a torque such that the axis of rotation generates a cone.

precipitant an agent or a reagent that induces the formation of a precipitate.

precipitate 1 to (cause to) come out of solution or suspension. **2** substance or material that is precipitated. —**precipitation** *n*.

precipitating antibody an alternative name for **precipitin**.

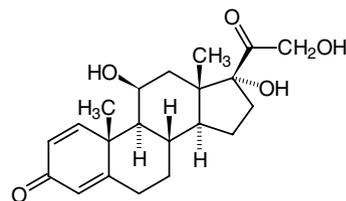

precipitin or **precipitating antibody** an antibody that is capable of reacting with a soluble antigen with the formation of an insoluble antigen–antibody complex.

precipitin reaction the reaction together of antigen and antibody near their equivalence point to form a cross-linked precipitate. Quantitative analysis of this interaction gives both the antibody content of an immune serum and an indication of the valency of the antigen. If the reaction occurs in a gel then the reactants form precipitin arcs.

precision 1 a measure of the sharpness (or certainty) of a measurement – a precise measurement may nevertheless be inaccurate (e.g. if there are unrecognized errors in the measurement). **2** or **selectivity** (in informatics) the proportion of the predictions made by an algorithm that are correct (i.e. discrimination of true matches from false): true positives/(true positives + false positives).

precision-bore (of tubing or a tubular object) having a lumen whose diameter varies only within extremely narrow limits.

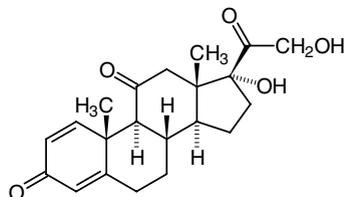

prednisolone 1,4-pregnadiene-11 β ,17 α ,21-triol-3,20-dione; a semi-synthetic steroid with glucocorticoid action. **Compare prednisone**.

prednisolone

prednisone

prednisone 1,4-pregnadiene-17 α ,21-diol-3,11,20-trione; a synthetic steroid with glucocorticoid action. *Compare prednisolone.*

preelectrophoresis a preliminary treatment of an electrophoresis gel in which a potential difference is applied in order to remove undesirable substances such as excess polymerization reagents.

preflashing the hypersensitization of photographic emulsion by a preliminary exposure to a brief (≈ 1 ms) flash of light in order to increase its sensitivity to low levels of radiation and to render its response more nearly linear. It is useful especially in fluorography and (auto)radiography.

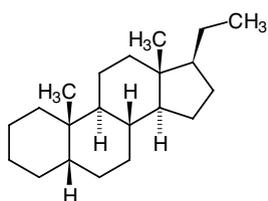

prefoldin or **Gim complex** (*abbr.* for genes involved in microtubule synthesis complex) a chaperone that cooperates in the proper folding of actin and tubulin by binding to their nascent polypeptide chains. In eukaryotic cytosol it is a ≈ 90 kDa complex of two α and four β subunits. Its structure is that of six alpha-helical coiled-coil tentacles arising from a beta-barrel body. It does not associate with the ribosome synthesizing the nascent chain and operates in an ATP-independent manner.

pregnancy-associated α_2 -glycoprotein *see pregnancy zone protein.*

pregnancy-associated plasma protein A *see PAPP-A.*

pregnancy zone protein *abbr.*: PZP; *other names*: pregnancy-associated α_2 -glycoprotein; α_2 -pregnoglobulin; a homotetrameric disulfide-linked proteinase inhibitor of the α_2 -macroglobulin family that inhibits all four classes of proteinase by a 'bait-and-trapping' mechanism (*see bait region*). One of the major human pregnancy-associated plasma proteins, it may reach levels of 1.0–1.4 g L⁻¹ just before term. It has extensive homology with human α_2 -macroglobulin. In the sequence (example below) amino acids 1–24 form the signal, 26–1482 are the pregnancy zone protein, and 685–735 the bait region.

pregnane a C₂₁ steroid to which **pregnanediol** is related.

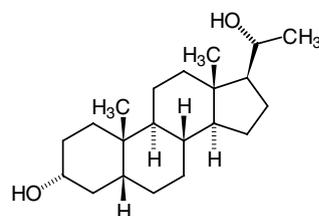

5 β -pregnane

pregnanediol a common name for the steroid 5 β -pregnane-3 α ,20 α -diol; (20S)-5 β -pregnane-3 α ,20-diol; the principal urinary metabolite of progesterone, occurring mainly as its 3-glucuronide. Its level in the urine increases during the luteal phase of the menstrual cycle and especially in the latter part of pregnancy, the excretion rate being a convenient (if approximate) index of the functional state of the corpus luteum and placenta.

pregnant mares' serum gonadotropin *abbr.*: PMSG; a clinically useful impure gonadotropin preparation extracted from the serum of pregnant mares – such serum has high activities of both follicle-stimulating hormone and luteinizing hormone. *Compare urogonadotropin.*

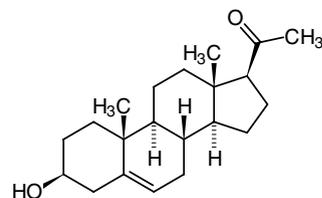

pregnenolone a common name for the steroid Δ^5 -pregnen-3 β -ol-20-one; 3 β -hydroxypreg-5-en-20-one; a key intermediate on the biosynthetic route from cholesterol to progesterone. It has gluco-

pre-mRNA processing protein

pregnanediol

corticoid activity and has been used in the treatment of rheumatoid arthritis. It is the product of **cholesterol monooxygenase (side-chain cleaving)**.

α_2 -pregnoglobulin *see pregnancy zone protein.*

prehybridization a procedure used for the treatment of nitrocellulose or nylon membranes following Northern or Southern transfer and before the use of labelled nucleic acid probes to detect specific sequences on the blot. The intention is to block the surface of the membrane to decrease non-specific binding of the probe. A variety of blocking agents can be used.

preincubate to bring a reaction mixture or a cell or tissue preparation to (chemical, metabolic, thermal, etc.) equilibrium before starting the reaction to be investigated. —**preincubation** *n.*

pre-initiation complex the complex formed on a gene promoter by RNA polymerase II and the general transcription factors, especially TFII, before initiation of transcription of the gene.

prekallikrein a plasma glycoprotein of 88 kDa (bovine), and a **blood coagulation** factor. It is the precursor of the protease **kallikrein**, to which it is converted by the action of factor XIIa. The protein contains four **apple domains**. The active site contains His, Asp, and Ser residues characteristic of a **charge-relay system**.

prelysosomal vacuole or **prelysosome** a former name for **endosome** (*def.* 1).

pre-messenger RNA *abbr.*: pre-mRNA; the class of primary gene transcripts from which the corresponding messenger RNA molecules are subsequently formed by post-transcriptional processing; any member of this class. It comprises a substantial part of **heterogeneous nuclear RNA**.

pre-miRNA the product of **Drosha** activity on **pri-miRNA** and a substrate for **Dicer**.

pre-mRNA *abbr.* for pre-messenger RNA.

pre-mRNA processing protein (*abbr.*: PRP protein) or **pre-mRNA splicing factor** any of the proteins involved in processing the primary transcript RNA. Many of them function as components of a **spliceosome**. Most are components of snRNP particles, which are numbered U1, U2, etc. The following examples are mostly from yeast (*Saccharomyces cerevisiae*): PRP2 is an ATP-binding RNA helicase required for the first cleavage ligation reaction; PRP5 is an ATP-binding RNA helicase required for unwinding of pre-mRNA, and is part of the spliceosome, a so-called **DEAD-box** helicase; PRP8 is a U5 snRNP protein; PRP9 is required for U2 snRNP to bind to pre-mRNA; PRP15 is an RNA-dependent ATPase required for branch-point recognition; PRP16 is an RNA helicase (another **DEAD-box** helicase); PRP18 is a component of the U4/U5/U6 snRNP, and is a homodimer; PRP19 is a U2-binding protein of unknown function; PRP21 is probably involved in retention of pre-mRNA in the nucleus; PRP22 is a **DEAD-box** helicase involved in

release of spliced mRNA from the spliceosome; PRP28 is a DEAD-box helicase involved in U4/U5/U6 SnRNA; PRP38 is involved in maintenance of U6 snRNA; PRP39 facilitates interaction between U1 snRNP and the 5'-splice site.

preurein-leader peptidase EC 3.4.99.35; *other names*: lipoprotein-signal peptidase; signal peptidase II; SPase II. An enzyme that cleaves a single bond between Gly²⁰ and alkylated Cys²¹ in a bacterial lipoprotein, detaching the leader peptide.

premutation an expanded triplet repeat region of intermediate size in a gene, that does not of itself cause a disease. However, it is likely to increase in length during meiosis and to cause the disease in subsequent generations. In **fragile X syndrome** the (CGG)_n repeat may increase in length during meiosis in the mother, more so than in the father. The risk that there will be expansion is proportional to the number of repeats and is 99% for repeat lengths of greater than 90. *See* **anticipation**.

prenol the recommended name for any isoprenoid of general formula H-[CH₂-C(CH₃)=CH-CH₂]_n-OH; i.e. any primary monohydroxy alcohol whose carbon skeleton consists of two or more isoprene residues linked head to tail. *See also* **polyprenol**.

prenyl the univalent alkyl group derived from a **prenol** by loss of its hydroxyl group. *See also* **polyprenyl**. *Compare* **isopentenyl**.

prenylation the enzymic addition of **prenyl** moieties to proteins as a post-translational modification; **geranyl**, **farnesyl**, or **geranylgeranyl** groups may be added. The process involves reaction of a prenyl diphosphate with a cysteinyl sulfhydryl group near the C terminus of the protein, to give a prenyl-S-Cys moiety. Characteristically a Cys-ali-ali-Xaa sequence is recognized by the transferase that mediates the reaction, where Cys is cysteine, ali is an aliphatic amino acid, and Xaa is any amino acid. When Xaa is serine, alanine, or methionine the protein is farnesylated; when Xaa is leucine it is geranylgeranylated, but this is variable; for example, in the case of Rab 3A (*see* **RAB**), the Cys-Xaa-Cys motif leads to geranylgeranylation on both cysteine residues and methyl esterification of the terminal carboxyl, while in other members of the Rab family Cys-Cys directs geranylgeranylation without esterification. The function of the process appears often to be regulation of protein-protein and protein-membrane interaction.

prenyltransferase *see* **dimethylallyltranstransferase**.

PR-enzyme an old name for **1 phosphorylase phosphatase** (EC 3.1.3.17). [PR stood originally for prosthetic-group removing, later for phosphorylase rupturing, and later still for phosphate removing.] **2** deoxyribodipyrimidine photo-lyase (EC 4.1.99.3). [PR stood for photoreactivating.]

preparative ultracentrifuge any ultracentrifuge designed for preparation or purification of tangible quantities of macromolecular substances, subcellular fractions, etc.

pre-part or **pre-peptide** an alternative name for **signal peptide**.

prephenate a trivial name for 2-oxo-3(1-carboxylato-4-hydroxy-2,5-cyclohexadiene-1)-propanoate; a nonaromatic intermediate in the branched biosynthetic pathway (the **prephenate pathway**) from chorismate to phenylalanine or tyrosine in most autotrophic organisms. *See also* **arogenate**.

prephenate dehydratase EC 4.2.1.51; *systematic name*: prephenate hydrolyase (decarboxylating); an enzyme that catalyses the formation of phenylpyruvate from prephenate with release of H₂O and CO₂ in a pathway for the biosynthesis of phenylalanine. In other cases (e.g. *Escherichia coli*) the activity is in the N-terminal domain of a bifunctional enzyme that also contains **chorismate mutase** (another enzyme of the phenylalanine biosynthetic pathway). *See also* **arogenate**.

prephenate dehydrogenase any enzyme that converts prephenate to 4-hydroxyphenylpyruvate with release of CO₂ and reduction of either NAD⁺ or NADP⁺. They function in the pathway for the biosynthesis of aromatic amino acids, to initiate the branch leading to tyrosine biosynthesis. They include prephenate dehydrogenase, EC 1.3.1.12; *systematic name*: prephenate:NAD⁺ oxidoreductase (decarboxylating); *other name*: hydroxyphenylpyruvate synthase; an enzyme that also has **chorismate mutase** activity, so can convert chorismate to hydroxyphenylpyruvate. There is also prephenate dehydrogenase (NADP⁺), EC 1.3.1.13; *systematic name*: prephenate:NADP⁺ oxidoreductase (decarboxylating).

prephenate pathway a pathway for the synthesis of phenylalanine and tyrosine from chorismate, utilizing prephenate as an intermediate. Prephenate is formed from chorismate by **chorismate mutase**. It is converted by **prephenate dehydrogenase** to 4-hydroxyphenylpyruvate, from which tyrosine is formed by transamination with glutamate as the amino-group donor. For the synthesis of phenylalanine, phenylpyruvate is formed by **prephenate dehydratase**, and is then converted to phenylalanine by transamination, glutamate again acting as amino-group donor. *See also* **arogenate**.

pre-piece an alternative name for **signal peptide**.

prepolypeptide or **presecretoary polypeptide** the transient, primary translation product of a eukaryotic messenger RNA for any polypeptide destined to be secreted by a cell, irrespective of whether an intermediary **propolypeptide** is formed; the polypeptide counterpart of **preprotein**. *See also* **prepropolypeptide**.

prepro+ or **prepro-** compound prefix denoting the presence in a secretory polypeptide or protein of the N-terminal signal sequence and any other sequence than the polypeptide or protein of interest.

preprocessing enzymic conversion of a preprotein (or prepropolypeptide) to a proprotein (or propolypeptide).

preprohormone the presecretoary precursor of a polypeptide or protein hormone, which contains the N-terminal signal sequence, the sequence of the hormone of interest, and any other sequence. Examples are: preproglucagon, preproinsulin, preproparathyrin, prepro-VIP.

preprophase band a dense band of microtubules, 1–3 μm wide, that appears just beneath the cell membrane before prophase of cell division in higher plants. It disappears as mitosis begins, yet it somehow determines the plane of orientation of the new cell plate forming in late telophase and marks the zone of the parental cell wall where fusion with the growing cell plate ultimately occurs.

prepropolypeptide the prepolypeptide of any propolypeptide: e.g., preproenkephalin and prepromelittin.

preprotein the preprotein of any proprotein: e.g., preproalbumin (serum) and prepro-von Willebrand factor. Note that preprolactin is not a preprotein, as prolactin is not a proprotein.

preprotachykinin *abbr.*: PPT; *see* **protachykinin β precursor**.

preprotein the transient, primary translation product of a eukaryotic messenger RNA for any protein destined to be secreted by a cell, irrespective of whether an intermediary **proprotein** is formed. It is detectable only in a cell-free protein-synthesis system, as in an intact cell its N-terminal presequence (i.e., **signal peptide**) is cleaved off before translation has been completed. *See also* **prepolypeptide**, **preproprotein**.

prereplication complex another name for origin of replication complex. *See* **ORC**.

presecretoary polypeptide an alternative name for **prepolypeptide**.

presenilin either of two multipass transmembrane proteins, mutation of which results in familial **Alzheimer's disease**.

presequence an alternative name for **1 signal peptide**. **2** transport sequence (of a protein imported into mitochondria), especially in those instances where the sequence is not removed by proteolytic cleavage prior to translocation through the membrane, but is removed at its final destination.

pressor (*in physiology*) **1** of, relating to, or bringing about an increase in arterial blood pressure. **2** any drug or other agent that has a pressor effect.

pressure *symbol*: *p* or *P*; the force per unit area acting on a surface; i.e. $p = F/A$. The pressure at a point in a fluid is equal to the force per unit area on an infinitesimal plane situated at that point, and in a fluid at rest it is the same in all directions. The SI derived unit of pressure is the **pascal**; the **bar** is also acceptable (*see* **standard atmosphere**). *See also* **millimetre of mercury**, **torr**.

pressure dialysis dialysis in which a hydrostatic pressure is applied to the material being dialysed in order to minimize its initial dilution by solvent entering by osmosis.

pressure homogenization or **nitrogen cavitation** a method of disrupting cells that depends on equilibrating a cell suspension with a gas, e.g. nitrogen, at high pressure (up to 7 MPa) and then suddenly reducing the pressure, whereupon the gas dissolved in the cytoplasm is explosively released.

pressure-jump method a relaxation technique in which change of pressure is the disturbing factor. *See* **relaxation kinetics**.

pre-steady-state kinetics or **transient-phase kinetics** the kinetics of a catalysed reaction during the phase in which the concentration of the catalyst–reactant complex rises from zero to its steady-state value. For an enzyme-catalysed reaction this phase usually occupies a very brief period of time (from a second to a microsecond or less) and special techniques are required for its study. *See also* **rapid reaction kinetics**.

prestin an integral membrane motor protein responsible for the electromotility of outer hair cells of the mammalian cochlea. It contains 12 transmembrane segments and is located in the basolateral membrane, where it undergoes structural rearrangement in response to transmembrane voltage changes. Intracellular chloride and bicarbonate ions bind to prestin and trigger the structural change.

pre-swollen describing a commercial gel preparation that has already been equilibrated with water or another liquid phase.

presynaptic 1 (*in anatomy*) a designating a neuron that transmits an impulse directly to a synapse. **b** of or pertaining to that part of such a neuron close to the synapse. **2** (*in cytology*) prior to meiotic synapsis.

presynaptic membrane *see* **synapse**.

presynaptic nerve ending *see* **synapse**.

pre-transfer RNA *abbr.*: pre-tRNA; the class of primary gene transcripts from which the corresponding transfer RNA molecules are subsequently formed by post-transcriptional processing; any member of this class.

pretransition temperature the specific temperature at which a lipid bilayer being heated shows the first signs of **melting** (def. 2), before it reaches its transition temperature. Special techniques (e.g. employing spin-labelled or fluorescent probes) are required for its detection and study.

pretyrosine an obsolete name for **arogenate**.

previtamin a less common word for **provitamin**.

PRF *abbr.* for Protein Research Foundation; *see* **sequence database**.

PRG-1 *abbr.* for plasticity-related gene-1; a gene expressed in rat hippocampal neurons during active axonal outgrowth. It encodes a membrane-associated phospholipid phosphatase that modulates the extracellular phospholipid concentration and regulates axonal outgrowth.

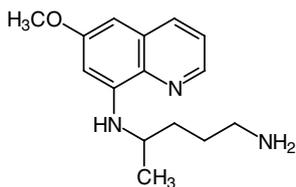

Pribnow box a promoter site in *Escherichia coli* and phage genes that specifically binds **RNA polymerase**. The Pribnow box has the consensus sequence TATAAT and is centred at –10 (ten nucleotides on the 5' side of the first nucleotide transcribed, which is designated +1).

PRibPP symbol for (5-)-phospho(α-D)-ribose diphosphate.

primaevial soup a variant spelling of primeval soup; *see* **primordial soup**.

primaapterin or **7-biopterin** the 7-isomer of **biopterin** that is formed nonenzymatically from tetrahydrobiopterin. The reaction is prevented by a bifunctional protein (103 amino acids) that has **pterin-4α-carbinolamine dehydratase** (PCD) activity and is also the dimerization cofactor for hepatocyte nuclear factor 1a (DCoH). Several mutations in PCD result in hyperphenylalaninemia and primaapterinuria.

primaquine one of several 8-aminoquinoline antimalarial drugs. It is active against the exo-erythrocytic form of the parasite, and can effect radical cures as well as serving as a preventive medicine. Primaquine sensitivity is a hemolytic anemia that occurs in persons deficient in glucose 6-phosphate dehydrogenase.

primary (*in chemistry*) **1 a** describing an alkyl compound (e.g. an

alkanol) in which the functional group (e.g. a hydroxyl group) is attached to a carbon atom linked to only one other. **b** describing the carbon atom bearing the functional group in such a compound. **2** describing an amide or an amine in which a single appropriate group is attached to a nitrogen atom. **3** describing a salt formed by replacing only one of the ionizable hydrogen atoms of a tribasic acid by another cation. *Compare* **secondary**, **tertiary**.

primary cell wall the outer layer of the wall of a plant cell. It is produced by deposition of cellulose microfibrils against the cell plate separating two daughter cells newly formed by division. When cell extension is complete, it is supplemented by deposition of the secondary cell wall (*see* **secondary cell wall deposition**).

primary culture a culture of cells (or tissue) that have been obtained directly from their place of origin.

primary database an alternative name for **sequence database**.

primary electron an electron incident on a surface that causes **secondary electrons** to be emitted.

primary F'-containing strain *see* **F' plasmid**.

primary fluor or **primary scintillator** or **primary solute** (*in liquid scintillation counting*) the fluorescent substance to which radiation energy is directly transferred from excited molecules of the solvent. *Compare* **secondary fluor**.

primary granule an alternative name for **azurophil granule**.

primary hormone a term proposed to embrace any hormone that acts rapidly and uses a cyclic nucleotide as second messenger.

primary immune response the response produced in an animal when it is first exposed to an antigen. It consists characteristically of a slow production of antibody molecules and the priming of lymphoid tissue in readiness for the production of a **secondary immune response** on subsequent challenge with the same antigen.

primary kinetic isotope effect an **isotope effect** on a reaction rate that is attributable to isotopic substitution of an atom to which a bond is made or broken in the rate-limiting step or in a pre-equilibrium step of a specified reaction.

primary lysosome or **protolysosome** a **lysosome** that is a precursor of a **secondary lysosome**.

primary metabolism the ensemble of metabolic activities that are common to most if not all living cells and are necessary for growth, maintenance, and survival. *Compare* **secondary metabolism**.

primary metabolite any intermediate in, or product of, **primary metabolism**.

primary response *see* **primary immune response**.

primary scintillator an alternative name for **primary fluor**.

primary solute an alternative name for **primary fluor**.

primary solvent (*in liquid scintillation counting using mixed solvents*) the solvent to which energy of the radiation emitted by the specimen is first transferred as excitation energy.

primary standard 1 any standard of measurement of nationally or internationally agreed and specified value that is used as the basis of a unit of measurement. **2** a specimen of a particular substance that is of extremely high purity and stability and that serves as an ultimate reference to which may be compared the purity of any secondary standard used in analysis.

primary structure the first order of complexity of structural organization exhibited by polypeptide and protein molecules, and by polynucleotide and nucleic-acid molecules. When applied to a segment of a polypeptide chain, or to a polypeptide or protein molecule, it refers to the linear sequence of the amino-acid residues of the polypeptide chain(s), without regard to spatial arrangement, apart from configuration at the α-carbon atoms (and excluding the positions of any disulfide bonds). When applied to a segment of a polynucleotide chain, or to a polynucleotide or nucleic-acid molecule, it refers to the linear sequence of the nucleotide residues of the polynucleotide chain(s), without regard to spatial arrangement. *Compare* **secondary structure**, **tertiary structure**, **quaternary structure**.

primary transcript the RNA as synthesized by RNA polymerase directly from a gene, unaltered by any further modification, such as **splicing**, that it may undergo.

primase 1 any RNA polymerase that synthesizes an RNA primer needed for the initiation of DNA synthesis. Such enzymes vary greatly in structure, specificity, and mode of regulation. **2** or **DNA primase** the DNA-directed **RNA polymerase** (EC 2.7.7.-) of the bacte-

rial **primosome**. In *Escherichia coli*, primase is the product of the *dnaG* gene while in T4 phage the primase is the product of gene 61. In either case, the primase is only active in the presence of other proteins which create a complex called a **primosome**. The complex participates in the unwinding of parental DNA strands ahead of the replication fork, and synthesizes short RNA primers for the **Okazaki fragments**.

primate any member of the Primates, an order of placental mammals. Primates are characterized by flexible pentadactyl limbs, opposable first digits, good stereoscopic vision, and, in the higher apes, highly developed brains. Included are lemurs, tarsiers, monkeys, apes, and humans.

prime **1** the printer's character, ', used (singly, doubly, etc.) as a mark to discriminate between characters or symbols representing things that are or would otherwise be indistinguishable. In chemical nomenclature it is used to distinguish between (1) identical locants referring to different moieties of the same molecule; or (2) two or more unspecified but differing univalent groups represented by the same symbol R. In physical chemistry it is used to differentiate the symbol for a quantity measured under arbitrary conditions from that for the corresponding quantity referred to the (thermodynamic) standard state; e.g. K' , apparent equilibrium constant, from K , thermodynamic equilibrium constant; E'_0 , standard redox potential at a specified pH, from E_0 , standard redox potential at a hydron activity of unity. **2** (in *biochemistry*) to provide a metabolic reaction with a primer; to bring about activation of a process or substrate. **3** (in *immunology*) to induce a **primary immune response** in an animal; to activate a cell specifically with respect to a given antigen. **4** (in *mathematics*) **a** having no other integral factor than itself and one. **b** **prime number**.

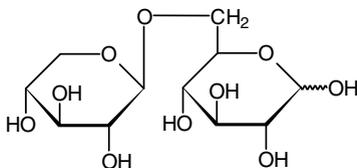

prime number any integer that possesses no integral factors and hence is divisible only by itself and 1.

primer **1** something used to **prime** (def. 2, 3). **2** an oligonucleotide required as the starting point for the stepwise synthesis of a polynucleotide from mononucleoside triphosphates by the action of a nucleotidyltransferase. **3** a short-chain fatty acyl-CoA, e.g. acetyl-CoA or butyryl-CoA, required for the initiation of the stepwise enzymic synthesis, from two-carbon units, of long-chain fatty acids as their CoA derivatives. See also **glycogenin**.

primer extension a technique used to map the 5' ends of mRNA transcripts and thereby identify the exact position of the transcription start site in the sequence of a gene. A labelled antisense oligonucleotide primer is hybridized to mRNA close to the 5' end and extended by the action of reverse transcriptase. The length of the resulting cDNA reflects the distance between the labelled oligonucleotide and the 5' end of the mRNA template.

primeval soup or (esp. Brit.) **primaevial soup** an alternative name for **primordial soup**.

primeverose 6-*O*- β -D-xylosyl-D-glucose; a disaccharide occurring in madder.

pri-miRNA *abbr.* for primary transcript **miRNA**, a substrate for **Drosha**.

primordia the plural of **primordium**.

primordial existing at or from the beginning, primeval; earliest formed, primitive.

primordial soup or **primordial slime** or **primeval soup** or (esp. Brit.) **primaevial soup** the aqueous solution of organic compounds that is considered to have been the environment in which the synthesis of macromolecules first occurred and cellular life originated. See also **coacervate droplet**.

primordial (*pl.* **primordia**) an organ or part at the earliest stage of its development; a rudiment.

primosome a protein complex that is essential for the activity of the

primase responsible for the synthesis of RNA primers in the replication of DNA in *Escherichia coli*. See **replication complex**, **replication of DNA**.

PRINTS see **pattern database**.

prion a protein originally identified as the transmissible pathogenic agent responsible for prion diseases, such as **scrapie**, **kuru**, **bovine spongiform encephalopathy**, **Creutzfeldt-Jakob disease**, and **Gerstmann-Sträussler syndrome**. The agent is now widely accepted to be a variant of the normal **prion protein**; it is believed that the variant folds abnormally, and induces the normal protein also to fold abnormally, typically into beta conformations that form aggregates. See also **fatal familial insomnia**.

prion protein *abbr.*: PrP^C; a membrane protein of 33–35 kDa that is encoded in the mammalian genome; it contains, in humans, 253 amino-acid residues (near the same number in other species), and has a glycosylinositol phospholipid anchor. A variant, termed PrP^{Sc}, with the same amino-acid sequence, is found in the brains of sheep and other mammals affected by **spongiform encephalopathy**. PrP^C is rich in α -helix, while PrP^{Sc} contains much β -sheet. PrP^{Sc} associates to form aggregates ('rods') in the central nervous system; such aggregates are seen in many manifestations of spongiform encephalopathy. Polymorphism, e.g. at position 171, occurs in several species and in subgroups in one species, and may be important with respect to disease susceptibility.

prism **1** any polyhedron of which two faces are polygons in parallel planes and the other faces are parallelograms. **2** a crystal form of which three or more faces are parallel to one axis. **3** a solid, bounded in part by two nonparallel plane faces and made of material transparent in the relevant region of the spectrum, that is used in optics to invert an image or to disperse or deviate a beam of light.

PRKAG3 *abbr.* for protein kinase AMP-dependent gamma chain 3. See **AMPK**.

PRL *abbr.* for prolactin.

pro+ or **pro-** **prefix** **1** before in time or position; anterior; projecting; compare **pre+** (def. 1). **2** for, on behalf of, substituting for, favouring, encouraging, etc. **3** (in *biochemistry*) denoting (inactive or less active) biosynthetic precursor of the (class of) proteinaceous agent specified, to which it is convertible by proteolytic cleavage in a specific manner. Examples are: proalbumin, prohormone, proinsulin, proprotein, and prothrombin (but not prolactin!). Compare **pre+** (def. 3). See also **+gen**.

Pro symbol for a residue of the α -amino (strictly, cyclic α -alkylamino) acid L-proline (alternative to P).

pro- **prefix** in symbols designating prochirality; see **pro-R/pro-S convention**.

proaccelerin an alternative name for factor V; see **blood coagulation**.

probability (in *statistics*) symbol: *p* or *P*; a measure of the likelihood of the occurrence of a given event, expressed as the ratio of the number of times it occurs in a series of observations to the total number of observations, or as its decimal equivalent.

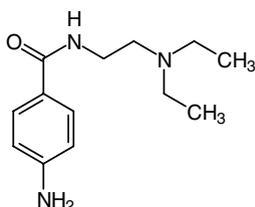

probable error an older measure of sampling variability such that one-half of the events, observations, etc. in a **normal distribution** lie between the mean value minus the probable error and the mean value plus the probable error. The probable error is equal to the standard error multiplied by 0.6745.

proband an alternative term for **propositus**.

probe **1** something that searches into, examines, or tests; e.g. an instrument or tube used for exploring a cavity or sampling a fluid, or an electric conductor introduced into an electric circuit or a cavity resonator to provide electric coupling to an external circuit. **2** (in *biochemistry*) a chemical species, or a chemical group attached to a carrier molecule, used to investigate the chemical nature of some other particular chemical species or the physical nature of a particular environment, especially within an intact cell; a **reporter group**. Typically some measurable physical property of the probe (e.g. fluorescence, electron spin resonance) alters in a way that can be correlated with changes in the environment or in the macromolecule. Examples are a group having paramagnetic properties, for detection using electron spin resonance (see, e.g., **TEMPO**), and a fluorescent lipid molecule used to report membrane fluidity (see, e.g., **parinaric acid**). **3** (in *molecular biology*) or **gene probe** or **hybridization probe** an oligo- or polynucleotide that is complementary to an

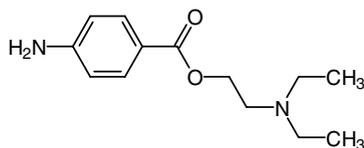

oligonucleotide or nucleic-acid sequence under investigation. The probe is normally labelled in a way that permits its ready detection, e.g. with a radioactive isotope or a fluorescent constituent. Hybridization of the probe to the oligonucleotide sequence under investigation allows that sequence to be detected. The technique finds much use in screening gene libraries, detecting oligonucleotides on blots of electrophoresis gels, and in other associated technologies. **4** to examine with or as with a probe.

procainamide a local anaesthetic similar in action to **procaine** but having a less easily hydrolysed amide linkage, which gives it longer duration of action.

procainamide azide a local anaesthetic; it binds the 43 kDa post-synaptic protein (μ chain or rapsyn) of the nicotinic **cholinoceptor** and is useful as a photoaffinity label.

procaine or **novocaine** the prototype injectable local anaesthetic. It brings about changes in the physical properties of the lipid bilayer towards a more fluid state, decreasing ordering of the fatty-acyl side chains.

procapsid a precursor of the virion of certain viruses, consisting of a viral capsid without its specific nucleic acid.

procarboxypeptidase component III a protein, resembling **elastase** but without enzyme activity, found in the pancreatic juice of ruminants in noncovalent association with zymogens, carboxypeptidase A, etc. It probably prevents denaturation of the latter in the acid of the duodenum.

procaryon a variant spelling of **prokaryon**.

procaryote a variant spelling of **prokaryote**.

process (in anatomy) a thin prominence or protuberance of a structure, or an extension or outgrowth of a cell.

processed gene a **pseudogene** that lacks the intervening sequence or sequences of the homologous functional gene. It usually contains a short segment consisting entirely or almost entirely of adenine nucleotides, attached near the 3' end, and is thought to originate by reverse transcription of an mRNA template with incorporation of the cDNA so formed into genomic DNA. A processed gene is sometimes called a **retrogene**.

processing (in molecular biology) **covalent modification** either of the primary transcription product (i.e. RNA) of a DNA or of the primary translation product (i.e. polypeptide) of a messenger RNA. See also **post-translational modification**.

processing body see **P body**.

processive (in molecular biology) or **nondistributive** describing (the action of) any enzyme or catalytic complex that progressively synthesizes or degrades a biopolymer by effecting several or many cycles of the same type of reaction or reaction sequence without dissociating from the template or intermediate product (as appropriate) between catalytic events. Compare **distributive**.

processivity (of a nucleic acid polymerase) the average number of nucleotides inserted before the enzyme dissociates from its template. In the case of DNA polymerases, repair enzymes (such as Pol

I in *Escherichia coli*) have low processivity replication enzymes (such as Pol II and its associated proteins in *E. coli*) have high processivity.

processivity clamp an alternative name for proliferating cell nuclear antigen. See **PCNA**.

processosome a hypothetical ribonucleoprotein associated with processing of pre-RNA in the nucleolus.

prochiral describing a molecule, or a centre or axis in a molecule, that in itself is achiral but is capable of becoming **chiral** by a replacement reaction. In general, a prochiral molecule has a structure *Caabc*, where the 'a' groups (or atoms) are identical. Replacement of one 'a' by another group or atom, 'd', leads to a chiral molecule. Thus, in ethanol, replacement of one ¹H of the methylene group by ²H leads to a chiral structure which can be shown to be optically active. In a prochiral molecule *Caabc*, the chemically like 'a' groups may be differentiated one from another in a reaction with a chiral molecule, especially an enzyme. An achiral molecule containing a double bond or a planar cyclic ring system is also prochiral if separate addition of an achiral reagent to each face leads to two enantiomeric products. See also **meso-carbon atom**, **pro-R/pro-S convention**.

—**prochirality** *n*.

procholecystokinin precursor a member of the gastrin/cholecystokinin family, and a precursor for five different **cholecystokinins**.

prochromacin the sequence that comprises residues 79–439 of human chromogranin A. It is bacteriostatic and antifungal by forming membrane ion channels, and is the precursor of four active peptides: chromacin (residues 176–197), pancreastatin (250–301), catestatin (352–372), and parastatin (357–428). See **chromogranin**.

Procion the proprietary name for a range of reactive dyes that includes Procion Blue H-B, Procion Red H-E3B, as well as a number of other dyes useful in biochemistry, especially in **dye-ligand chromatography**.

procoagulant (sometimes) any of factor V, factor VII, or factor VIII, each of which acts to accelerate the conversion of prothrombin to thrombin during **blood coagulation**.

procollagen an ~150 kDa triple-helical protein that is an intermediate in the biosynthesis of **triplecollagen**, into which it is converted proteolytically by removal of the additional sequences at both the N and the C termini of each of the three peptide chains. Compare **procollagen**.

procollagen C-endopeptidase an alternative name for bone morphogenetic protein 1.

procollagen N-endopeptidase EC 3.4.24.14; other name: procollagen N-proteinase; an enzyme that catalyses the cleavage of the N-propeptide of collagen chain α -1(I) at Pro-|-Gln and of chain α -2(II) at Ala-|-Gln. Mutations at these sites lead to Ehlers–Danlos syndrome type VII. Inactivating mutations in the enzyme lead to dermatosparaxis of cattle.

procollagen-lysine 5-dioxygenase EC 1.14.11.4; other names: procollagen-lysine,2-oxoglutarate 5-dioxygenase (*abbr.*: PLOD); lysine hydroxylase; lysine,2-oxoglutarate 5-dioxygenase; an enzyme that catalyses the formation of hydroxylysine residues in collagen. The reaction is between dioxygen, procollagen L-lysine, and 2-oxoglutarate to form procollagen 5-hydroxy-L-lysine, succinate, and CO₂. Iron and **ascorbic acid** are cofactors. There are three genes for PLOD in humans. Several inactivating mutations in PLOD1 cause Ehlers–Danlos syndrome type VI. See also **procollagen-proline dioxygenase**.

procollagen-proline 4-dioxygenase EC 1.14.11.2; systematic name: procollagen-L-proline,2-oxoglutarate:oxyggen oxidoreductase (4-hydroxylating); other names: proline,2-oxoglutarate-4-dioxygenase; procollagen hydroxylase; proline hydroxylase; prolyl 4-hydroxylase. An enzyme that catalyses a reaction between dioxygen, procollagen L-proline, and 2-oxoglutarate to form procollagen *trans*-4-hydroxy-L-proline, succinate and CO₂. Hydroxylation only occurs during translation. **Ascorbic acid** and Fe³⁺ are also required as cofactors, and the reaction is one of the few well-defined roles for ascorbic acid; it seems likely that scurvy, as a result of vitamin C deficiency, is due to defective activity of this enzyme, which plays a key role in collagen synthesis. The enzyme contains two α chains and two β chains; the β chain is the multifunctional **protein disulfide isomerase** and hence has microsomeal triacylglycerol transfer protein

activity. It resides in the endoplasmic reticulum lumen. Two forms of the α subunit are produced by alternative splicing from the same gene. See also **procollagen-lysine 5-dioxygenase**.

proconvertin an alternative name for factor VII; see **blood coagulation**.

procarticotropin or **procortin** an alternative name for **proopiomelanocortin**.

procyclin or **PARP** a major surface antigen of procyclic forms of trypanosomes. It is GPI-anchored.

ProDom see **cluster database**.

prodrug a drug that is inert but has pharmacological effects after **bioactivation**. An example is **ganciclovir**.

produce (in mathematics) to extend a line or a plane.

product 1 (in biochemistry and chemistry) something formed in a reaction. **2** (in mathematics) the result of multiplying together two or more numbers, quantities, or expressions.

product inhibition the inhibition of an enzymic reaction caused by increased concentration of one or more products of that reaction.

productive (capable of) yielding a product, result, or benefit.

productive binding or **eutopic binding** the binding of a substrate in a reactive mode at the active site of an enzyme. Compare **nonproductive binding**.

productive complex any enzyme-substrate complex in which the substrate is bound to the enzyme in a manner that renders catalysis possible so that products can be formed. Compare **abortive complex**.

productivity (in biotechnology) symbol: r ; the mass of product formed per unit reactor volume per unit time; often per unit of enzyme or biomass. It is measured typically in $\text{kg m}^{-3} \text{h}^{-1}$.

prodynorphin see **dynorphin**.

proenkephalin a protein precursor for several neuropeptides, including various **enkephalins** formed in brain and adrenal medulla. For example, in the human, proenkephalin A precursor yields four copies of [Met]enkephalin (100–104; 107–111; 136–140, 210–214) and single copies of each of [Leu]enkephalin (230–234), [Met]enkephalin-Arg-Gly-Leu (octapeptide) (186–193), and [Met]enkephalin-Arg-Phe (heptapeptide) (261–267), which arise by enzymatic cleavage of the gene product by cleavage at paired basic amino acids. Another human protein, proenkephalin B precursor (other name: β -neoendorphin-dynorphin precursor) yields single copies of α -neoendorphin, dynorphin, [Leu]enkephalin, rimorphin, and leumorphin, also by cleavage at paired basic amino acids.

proenzyme an alternative name for **zymogen**.

pro-E/pro-Z convention if the two chemically-like hydrogen atoms of $abC=CH_2$ are separately replaced by the achiral, d , an achirotopic stereogenic element is generated and two (diastereoisomeric) alkenes, $abC=CHd$ are formed that are E and Z stereoisomers (see **E/Z convention**). The replacement has converted a prostereogenic element into which one which is stereogenic; the situation is comparable to the change, prochiral \rightarrow chiral, although a chiral element is not involved. The two chemically-like hydrogen atoms are designated as $pro-E$ and $pro-Z$, and are abbreviated as H_e and H_z . Replacement of a $pro-E$ hydrogen with 2H yields an E diastereoisomer and the similar replacement of a $pro-Z$ hydrogen yields the Z form. Example: the two hydrogen atoms of phosphoenolpyruvate; that on the same side of the double bond as the COOH group is H_e , that on the same side as the OPO_3H_2 group is H_z . Replacement of 1H_e by 2H yields (E)-[3- 2H]phosphoenolpyruvate; the Z diastereoisomer results if 1H_z is replaced by 2H . A similar situation is found in the side chain of **chorismic acid**.

proestrus see **estrous cycle**.

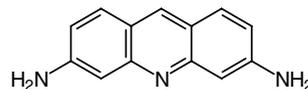

profibrinolysin an alternative name for **plasminogen**.

profile (in sequence analysis) a scoring table that encodes the residue conservation within an aligned domain, used to provide a diagnostic signature for that domain. Profiles provide differential scores/penalties for matches, deletions, or insertions, and for transitions between these states. They are included as a supplement to the regular expressions in the PROSITE database. Compare **hidden Markov model**.

profilin any of a family of globular proteins (123–139 amino acids) that prevent the polymerization of actin. Profilins are ubiquitous in eukaryotes and consist of a five-stranded beta sheet and three small

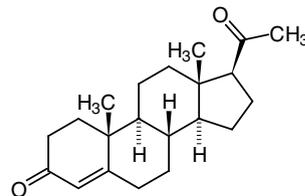

alpha helices. They bind dynamin and clathrin and localize with them in axons and dendrites, and bind diaphanous in hair cells of the inner ear. They compete with cofilin for ADP-actin, and promote exchange of the ADP for ATP. In mice profilin is essential for life. Profilin binds $PtdInsP_2$ and inhibits the γ isoform of phospholipase C (see **phospholipase**), an inhibition that is overcome by receptor kinase-dependent tyrosine phosphorylation.

proflavin 3,6-diaminoacridine; an **acridine** dye that intercalates between adjacent base pairs in duplex DNA. It is useful as an antibacterial agent, by inhibiting the biosynthesis of both DNA and RNA, possibly through intercalation into preexisting DNA, and as a frameshift mutagen for bacteriophages.

progeria any of two rare hereditary syndromes characterized by premature ageing in children (see **Hutchinson-Gilford syndrome**) or in adults (see **Werner syndrome**).

progesterone the common name for pregn-4-ene-3,20-dione; the principal steroid hormone of the corpus luteum, secreted during the latter half of the estrous cycle and acting upon the endometrium to prepare it for embryo implantation. During pregnancy, secretion occurs also from the placenta, increasing markedly as pregnancy proceeds, when it acts to maintain the uterus, inhibit further release of ova, and promote proliferation of acini within the mammary gland. Progesterone occurs also in the adrenal cortex and testis, and in some plants, e.g. *Hollathrena floribunda*. It is synthesized from **pregnenolone** by 3β -hydroxy- Δ^5 -steroid dehydrogenase, EC 1.1.1.145, and is an intermediate in the formation of androgens, estrogens, glucocorticoids, and mineralocorticoids.

progesterin 1 an alternative name for **progestogen**. **2** natural **progesterone**, especially in unpurified form.

progesterin receptor 1 a nuclear receptor of the steroid hormone type that binds and mediates the biological effects of progesterone. **2** a G-protein-coupled membrane protein that inhibits adenylate cyclase and mediates the effects of progesterone that are too rapid to be produced via transcription. The α isoform of animals occurs in reproductive tissues, while the β isoform occurs in brain.

progestogen or **progestagen** or **progesterin** any natural or synthetic compound with the hormonal activity of progesterone. In oral contraception regimes, a progestogen is normally combined with an estrogen. The effect is to inhibit ovulation. A preferred method is to use a gestagen, which acts by an effect on the endometrium; these have fewer side effects than progestogens.

proglucagon the prohormone of **glucagon** and **enteroglucagon**. In mammals it consists of ≈ 170 residues, which contain the entire 29-residue sequence of glucagon in the N-terminal region, and two glucagon-like peptides, designated GLP-1 and GLP-2, of 37 and 35 residues respectively, within the C-terminal region. The 69-residue N-terminal portion, containing the glucagon sequence, is identical with **glicentin**. Angler-fish proglucagon is similar but smaller, and exists in two forms: a 14 kDa form (lacking GLP-2 and a 13-residue connecting peptide) and a 12 kDa form (of unknown sequence).

program 1 a sequence of coded instructions for controlling a com-

puter or other electrical or electromechanical device, especially for enabling a computer to manipulate data in a predetermined way; an equivalent of this in an electronic or magnetic storage medium. **2** to constrain to function or operate in a particular way, especially by providing with a program or other (set of) instructions. **3** to write (and test) a computer program for a specific application. —**programmable** or *sometimes (esp. US) programmable adj.*

programmable messenger a term proposed for a cytosolic protein messenger molecule in a hypothesis advanced to explain the multiple actions on their target cells of hormones whose cellular receptors are linked to oligomeric GTP-regulatory proteins in cell membranes. According to this concept, the activation of GTP-regulatory proteins (by GTP and the respective hormones) causes release of their α subunits from the membranes as cytosolic proteins, which become the primary messengers of hormone action and which thereupon are transformed by various protein-modifying enzymes (e.g. kinases and proteases) to yield new structures with selective affinities for different effectors, each responsive to its specific activating system. A variety of responses of the target cells thus may be elicited: accordingly, these messengers are considered programmable.

programmed ribosomal frameshifting a mechanism whereby different proteins may result from a single mRNA molecule, due to the presence of alternative sites within the mRNA that are recognized for initiation and termination of translation.

programming language a technical language in which computer programs are written. Different languages have evolved for different applications. Low-level languages tell the computer directly what operations to execute (e.g. machine and assembly languages); higher-level languages are used for scientific computation, business data processing, computer science education, symbol processing, and systems processing (e.g. Fortran, Cobol, Pascal, Lisp, and C, respectively); high-level scripting languages include awk, javascript, perl, php, python, sh, and tcl; object-oriented programming languages facilitate modular software design, and include Visual Basic, Java, and C++.

progress curve a graph showing the change with time in the concentration or amount of an analyte as a chemical reaction proceeds.

progressive alignment see **multiple alignment program**.

prohibitin any member of a family of highly conserved integral membrane proteins of the inner mitochondrial membrane that modulate the action of m-AAA proteases. Prohibitins contain a domain that is also present in stomatin and flotillin.

prohormone a natural (poly)peptide or protein precursor of a hormone.

prohormone convertase or **prohormone converting enzyme** any member of a family of endopeptidases that cleave prohormones within **dibasic cleavage sites** to form active polypeptides. They reside in acidic secretory vesicles. The C-terminal basic residue that remains is then removed by a carboxypeptidase. As EC 3.4.23.17 its *recommended name* is proopiomelanocortin converting enzyme. See also **neuroendocrine convertase**.

prohormone converting enzyme another name for **prohormone convertase**.

proinsulin the prohormone of **insulin**; it is a single-chain polypeptide of ≈ 9 kDa with three intrachain disulfide bridges, the number of amino-acid residues varying somewhat with species (78 in dog, 81 in cattle and sheep, 84 in cod and pig, 86 in horse, human, and rat). It is cleaved into insulin and C (or connecting)-peptide. Synthesized in the pancreatic B cells, it is normally present at about 5% of the concentration of insulin, and is secreted in small amounts into the blood.

projection formula any two-dimensional diagrammatic representation of the (three-dimensional) structural formula of a molecule (or part thereof) as if seen by projection onto a plane surface from a particular viewpoint in space. Bonds with different spatial orientations relative to the observer may be depicted distinctively. The term includes **conformational formula**, **Fischer projection**, **Newman projection**, and **perspective formula**.

prokaryon or **procaryon** (*pl. prokarya* or *procarya*) a primitive nucleus; i.e. genomic DNA in a defined structure, but lacking a nu-

clear membrane or other nuclear inclusions. Such an arrangement is found in bacteria (including actinomycetes) and cyanobacteria. See also **nucleoid** (def. 2). —**prokaryous** or **procaryous adj.**; **prokaryosis** or **procaryosis n.**

prokaryosis the condition of possessing a prokaryon or procarya.

prokaryote or **procaryote** any organism in which the genomic DNA is not enclosed by a nuclear membrane within the cells; i.e. any organism whose cells possess a **prokaryon**. The prokaryotes comprise the bacteria, cyanobacteria, and archaea and are classified in their own kingdom, variously named Monera or Procaryotae. Compare **eukaryote**. —**prokaryotic** or **procaryotic adj.**

prolactin *abbr.*: PRL; a hormone secreted by the anterior pituitary that stimulates lactation. Human prolactin (hPRL) is a 199-residue protein, 23 kDa in its monomeric form (**little prolactin**), although dimeric (**big prolactin**, 48–56 kDa) and polymeric (>100 kDa) forms circulate in blood. The prolactin gene belongs to a family of genes, along with those encoding placental lactogen and human growth hormone (see **somatotropin**). Secretion is episodic; it is inhibited by dopamine, which binds to lactotrope D₂ receptor (see **dopamine receptor**) to inhibit adenylate cyclase, and is probably stimulated by **thyrotropin-releasing hormone** and **vasoactive intestinal peptide**. Prolactin synthesis is positively regulated by estrogen acting at the level of the prolactin gene. Receptors for prolactin are located in breast, liver, ovary, testis, and prostate, but its main site of action is the mammary gland, which is stimulated to develop by estrogen, progesterone, prolactin, and placental mammatropic hormones. Lactation is stimulated by prolactin but is prevented during pregnancy by the inhibitory action of estrogen and progesterone, the levels of which fall after parturition, allowing prolactin to initiate lactation. See also **prolactin receptor**, **proliferin**.

prolactin receptor a membrane protein of the cytokine receptor family. The prolactin receptor is associated with a small protein **calcyclin**.

prolamins or (*formerly*) **prolamines** any of a group of simple proline-rich proteins, found especially in the seeds of cereal plants, that are insoluble in water, neutral salt solutions, and absolute ethanol, but soluble in dilute acid or alkali, and in 70–80% aqueous ethanol. The group includes the **gliadins** of wheat and rye, **hordein** of barley, and **zein** of maize. Compare **glutelin**.

prolate 1 having a polar diameter longer than the equatorial diameter. **2** describing an **ellipsoid of rotation** generated by the rotation of an ellipse about its major axis. Compare **oblate**.

prolidase another name for **X-Pro dipeptidase**. Distinguish from **prolinase**.

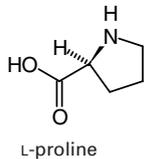

proliferating cell nuclear antigen see **PCNA**.

proliferin or **mitogen-regulated protein** a prolactin-related protein, the mRNA of which appears in several murine cell lines during growth. One of several proteins of the somatotropin/prolactin family that provide a growth stimulus to target cells in maternal and fetal tissues during the development of the embryo. The mRNA occurs in placenta, which secretes proliferin as a glycoprotein distinct from placental lactogen.

prolinase the *recommended name* for **Pro-X dipeptidase**. Distinguish from **prolidase**.

prolinate 1 proline anion; the anion, (C₄H₇NH)–COO[–], derived from **proline**. **2** any salt containing proline anion. **3** any ester of proline.

proline the *trivial name* for pyrrolidine-2-carboxylic acid, (C₄H₇NH)–COOH; a chiral cyclic *N*-alkylated α -amino acid. L-proline (*symbol*: P or Pro), (S)-pyrrolidine-2-carboxylic acid, is a coded amino acid found in peptide linkage in proteins; codon: CCA, CCC, CCG, or CCU; by virtue of its more constrained molecular structure relative to most other α -amino acids, it usually does not participate in α -helix formation in globular proteins, but does occur in transmembrane helices, in which it introduces a pronounced kink. In mammals, it is a non-essential dietary amino acid, and is glucogenic. It is formed from **glutamate 5-semialdehyde** by reduction by NADPH. D-Proline (*symbol*: D-Pro or DPro), (R)-pyrrolidine-2-carboxylic acid, is not known to occur naturally. See also **hydroxyproline**.

proline/arginine-rich protein *abbr.*: PARP; a 24 kDa proline- and arginine-rich protein from bovine cartilage, closely related to the N-terminal domain of collagen $\alpha 1$ (XI).

proline dehydrogenase EC 1.5.99.8; *other name*: proline oxidase; a flavoprotein enzyme that catalyses the reaction:

The flavin is FAD. In *Escherichia coli* the enzyme is bifunctional, having the activities of both proline dehydrogenase and **1-pyrroline-5-carboxylate dehydrogenase**. In humans, the enzyme (516 amino acids) is located with the inner mitochondrial membrane and is present in liver, kidney, and brain. Enzyme deficiency results in hyperprolinemia type 1.

proline dipeptidase *see* X-Pro dipeptidase.

proline hydroxylase *see* procollagen-proline dioxygenase.

proline-rich proteins *abbr.*: PRP; one of the four major classes of **plant cell-wall proteins**. They contain proline-rich repeat sequences (Pro-Pro-Val-Tyr-Lys in soybean), are poorly glycosylated, and are thought to form rodlike molecules.

prolinium proline cation; the cation, $(\text{C}_4\text{H}_7\text{NH}_2^+) \text{--COOH}$, derived from proline.

proline the pyrrolidino group, $\text{HOOC} \text{--}(\text{C}_4\text{H}_7\text{N}) \text{--}$, derived from proline.

prolixin-S *an alternative name for* nitrophorin 2.

prolyl the acyl group, $(\text{C}_4\text{H}_7\text{NH}) \text{--CO} \text{--}$, derived from proline.

prolyl dipeptidase *see* Pro-X dipeptidase.

L-polyglycine dipeptidase *see* Pro-X dipeptidase.

prolyl hydroxylase *see* procollagen-proline dioxygenase.

prolyl oligopeptidase EC 3.4.21.26; *other names*: prolyl endopeptidase; post-proline cleaving enzyme; post-proline endopeptidase. An enzyme that catalyses the hydrolysis of Pro-[Xaa >> Ala]-Xaa in oligopeptides. It is a cytoplasmic (in eukaryotes) serine endopeptidase, also found in some bacteria.

prometaphase the stage in **mitosis** or **meiosis**, following **prophase**, during which the nuclear envelope is disrupted and breaks into membrane vesicles, and the spindle microtubules enter the nuclear region. **Kinetochores** mature on each **centromere** and attach to some of the spindle microtubules; these are then called **kinetochore microtubules** while those to which kinetochores do not attach are called **polar microtubules**; microtubules outside the spindle are called **astral microtubules**. Kinetochore microtubules begin the process of aligning chromosomes in one plane halfway between the poles.

promiscuous DNA any DNA sequence that occurs in more than one of the genetic systems (i.e. nuclear, mitochondrial, or plastid) of eukaryotic cells. Many such DNA segments have been found in yeast, fungi, plants, and animals.

promoter *symbol*: P; a DNA sequence located 5' to a gene that indicates the site for the initiation of transcription. It may influence the amount of mRNA produced and the tissue specificity of expression. The symbol may be subscripted to indicate particular promoters, e.g. P_{RM} , a promoter for the *cI* gene, RM standing for repressor maintenance. In prokaryotes consensus sequences centred at -10 (i.e. **Pribnow box**) and -35 nucleotides upstream from the transcription start site are recognized by **RNA polymerase**. Eukaryotic promoters have sequence elements that are recognized by general transcription factors such as TFIIA, TFIIB, TFIIC, TFIID (i.e. **TATA-binding protein**), TFIIE, TFIIH, and TFIIJ that form a transcription initiation complex with RNA polymerase II. **TATA boxes** (-25), **CAAT boxes** (-100), and **GC boxes** are often found in the promoters of housekeeping genes. In addition, eukaryotic promoters may have binding sites (**response elements**) for transcription factors

found in only some cell types. Promoters for genes transcribed by RNA polymerase III may be downstream from the start site.

promoter escape or **promoter clearance** the melting of dsDNA downstream of the promoter region effected by a subunit of transcription factor TFIIF that is an ATPase and acts as a molecular wrench that twists the two strands apart.

promoter ligand an additional ligand that is included in the loading buffer in **affinity chromatography**, to promote specific binding to the immobilized ligand.

promoter melting the denaturation or separation of the two strands of DNA of the promoter region on binding a 3'→5' DNA helicase subunit of transcription factor TFIIF.

promutagen any substance that, when acted upon by the cell's metabolism, becomes a **mutagen**.

promyelocytic leukemia protein *see* PML.

promyelocytic leukemia zinc finger protein *see* PLZF.

Pronase a *proprietary name* for a mixture of various exo- and endopeptidases, obtained from *Streptomyces griseus*, that is able to hydrolyse virtually any protein almost completely to free amino acids. It is used for hydrolysis of many proteins, for digestion of mucins, in isolation of intact DNA or RNA from cells or viruses, and in dispersal of certain types of mammalian tissue cells, e.g. chondrocytes.

pronucleus (*pl.* pronuclei) the nucleus of either the ovum or the spermatozoon following fertilization. Thus, in the fertilized ovum, there are two pronuclei, one originating from the ovum, the other from the spermatozoon that brought about fertilization; they approach each other, but do not fuse until just before the first cleavage, when each pronucleus loses its membrane to release its contents. —**pronuclear adj.**

proof a standard by which the strength of distilled alcoholic solutions (or vinegars) is judged. In the UK it is the strength of a mixture of alcohol and water having a specific gravity of 0.91984, and containing 0.495 of its weight or 0.5727 of its volume of absolute alcohol. Degrees of proof express the percentage of proof spirit present; hence 70° proof spirit contains $0.7 \times 57.27\%$ alcohol. In the US, proof is a number that is twice the percentage (by volume) of alcohol present; hence 70° proof spirit contains $0.5 \times 70\%$ alcohol.

proofreading (*in genetics*) verification of the exact nature of a sequence of bases in DNA or amino-acid residues in a protein. Proofreading of DNA sequence occurs in transcription, during the action of DNA polymerase, when incorporation of an incorrect nucleotide causes mismatch in pairing with the complementary base on the template strand; this leads to immediate excision of the incorrect nucleotide, retreat of the enzyme to the previous position, and another attempt to insert the correct nucleotide. During translation, charging of the tRNA with its aminoacyl group is verified by its fit in the binding site; if incorrect, the aminoacyl-tRNA is hydrolysed to tRNA and amino acid and the whole process is repeated until successful. Examples of such proofreading during translation include rejection of threonine by valine-tRNA ligase, and of valine by isoleucine-tRNA ligase. *See also* mismatch repair.

Pro(3-OH) *symbol* for a residue of the α -amino acid (*trans*)-3-hydroxy-L-proline (alternative to 3Hyp).

Pro(4-OH) *symbol* for a residue of the α -amino acid (*trans*)-4-hydroxy-L-proline (alternative to 4Hyp).

proopimelanocortin *abbr.*: POMC; a 241-residue prohormone protein, also called **corticotropin-lipotropin precursor**, synthesized in the intermediate and anterior lobes of the pituitary. POMC is cleaved in the anterior pituitary by a **prohormone convertase**, PC1 to yield an N-terminal peptide (residues 1–80), **corticotropin** (residues 110–148) and β **lipotropin** (β -LPH, residues 148–241). The segment 83–107 is known as **joining peptide**. Prohormone convertase, PC2, then cleaves corticotropin to yield α -**melanocyte-stimulating hormone** (α -MSH; residues 110–122), and cleaves β -LPH to yield γ -LPH (residues 151–208) and β **endorphin** (residues 211–241). Derived hormones (cleavage points and some sizes differ from porcine above): corticotropin, 39 amino acids; **corticotropin-like intermediate lobe peptide**, 21 amino acids; β endorphin, 31 amino acids; lipotropins β -LPH (89 amino acids) and γ -LPH (56 amino acids); melanocyte-stimulating hormones α -MSH (13 amino acids), β -MSH (18 amino acids), and γ -MSH (11 amino acids); [Met]enkephalin (*see* **enkephalin**), 5 amino acids. In the intermediate lobe, POMC synthe-

sis is regulated mainly by dopamine and serotonin; in the anterior lobe by glucocorticoids and corticotropin-releasing hormone. The prohormone convertases are related to **furin** and **kexin**.

proopiomelanocortin converting enzyme EC 3.4.23.17; *the recommended name for* **prohormone convertase**.

propargylamine *see* **monoamine oxidase inhibitors**.

propellant or **propellent** any substance that through pressure or combustion or other means causes propulsion, as, e.g., the use of compressed gases in spray cans.

propeptide that part of a peptide chain that follows the signal sequence, and is cleaved off in formation of the mature protein.

properdin *see* **complement**.

prophage a form of the genome of a bacteriophage in which the nucleic acid is integrated into the genome of the phage's bacterial host, a state known as **lysogeny**. **Induction** to produce mature phage can occur, with accompanying lysis of the bacterium. For example, in **lambda phage**, transcription of the prophage is repressed by the *cI* gene product, the repressor, which binds to the *O_L* and *O_R* operators thereby preventing use of the *P_L* and *P_R* promoters. The product of the *cII* gene, CII, is crucial in determining the choice between lysogeny and lysis; if CII is active lysogeny is favoured, but if CII is not active (due to breakdown by host proteases) lysis is favoured.

prophage induction *see* **phage induction**.

prophage-mediated conversion *another name for* **bacteriophage conversion**.

prophage reactivation the phenomenon in which the survival of UV-irradiated **lambda phage** is higher in a host carrying a homologous heteroimmune prophage than in a host that is nonlysogenic or is lysogenic with a nonhomologous prophage.

prophase the initial stage of **mitosis** or **meiosis** in which the chromosomes are condensed, becoming apparent within the nucleus, but are not yet attached to a mitotic spindle. By early prophase, the single centrosome contains two centriole pairs; at late prophase, the centrosome divides and the two asters move apart. In meiosis, the chromosomes come together in homologous pairs, and undergo crossing-over. This occurs during the first of the two meiotic cell divisions, and is divided into several stages. In the first, zygote, a complex structure develops between the two sister chromatids of each pair, which may play a part in **recombination**. They remain in the complex during a stage known as pachytene, then separate at the diplotene stage.

propheromone convertase Y a protease present in yeast with specificity towards paired basic residues (-Lys-Arg-, -Arg-Arg-, or -Arg-Lys-) and no activity towards single basic residues.

propanil iodide a phenanthridine derivative (λ_{max} excitation 536 nm, emission 617 nm) whose fluorescence intensity increases greatly when intercalated in the DNA double helix. It is widely used in flow cytometry in the analysis of ploidy.

propionate the anion, $\text{CH}_3\text{-CH}_2\text{-COO}^-$, derived from propionic acid, in any salt; designation for the **propionyl** radical in naming an ester.

propionibacteria bacteria belonging to the genus *Propionibacterium*. They are characterized by their activity in fermenting glucose or lactic acid to propionic acid; acetic acid is also a major product. *See also* **propionic-acid fermentation**.

propionic acid propanoic acid; $\text{CH}_3\text{-CH}_2\text{-COOH}$; a carboxylic acid, important in the energy metabolism of ruminants, in which it is formed by rumen bacteria. It is the basis of a series of nonsteroidal anti-inflammatory agents, known as substituted propionic acids; *see* **ibuprofen**.

propionic-acid fermentation fermentation of glucose or lactate by *Propionibacterium* spp. (*see* **propionibacteria**) to either propionate or acetate; pyruvate is a common intermediate for both transformations. In propionate formation, pyruvate first reacts with methylmalonyl-CoA to form propionyl-CoA and oxaloacetate. The latter is converted by reactions of the tricarboxylic-acid cycle to succinate, which then reacts with the propionyl-CoA to form propionate and succinyl-CoA. The succinyl-CoA is converted to methylmalonyl-CoA, which is then available to react with a further molecule of pyruvate. Conversion of pyruvate to acetic acid involves oxidative decarboxylation to acetyl-CoA, reaction of this with orthophosphate to form acetyl phosphate, and reaction of the latter

with ADP to form ATP and acetic acid. When lactate is the initial substrate, this is first converted to pyruvate by lactate dehydrogenase. This enzyme is a flavoprotein, that is oxidized by a cytochrome *b*.

propionyl *symbol:* Pp; *the trivial name for* propanoyl, $\text{CH}_3\text{-CH}_2\text{-CO-}$, the univalent acyl group derived from propionic (i.e. propanoic) acid. *Compare* **propyl**.

propionyl-CoA carboxylase *abbr.:* PCCase; EC 6.4.1.3; an enzyme that catalyses a reaction between ATP, propanoyl-CoA, and HCO_3^- to form (S)-methylmalonyl-CoA, ADP, and orthophosphate; biotin is a coenzyme. It is an enzyme in the catabolic pathways of odd-chain fatty acids and isoleucine, occurring in the mitochondrial matrix. Defects cause propionic acidemia, which is inherited as a recessive trait. The human enzyme consists of six α chains (biotin binding) and six β chains.

proplastid the precursor of a **plastid**.

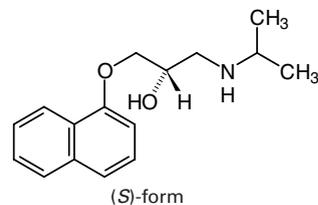

propolypeptide the inactive form in which some polypeptide hormones, or other agonists, are produced; it is activated by removal of part of the sequence by a protease.

proportional counter any device for measuring radioactive disintegrations by means of a gas-filled ionization chamber, e.g. Geiger counter, operating in the **proportional region**.

proportional region a range of voltages applied to a gas-filled ionization chamber (e.g. Geiger counter) over which the gas amplification is greater than unity. In radioactive counters of this type, measurement depends on ionization of the gas in the ionization chamber by emitted radiation. Up to a certain applied voltage, ion production and thus the current through the chamber depends solely on collisions between emitted radiation and gas molecules; at higher voltages, the current is enhanced by additional collisions, so that sensitivity is increased, but the current remains proportional (hence the name proportional region) to the rate of emission of radiation. *Compare* **Geiger region**.

propositus or (*fem.*) **proposita** (*pl.* **propositi**) or **proband** the first individual to present as a patient, in a series of cases related (usually) to a heritable disorder, and from whom the line of descent is traced.

propranolol an important β -adrenoceptor antagonist; the (S) form is the active structure. It is used therapeutically as an antihypertensive, anti-anginal, and anti-arrhythmic. *One proprietary name:* Inderal (as hydrochloride).

propressophysin the polypeptide precursor of **vasopressin** and **neurophysin** (*see* **vasopressin-neurophysin 2-copeptin precursor**). Mutation of the gene is associated with familial neurogenic diabetes insipidus.

proprotein an inactive form of a protein, having an additional sequence that is removed by a protease to yield the active protein; a classic example is **proinsulin**. A **zymogen** is a form of proprotein, sometimes referred to as a proenzyme.

propyl *symbol:* Pr; *n*-propyl; the alkyl group, $\text{CH}_3\text{-CH}_2\text{-CH}_2\text{-}$, derived from propane. *Compare* **isopropyl**, **propionyl**.

pro-R/pro-S convention stereochemical descriptors for paired, chemically-like ligands at a prochiral centre; they derive from an extension of the **sequence rule** used to assign *R,S* descriptors to a chiral centre. In the prochiral (but achiral) structure, *Caabc*, the chemically-like ligands are the two atoms (or groups of atoms), *a*. For the sake of example assume that the sequence rule gives the priority sequence, $a > b > c$. In the molecular model (or projection formula) arbitrarily label the *a* groups as *a'* and *a''* and arbitrarily assign higher priority to one of them, e.g., $a' > a''$. The modified priority sequence, $a' > a'' > b > c$, is then considered with the model viewed from the side remote from *c*. If this gives a right-handed ordering

for $d' \rightarrow d'' \rightarrow b$, thus leading to R chirality for the arbitrarily created chiral element, the promoted d' is designated the *pro-R* group; conversely, if the arbitrarily created chiral element reveals an S ordering, the promoted group is *pro-S*. Example: glycerol, HOCH₂-CHOH-CH₂OH, contains two chemically-like CH₂OH groups, and the normal priority sequence is OH > CH₂OH > H. In the **Fischer projection** formula with the central carbon atom having the OH group to the right and H to the left, arbitrarily assign the top C'H₂OH group priority over that at the bottom, C''H₂OH, giving the modified sequence, OH > C'H₂OH (top) > C''H₂OH (bottom) > H. When the model is viewed from the side remote from the lowest priority atom (H) the ordering, OH \rightarrow C'H₂OH (top) \rightarrow CH₂OH (bottom) is right-handed so that the arbitrarily created chiral element has R chirality; hence the top C'H₂OH is the *pro-R* group. Subscript letters R and S can be used to indicate whether an atom or group of atoms is *pro-R* or *pro-S*. This is most commonly done for the two hydrogens of a methylene group, with H_R indicating the *pro-R* hydrogen and H_S the *pro-S* hydrogen. For a methylene group, replacement of ¹H_R by ²H or ³H gives a centre with R chirality; similar replacement of ¹H_S gives a centre with S chirality. See also **enantiotopic**.

pros a designator of position of a nitrogen in the histidine imidazole ring, being that nitrogen nearest to the side chain; often abbreviated to π , as in N $^\pi$. Compare **tele**.

prosaposin the polyprotein precursor (524 amino acids) of the **saposins**. A mutation in the translation initiation codon leads to a very rare prosaposin deficiency (and thus deficiency of all saposins), which is rapidly fatal in infancy.

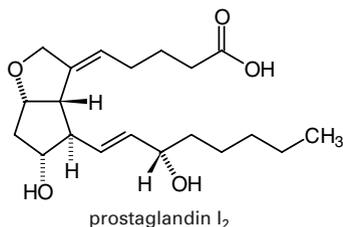

PROSITE see **pattern database**.

prosolin see **stathmin**.

prosome another name for **proteasome**.

Prospero a transcription factor localized in the basal cortical crescent of *Drosophila* neuroblasts that enters the nucleus after cell division to activate ganglion mother cell genes, repress neuroblast-specific genes, and cause differentiation into neurons.

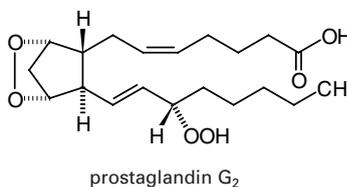

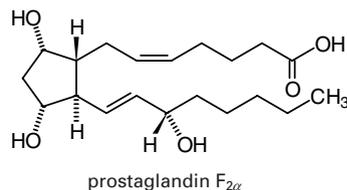

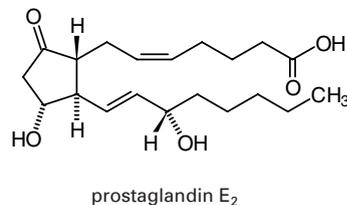

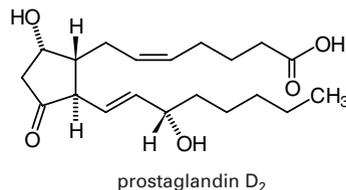

prostacyclin or **prostaglandin I** (*abbr.*: PGI) any of a group of prostanoids synthesized by **prostaglandin-I synthase** (EC 5.3.99.4) from prostaglandin H – which itself is the product of **prostaglandin-endoperoxide synthase** – as prostaglandin I₂, I₁, or I₃, depending on whether the substrate for the enzyme is arachidonate, dihomo-(6,9,12)-linolenate, or eicosa-5,8,11,14,17-pentaenoate respectively. PGI₂ is the major product *in vivo*; it is produced by endothelial cells of blood-vessel walls, has potent platelet anti-aggregatory properties resulting from stimulation of adenylate cyclase, and induces vasodilation. It has a normal half-life of 2 min, being degraded by hydrolysis to 6-oxo-prostaglandin F_{1 α} ; this is then converted to the 6,15-dioxo-13,14-dihydro-PGF_{1 α} , and follows a similar degradative path to other prostaglandins. More stable but still active analogues have been synthesized, e.g. carbacyclin. (*S*)-15-hydroperoxyeicosatetraenoate inhibits prostaglandin-I synthase. See also **prostaglandin**.

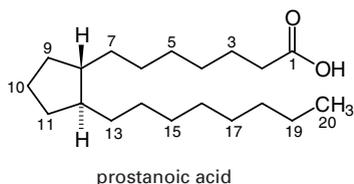

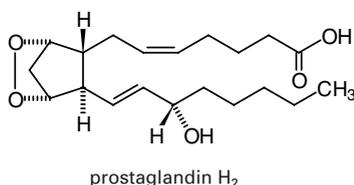

prostacyclin synthase see **prostaglandin-I synthase**.

prostaglandin *abbr.*: PG; any of a group of biologically active metabolites of arachidonate (PG₂ series), dihomo- γ -linolenate (PG₁ series), or eicosa-5,8,11,14,17-pentaenoate (PG₃ series). They characteristically contain a cyclopentane ring due to formation of a bond between C-18 and C-12 of the fatty acid; hydroxy or oxo substitution at positions 9 and 11 is a major distinguishing feature between prostaglandin classes. They possess a protean array of highly

potent biological activities that defy simplification. Their pharmacological effects include: vasodilation (PGE₂ and **prostacyclin**) which is short-acting, and vasoconstriction (PGF_{2 α} and **thromboxane A₂**); oxytocic activity (PGF_{2 α} can be used to terminate pregnancy in the second trimester and PGE₂ induces labour at term); bronchodilation (PGE series) and constriction (PGF series). They are involved in inflammatory reactions, and the enzymes that synthesize them are targets for antiinflammatory agents such as aspirin and non-steroidal antiinflammatory drugs such as ibuprofen. They are also involved in the regulation of cell proliferation in normal and neoplastically transformed cells. Prostaglandins are formed from the precursors prostaglandin G₁, G₂, or G₃, the intermediate products of **prostaglandin-endoperoxide synthase**, depending on the substrate fatty acid; the same enzyme converts these to prostaglandins H, from which other enzymes form prostaglandins D, E, and F, and also **prostacyclins** (or prostaglandins I). These are the bioactive products of the system, but they have a half-life of minutes, being rapidly converted to metabolites with much weaker, or often inhibitory properties. The initial metabolites are the 15-oxo-13,14-dihydroprostaglandins, produced by the sequential actions of 15-hydroxyprostaglandin dehydrogenases (e.g. EC 1.1.1.196 and 1.1.1.197) and 15-oxoprostaglandin 13-reductase (EC 1.3.1.48); these are further degraded by beta oxidation and omega oxidation to urinary metabolites such as 7 α -hydroxy-5,11-dioxotetranorpropane-1,16-dioate (from PGE₂) and 5,7-dihydroxy-11-oxotetranorpropane-1,16-dioate. The structures of prostanic acid, with its carbon numbering, and of PGG₂, PGH₂, PGD₂, PGE₂ and PGF_{2 α} are shown.

prostaglandin-D synthase *abbr.*: PGD synthase; EC 5.3.99.2; *other name*: prostaglandin-H₂ D-isomerase; an enzyme that catalyses the conversion of (5*Z*,13*E*)-(15*S*)-9 α ,11 α -epidioxy-15-hydroxyprosta-5,13-dienoate to (5*Z*,13*E*)-(15*S*)-9 α ,15-dihydroxy-11-oxoprosta-5,13-dienoate (prostaglandin D). Glutathione is a cofactor in some cases.

prostaglandin-endoperoxide synthase EC 1.14.99.1; *other names*: prostaglandin synthase; prostaglandin G/H synthase. An enzyme whose reaction embraces the activity formerly called **cyclooxygenase**; it catalyses a reaction between dioxygen, arachidonate and two molecules of reduced glutathione (GSH) to form prostaglandin H₂, oxidized glutathione (GSSG), and H₂O. The enzyme acts as both a dioxygenase and as a peroxidase. It catalyses the formation of the precursor, prostaglandin G₂ (PGG₂), for the biosynthesis of all prostanoid compounds, by forming an endoperoxide bridge between C-9 and C-11, simultaneously bonding C-8 and C-12 to form the cyclopentane ring, and also forming the hydroperoxide at C-15. The latter is reduced by a reduced glutathione (GSH)-dependent peroxidase activity of the enzyme to a hydroxyl group to form prostaglandin H₂; these, and their further metabolites, prostaglandins D, E and F, are highly potent bioactive compounds with a great diversity of actions (*see prostaglandin*). The enzyme can also act on dihomo-(6,9,12)-linolenic acid, to form a series of prostaglandins (denoted by a subscript 1, e.g. PGE₁) lacking the C-5 double bond, and on eicosa-5,8,11,14,17-pentaenoic acid, to form the 3 series of prostaglandins (e.g. PGE₃), with the additional double bond at C-17. Two isoenzymes, COX-1, constitutively expressed, and COX-2, inducible in inflammation by cytokines, are highly homologous membrane proteins, but selective inhibition of COX-2 is possible due to its larger inhibitor-binding site. Aspirin acetylates an active-site serine residue in both, the IC₅₀ being 10 to 100 times lower for COX-1 than for COX-2. Its inhibition of COX-1 is the basis of its antithrombotic effects. *See also prostacyclin, thromboxane.*

prostaglandin-E₂ 9-reductase EC 1.1.1.189; an enzyme that catalyses the reduction by NADPH of (5*Z*,13*E*)-(15*S*)-11 α ,15-dihydroxy-9-oxoprosta-5,13-dienoate (PGE₂) to (5*Z*,13*E*)-(15*S*)-9 α ,11 α ,15-trihydroxyprosta-5,13-dienoate (PGF_{2 α}) with formation of NADP⁺. The monomeric cytoplasmic human enzyme catalyses reduction of many carbonyl compounds. In addition to the activity of prostaglandin-E₂ 9-reductase (also termed prostaglandin 9-ketoreductase), it also contains two other activities: carbonyl reductase (NADPH) EC 1.1.1.184, and 15-hydroxyprostaglandin dehydrogenase (NADP⁺), EC 1.1.1.197.

prostaglandin-E synthase EC 5.3.99.3; *other names*: prostaglandin-H₂ E-isomerase; endoperoxide isomerase; an enzyme that catalyses the conversion of (5*Z*,13*E*)-(15*S*)-9 α ,11 α -epidioxy-15-hydroxyprosta-5,13-dienoate to (5*Z*,13*E*)-(15*S*)-11 α ,15-dihydroxy-9-oxoprosta-5,13-dienoate (PGE₂). Glutathione is a cofactor.

prostaglandin-F synthase EC 1.1.1.188; *other name*: prostaglandin-D₂ 11-reductase; an enzyme that catalyses the formation of (5*Z*,13*E*)-(15*S*)-9 α ,11 α ,15-trihydroxyprosta-5,13-dienoate and NADP⁺ from (5*Z*,13*E*)-(15*S*)-9 α ,15-dihydroxy-11-oxoprosta-5,13-dienoate and NADPH.

prostaglandin-I synthase EC 5.3.99.4; *other name*: prostacyclin synthase; an enzyme that catalyses the conversion of (5*Z*,13*E*)-(15*S*)-9 α ,11 α -epidioxy-15-hydroxyprosta-5,13-dienoate to (5*Z*,13*E*)-(15*S*)-6,9 α -epoxy-11 α ,15-dihydroxyprosta-5,13-dienoate (PGI₂, prostacyclin). This is a heme-thiolate protein.

prostanate the anion of prostanic acid, 2-octylcyclopentaneheptanoic acid; the 8*S*,12*S* form is the parent compound for prostanoid nomenclature. For structure, *see prostaglandin*.

prostanoid any compound based on or derived from the **prostanate** structure, including the **prostaglandins**, **prostacyclins**, and **thromboxanes**.

prostasin a serine protease with trypsin-like activity, found in human seminal fluid.

prostate-specific antigen *abbr.*: PSA; a serine endopeptidase belonging to the family of glandular **kallikreins** with a His-Asp-Ser charge-relay system. It is virtually prostate specific. Levels may be elevated in prostate hypertrophy but the release from prostate cancer is higher than from normal tissue. It is a much better marker than **acid phosphatase**, being elevated at an earlier stage of the tumour. Its physiological substrate is the predominant protein of the seminal vesicle coagulum.

prostatic of, pertaining to, or related to the prostate gland.

prosthetic group a non-protein group that is combined specifically with a protein, in stoichiometric proportion.

prostin a prostatic serine endopeptidase that is not related to the kallikreins. *Compare prostate-specific antigen.*

protachykinin β precursor a preproprotein from which certain polypeptide hormones are cleaved, not all by the same processing pathway. For example, from the human precursor, the derived peptides are **substance P**, **neurokinin A**, and **neuropeptide K**. *See also tachykinin.*

protamine any of a group of small peptides, containing arginine, alanine, and serine, that are isolated from the sperm of fish (e.g., salmon, herring, sturgeon, trout, and mackerel), but are present in the sperm of all animals. They have a histone-like function in the chromatin of sperm, compacting sperm DNA into a condensed complex.

protamine sulfate a sulfated derivative of a **protamine**. Protamine sulfates combine with, and inactivate, **heparin**, and are used to prevent bleeding in heparin overdose.

protease any enzyme that catalyses the hydrolysis of peptide bonds in a protein or polypeptide. The specific names **endopeptidase**, **aminopeptidase**, and **carboxypeptidase** are recommended. *See also proteinase.*

protease-activated G-protein-coupled receptor *see PAR.*

protease inhibitor 4 *see kallistatin.*

protease nexin I *see nexin 1.*

proteasome or **proteasome** EC 3.4.99.46 *recommended name*: multicatalytic endopeptidase complex; *other names*: multicatalytic proteinase (complex); ingensin; macropain; prosome; lens neutral proteinase. Proteasomes are large multi-subunit protease complexes that selectively degrade intracellular proteins that are tagged for destruction by ubiquitination. They control cellular processes, such as metabolism and the cell cycle, through signal-mediated proteolysis of key enzymes and regulatory proteins. They also operate in the stress response, by removing abnormal proteins, and in the immune response, by generating antigenic peptides. The proteolytic activity is due to a 26S protease (a 2 MDa complex), whose ability to degrade proteins generally depends on both the ubiquitination of the substrate and the presence of ATP. At the core is a 20S particle that carries the catalytic activity. When first isolated, it was called 'multicatalytic proteinase' because of its ability to cleave peptide bonds carboxy-terminal to basic, hydrophobic, and acidic residues. The 20S particle does not require ATP for activity. The crystal structure of this core from the archaea *Thermoplasma acidophilum* has been

determined. The core alone is inactive because it requires two specific subunits of a 19S particle to mediate recognition of ubiquitin-protein conjugates. The core subunits are arranged in four heptameric rings, stacked to form a hollow cylinder with the protease activity on the inside. The active site nucleophile is threonine. The protein substrate first must be unfolded and the disulfide bonds reduced before entry into the cylinder. In *Thermoplasma*, the two outer rings are composed of seven α subunits, and each inner ring contains seven β subunits. The enzyme catalyses the cleavage at Xaa-| bonds in which Xaa carries a hydrophobic, basic, or acidic side chain. Components of the human proteasome include: c2, c3, c5, c7, c8, c9, β chain, c13, δ chain, ϵ chain, mecl-1, τ chain, and ζ chain.

protectin *see* CD59.

protecting group or **protective group** or **blocking group** any chemical group added to a reactive centre of a molecule to prevent it from reacting during chemical treatments in which it is not intended to participate. Such groups are commonly used during chemical synthesis of macromolecules or shorter polymers of amino acids or nucleotides. Reagents contributing protecting groups should react readily under mild conditions, with high specificity, and lead to addition of a group that can be removed highly specifically under mild conditions. For protein or amino-acid protecting groups *see* **aminoethyl**, **Boc**, **citraconylation**, **DABITC**, **dabsyl**, **dansyl**, **Fmoc**, **maleylation**, **pipsyl**, **silylation**, **succinylation**, **Tosyl**, **triphenylmethyl group**.

protection of telomeres-1 *see* Pot-1.

protective protein/cathepsin C *abbr.*: PPCA; a lysosomal multifunctional protein that has separate protective properties (for lysosomal β -galactosidase and neuraminidase) and catalytic properties (being a serine protease). The gene at 20q13.1 encodes a glycoprotein of 480 residues, which is processed to form a 32 kDa polypeptide joined by a disulfide bridge to another of 20 kDa. A serine on the heavy chain, and a histidine and an aspartate on the light chain constitute the catalytic triad. It is active as cathepsin A at acid pH, and as an amidase (e.g. for substance P, endothelin I, and neurokinin) and an esterase at neutral pH. At least a dozen point mutations in the gene are known to cause **galactosialidosis**, in which there is a triple enzyme deficiency.

protegrin *abbr.*: PG; any of a group of leukocyte antimicrobial peptides, denoted PG-1 to PG-5, that are active against *Escherichia coli*, *Listeria monocytogenes*, and *Candida albicans in vitro*. Like **tachyplesins**, they contain two intramolecular cystine disulfide bonds, and share similarity with **defensins**.

protein any of a large group of organic compounds found as major macromolecular constituents of living organisms. All enzymes are proteins, although catalytic activity is shown by some nucleic-acid molecules (*see* **ribozyme**). A protein is a linear polymer of **amino acids** linked by peptide bonds in a specific sequence. In the biosynthesis of the polypeptide chain, any of 20 different amino acids may be incorporated, according to the genetic instructions of the cell (*see* **protein and peptide biosynthesis**). The amino-acid residues may subsequently be modified so that the chains may contain a much wider variety of residues, amounting to nearly 200. The modifications may involve the covalent attachment of various groups, such as carbohydrates and phosphate; these are the simple proteins. Other substances may be more loosely associated with the polypeptide chains, such as heme or lipid, giving rise to **conjugated proteins**. Four hierarchies of structure have been defined for polypeptide chains, termed **primary structure**, **secondary structure**, **tertiary structure**, and **quaternary structure**. Four classes of protein have been recognized, which differ according to their content of **alpha helices** and **beta sheets**: all-alpha; all-beta; alpha/beta; and alpha + beta. Some important protein types are listed separately in this dictionary, and many others are listed individually: e.g., contractile proteins (**actin**, **myosin**, **tropomyosin**, **tubulin**), **heat-shock proteins**, **hemoproteins** (**cytochromes**, **hemoglobin**, **myoglobin**), **lipoproteins**, **membrane proteins** (**ATPases**, **ion channels**, **rhodopsin**), non-heme proteins (**blood coagulation factors**, **serum albumin**, **serum globulin**), nuclear proteins (**histones**), **plasma proteins**, and structural proteins (**collagen**, **crystallin**, **keratin**). Nutritional aspects of protein metabolism include the fact that higher animals cannot synthesize certain of the amino acids required for protein synthesis; these are referred to as **essen-**

tial amino acids. Plants and most microorganisms can synthesize all of the amino acids required for protein synthesis, and many others. The nutritional value of different proteins depends on their composition. Some proteins are of poor nutritional value, owing to lack of essential amino acids, e.g. gliadin, which lacks lysine, and zein, which lacks lysine and tryptophan. —**proteinaceous adj.**

14-3-3 protein any of a highly conserved family of proteins, widespread in higher eukaryotes, that seem to act as regulators in signal transduction or phosphorylation. The name derives from the migration position on DEAE-cellulose columns, and on starch-gel electrophoresis, of certain brain proteins that were the first members of the family to be studied. Members of this family have been implicated in regulation of **protein kinase C**, transcriptional regulation in plants, exocytosis, cell-cycle regulation, and interaction with **Raf** in the **MAP kinase** cascade. For example, 14-3-3 protein β (*other name*: protein kinase C inhibitor protein-1) from sheep activates tyrosine and tryptophan hydroxylases in the presence of Ca^{2+} /calmodulin-dependent protein kinase II. The bovine equivalent has an identical sequence: it is a homodimer.

protein A a bacterial cell-wall protein, found in many strains of *Staphylococcus aureus*, that can bind, without masking the antigen-binding site, to the Fc region of IgG. It binds weakly to human IgA, IgE, and IgM, but fails to bind to human IgG₃ and IgD; it does not bind to cell Fc receptors. The purified protein, or a preparation of cells of *S. aureus* that carry protein A, is widely used as an immunological reagent, often in an immobilized form on affinity columns, for isolation and purification of immunoglobulins and, by forming ternary complexes, of antigens and immune complexes. It is also used as a binding reagent in enzyme-linked immunoassay, in histochemistry, and in blotting techniques.

protein and peptide biosynthesis the biochemical synthesis of proteins. The synthesis of most peptides in living cells depends on the presence of **ribosomes**. This includes the small peptide hormones, such as **oxytocin** and **vasopressin**, which are synthesized as precursor proteins. Other peptides are not synthesized by means of ribosomes. Thus **glutathione** is synthesized by soluble enzymes in two steps. Many biologically active peptides, especially cyclic structures, are products of microorganisms. These include such antibiotic peptides as **gramicidin S**, the **tyrocidines**, and the **polymyxins**, which are synthesized by interacting multienzymes in which activated aminoacyl groups are transferred onto -SH groups to form intermediate thioesters. The multienzymes are unusual in size, ranging from 120 to 1700 kDa. They consist of repeating modules, each responsible for the incorporation of one amino-acid residue. The genes are arranged in clusters associated with genes encoding auxiliary proteins for the synthesis of precursors, modifying enzymes, exporting proteins, and regulatory systems. In addition to the amino acids and ATP, *S*-adenosylmethionine is required as methyl group donor if *N*-methylated bonds are involved. Due to their complexity (cyclosporin synthase for example, integrates 40 reactions on one polypeptide chain), the multienzyme systems have low turnover numbers. Cell-free systems for the production of various peptides and their analogues have been developed.

For synthesis involving ribosomes the first step is the activation of the amino acids to form amino-acid **adenylates**. The amino acids then become attached by an ester linkage to **transfer RNA** (tRNA). The template is **messenger RNA** (mRNA), which associates with the ribosomes themselves. The **translation** of the triplet codons in mRNA to provide a polypeptide involves three steps: chain initiation, chain elongation (*see* **elongation factor**), and chain termination (*see* **release factor**). Chain initiation normally starts with the codon for methionine, **AUG**, and involves a unique initiator tRNA. Many protein factors play a part in the three processes and five molecules of ATP and GTP participate. The ribosomes participate in a cycle during which they subdivide into their two subunits only to reassemble. Hence the synthesis of a peptide bond is a surprisingly expensive process in terms of energy. The targeting of the newly synthesized proteins to their final destination is termed **protein kinesis**. The mechanism of ribosomal protein synthesis is very similar in all types of cell but there are subtle differences in the number and properties of the soluble factors, particularly concerning

chain initiation: in prokaryotes this is by way of formylmethionine while in eukaryotes, apart from mitochondria, this involves methionine.

proteinase an enzyme that catalyses the hydrolysis of peptide bonds more readily in an intact protein than in small peptides. **Endopeptidase** is now recommended.

proteinase K EC 3.4.21.64; *recommended name*: endopeptidase K; *other name*: *Tritirachium* alkaline proteinase. A serine proteinase enzyme that catalyses the hydrolysis of keratin, and of other proteins with subtilisin-like specificity.

protein A-Sepharose an affinity chromatography medium for the purification or precipitation of immunoglobulins made by covalent coupling of **protein A** to agarose beads.

proteinase V8 *see* glutamyl endopeptidase.

protein B a cell-surface protein of group B *Streptococcus* species that binds specifically to the Fc region of human IgA, without affecting its antigen-binding capacity, but not to other immunoglobulins or serum proteins. It is used in enzyme-linked immunoassay and blotting techniques.

protein biosynthesis *see* protein and peptide biosynthesis.

protein body a membrane-delimited aggregate of prolamins that accumulates within regions of the endoplasmic reticulum in the endosperm of cereals (barley, maize, oats, wheat, etc.). The membrane surface often contains trapped polysomes as a result of the nascent prolamins aggregating with those already stored. *Compare* **protein storage vacuole**.

protein-bound iodine *abbr.*: PBI; that fraction of iodinated molecules bound to protein in serum. It is due largely to thyroxine (T_4), 99.97% of which in human serum is present bound to the binding proteins T_4 -binding globulin, T_4 -binding prealbumin and albumin, but also to T_3 , 99.7% of which is bound to the same proteins. Determination of PBI (now replaced by immunoassay) was used for estimation of blood thyroid hormones as a basis for assessment of thyroid function.

protein C a vitamin K-dependent glycoprotein that is the **zymogen** of a serine endopeptidase in normal blood plasma; M_r 62 000 (human), 54 300 (bovine). It is formed from a precursor, autoproteolytic IIa, which is cleaved into a light chain and a heavy chain, held together by a disulfide bond to form protein C. Thrombin cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin; protein C then becomes the enzyme protein C (activated), EC 3.4.21.69. This activated form specifically hydrolyses factors Va and VIIIa to inactive forms (in a reaction requiring phospholipid, calcium, and **protein S**), thereby acting as a potent anticoagulation factor; it contains 10–12 γ -carboxyglutamyl residues in the N-terminal 40 residues. A congenital deficiency of protein C (usually autosomal dominant) is often not compatible with survival, or leads to hemorrhagic disease of the newborn. Protein C is so named because it eluted from columns as the third of four peaks labelled A, B, C and D.

protein C23 *see* nucleolin.

protein C-binding protein *see* apolipoprotein H.

protein degradation the hydrolytic catabolism of proteins that occurs in the intestinal tract during digestion or intracellularly as part of regular turnover or apoptosis. Eukaryotic cells contain several proteolytic systems. The **vacuolar pathway** involves **endosomes** and **lysosomes** for the breakdown of extracellular proteins that enter cells by endocytosis. Lysosomes also degrade membrane proteins and proteins with long half-lives. In well-nourished organisms the lysosomes are nonselective but in some organs (e.g. liver and kidney) after prolonged fasting they are selective for cytosolic proteins that contain the pentapeptide sequence -KFERQ- or a related one. The **cytosolic system** is largely ubiquitin- and ATP-dependent and is mediated by **proteasomes**. Cytosolic **procaspases** are activated early during apoptosis. **Calpains** are also cytosolic. In the lumen of the endoplasmic reticulum, misfolded or unfolded proteins are degraded by proteases that function at high Ca^{2+} concentrations. Bacteria, mitochondria, and chloroplasts contain **AAA proteases** that degrade nonintegrated membrane proteins. *See* **PETS hypothesis**; **N-end rule**.

protein disulfide-isomerase *abbr.*: PDI; EC 5.3.4.1; *other name*: disulfide rearrangase; an enzyme that enhances the rate of inter-

change in the groups attached to two or more intrachain or interchain disulfide bonds in a protein. First described by Anfinsen in 1966 in connection with the reversible denaturation of ribonuclease and called 'rearrangase', it is a homodimer of the endoplasmic reticulum lumen and contains two domains homologous to **thioredoxin** of *Escherichia coli*. It is also the triacylglycerol transfer protein (MTP) that facilitates the incorporation of lipids into newly synthesized core **lipoproteins** within the endoplasmic reticulum. It serves as the β subunit of **procollagen-proline dioxygenase**.

protein engineering the process whereby a protein of any desired primary structure can (in principle) be created by the use of recombinant DNA technology. The ability to express DNA in a bacterium such as *Escherichia coli* creates the potential to synthesize a protein with the desired primary structure. Bacteria cannot effect post-translational modifications so if these also are required a eukaryotic host cell such as yeast must be employed. In principle there are no problems with the proteins of bacterial cells but **introns** present in the genome of eukaryotic cells present a potential problem. This can be overcome by preparing complementary DNA, **cDNA**, which is synthesized by the use of the mRNA as template and the enzyme **reverse transcriptase**. There are several ways whereby the DNA for the required protein may be prepared by modification of the base sequence of the natural DNA. DNA may be used that contains inserts of synthetic oligonucleotides, or stretches replaced by these. Oligonucleotide-directed mutagenesis may be used to modify a single base to produce a protein with a single amino-acid replacement. This is done by preparing an oligonucleotide primer with the modified sequence which will base pair with the natural DNA around the site to be altered; a single base substitution still permits satisfactory pairing. The primer is elongated by DNA polymerase and the double-stranded circle closed by **DNA ligase**. A specific deletion can be obtained by cleaving a plasmid at two sites with a restriction enzyme and religating to form a smaller circle. A smaller deletion can be obtained by cutting a plasmid at a single site. The ends of the linear DNA are then digested with an exonuclease that removes nucleotides from both strands and the shortened piece of DNA is religated.

protein expression map a map of protein expression in particular tissues or species, under particular conditions, generated from 2D electrophoresis data. Such maps are often used to compare samples exposed to different conditions, and hence to identify groups of proteins that have related functions or whose expression is interdependent. As 2D gels can reveal PTMs, the resulting maps can provide more relevant information about cellular dynamics than corresponding expression maps at the mRNA level.

protein family a set of proteins that share a common evolutionary history, often arising via duplication of an ancestral gene. Families, which tend to be defined via their sequence, functional, and/or structural relationships, can be arranged hierarchically, whereby closely related proteins with a recent common ancestor comprise subfamilies, and larger groups of distant homologues comprise superfamilies.

protein folding the process by which a polypeptide chain assumes its 3D conformation.

protein folding disease any disease that results from the abnormal folding of a protein. **Prion** diseases are examples of such diseases that can be inherited or acquired; **Alzheimer's disease** is a different type of disease, caused by alternative folding of proteins derived from the amyloid precursor.

protein fusion *an alternative name for gene fusion*.

protein G a bacterial cell-wall protein isolated from group G streptococci. Its properties and uses are similar to those of **protein A**, but it does not bind to IgM, IgD, or IgA; it does bind to all subclasses of human IgG, and animal immunoglobulins, with which protein A does not react well.

protein gene product any one of the proteins, or protein subunits, synthesized biochemically on the basis of information encoded in a genome, whether generated at **translation** or by **post-translational modification**; the pattern of protein gene products formed, or capable of being formed, by an organism is unique to any one genotype. Individual proteins are often referred to using the symbol p, followed by the relative molecular mass, e.g. p53. The protein may be further

identified by adding an indication of its origin as a superscript, e.g. p21_{ras}. A protein gene product may also be referred to by the name of the gene that encodes it, but normal font is used instead of italics, with a capital initial followed by lower case characters, e.g. Src protein encoded by *SRC* gene.

protein-glutamate methyltransferase a chemotaxis protein encoded by *cheB* (see *che*).

protein-glutamine γ -glutamyltransferase the product of one gene in invertebrates, but any of nine in vertebrates. The best known is **factor XIIIa** (EC 2.3.2.13) (see **blood coagulation**). It forms inter- and intramolecular links between a γ -carboxyl group of a glutamine residue of a protein and the ϵ -amino group of a lysine residue, releasing ammonium ion. Its natural substrate is the **fibrin** monomer, and its function is to link these into polymers.

Transglutaminase K *other names*: transglutaminase 1; keratinocyte transglutaminase; an enzyme that catalyses formation of cross-linkages in the cell envelope (see **involucrin**) that replaces the plasma membrane of fully differentiated keratinocytes where it is anchored to the inner surface of the membrane. Several mutations at 14q11.2 are responsible for an autosomal recessive form of ichthyosis.

Transglutaminase 2 *other name*: tissue transglutaminase; a constitutive enzyme in endothelial and smooth muscle cells, and inducible (e.g. by retinoic acid) in other cell types. It is localized to plasma membrane, cytoskeleton, and nucleus. The human enzyme (686 amino acids) is a G-protein (called Gh/TG2) that mediates transmembrane signalling by stimulating phospholipase C, and cell-surface adhesion following externalization by cells. It is involved in generating stimulatory gluten peptides in celiac disease.

protein intron see *intron*; **splicing** (def. 3).

protein kinase any of a number of enzymes that phosphorylate one or more hydroxyl or phenolic groups in proteins, ATP being the phosphoryl-group donor. Two classes are recognized: those that phosphorylate seryl or threonyl hydroxyls, and those that phosphorylate tyrosyl phenolic groups. The first class contains enzymes that were classically identified as regulating pathways of intermediary metabolism (e.g. glycogen **phosphorylase kinase**); subsequently, protein kinase A (**cyclic-AMP-dependent protein kinase**) and **protein kinase C** were recognized in this class. Enzyme activity of the second class is found in some cytokine receptors such as **platelet-derived growth factor receptor** and **epidermal growth factor receptor** and in oncogene products such as that of *SRC*. Over 110 unique gene products are known to make up the protein kinase superfamily; important motifs include GXGXXG...AHK and APE...DXWSXG, which are common to both serine/threonine- and tyrosine-specific activities. The tyrosine-specific kinase activity associated with the cytoplasmic domains of certain cytokine receptors forms part of an important signal-transduction mechanism implicated in cell growth (see **tyrosine kinase**).

protein kinase A *an alternative name for cyclic-AMP-dependent protein kinase*.

protein kinase B (*abbr.*: PKB) or **Akt** a cytosolic protein-serine/threonine kinase that plays a significant role in insulin and growth factor signalling, cellular survival, and transformation. It contains a pleckstrin homology domain for binding phosphatidylinositides, and is a major target for phosphatidylinositol trisphosphate kinase and for phosphatidylinositide-dependent protein kinase. The activities of these enzymes are provoked by various tyrosine kinase receptors for growth factors (e.g. those for platelet-derived growth factor, epidermal growth factor, fibroblast growth factor, and insulin). There are three isozymes (Akt 1, 2, and 3) in humans and rodents. Akt 2 (PKB β) is enriched in insulin-responsive tissues. Mice deficient in Akt 2 are insulin-resistant and develop a diabetes mellitus-like syndrome. Substrates for Akt 2 include: **GSK-3**, ribosomal S6 kinase, several transcription factors (including those of the forkhead family), and APC protein (see **APC**).

protein kinase C *abbr.*: PKC; any **protein kinase** enzyme that requires anionic phospholipid for activity, and is regulated by diacylglycerol and Ca²⁺. Such enzymes phosphorylate serine and threonine residues. Several isoforms have now been characterized: α , β_1 , β_2 , γ , δ , ϵ , ζ , θ , η , ι , and μ . Four conserved regions are recognized,

C₁, C₂, C₃, and C₄; C₃ and C₄ comprise the C-terminal half of the molecule and bear the active site, including the ATP-binding sequence GXGXXG...K. PKC- ϵ is Ca²⁺-independent, and δ , ϵ , and ζ lack the homologous C₂ region. Activation of PKC occurs when plasma membrane receptors coupled to phospholipase C are themselves activated, releasing diacylglycerol. Phorbol ester tumour promoters can substitute for diacylglycerol in enzyme activation, which may indicate their mechanism of action, and much evidence points to PKC activation being involved in cell-growth stimulation. Inhibitors of PKC attract considerable interest, and include **bisindolylmaleimide**, 1-O-hexadecyl-2-O-methylglycerol, **melittin**, **phloretin**, **polymyxin B**, and **staurosporine**.

protein kinesis the directed movement of proteins from their site of synthesis to specific targets within cells and the modulation by proteins of interactions among intracellular organelles. It is a factor in generating subcellular compartments and determining the way in which reactions are compartmentalized to control metabolic processes. It embraces the mechanisms for ensuring that proteins reach their site of action and that the amounts and locations of particular proteins are controlled during development, during the cell-division cycle, in combating pathological states of the cell, and during apoptosis.

protein mapping the resolution of a mixture of proteins into a two-dimensional pattern (i.e. map) by successive use of two differing separative procedures, as in isoelectric focusing followed by gradient gel electrophoresis, the pattern being rendered visible by an appropriate detection method.

protein phosphatase any enzyme that hydrolyses phosphate groups from proteins. With protein kinases, these enzymes provide an important mechanism for regulating cellular activity. Protein phosphatases fall into three groups. **Class I enzymes** are mainly specific for seryl- or threonyl-phosphate. Phosphatase 1 is ATP, Mg²⁺-dependent (AMD phosphatase); it consists of a catalytic subunit of 38 kDa and a regulatory (or glycogen-binding) subunit of 126 kDa, which on phosphorylation activates the phosphatase. Phosphatase 2A is polycation-stimulated (PCS), being directly stimulated by protamine, polylysine, or histone H1; it constitutes a subclass of several enzymes activated by different histones and polylysine. These have a very high affinity for the tumour promoter **okadaic acid**. Human phosphatase 2A has a catalytic subunit of 309 amino acids. This enzyme can modulate the activities of phosphorylase kinase *b*, casein kinase 2, mitogen-stimulated S6 kinase, and MAP-2 kinase. It is a cytoplasmic enzyme that exists in several oligomeric forms, all of which contain a catalytic (C) subunit (36–38 kDa) associated with one or both of two putatively regulatory subunits, the A subunit (61–65 kDa) and the B subunit (51–55 kDa). Phosphatase 2B (or **calcineurin**) consists of a subunit of 61 kDa, which contains the catalytic site and a high-affinity calmodulin-binding site, and a Ca²⁺-binding subunit of 19 kDa. Phosphatase 2C is a Mg²⁺-dependent monomeric 43 kDa protein; it has been purified as myosin light chain phosphatase, but is active against the phosphorylated forms of glycogen synthase, 6-phosphofructo-1-kinase, pyruvate kinase, fructose 1,6-bisphosphatase, and 6-phosphofructo-2-kinase. **Class II enzymes** hydrolyse tyrosylphosphates, and are generally designated 'phosphatase 3'. Some are cytoplasmic, and others are membrane-bound and may have receptor properties. **Class III enzymes** have dual specificity.

protein-Nⁿ-phosphohistidine-sugar phosphotransferase EC 2.7.1.69; *systematic name*: protein-Nⁿ-phosphohistidine:sugar Nⁿ-phosphotransferase; *other name* enzyme II; any membrane-bound bacterial enzyme that forms part of the **phosphoenolpyruvate-dependent sugar phosphotransferase system** for the transport of hexoses across the cell membrane. It involves phosphorylation of a protein substrate (9.5 kDa), a phosphocARRIER known as HPr. Individual enzymes are specific for a range of sugars. They catalyse the reaction:

protein S a single-chain glycoprotein occurring in blood, *M*, 69 000. It is a vitamin K-dependent protein (not a protease) that promotes the binding of **protein C** to platelets, and functions as a cofactor for

the anticoagulant activity of activated protein C. It is named after Seattle, where it was discovered.

protein sorting the secretory and endocytic processes by which proteins are directed to specific locations inside or outside the cell.

protein sorting signal a motif in the sequence of a protein which determines the compartment to which it is directed in the cell.

protein splicing *see* splicing.

protein storage vacuole or **vacuolar protein body** a specialized vacuole in the reserve tissue of seeds that contains 7S (vicilin-type) or 11S (legumin-type) globulins. The proteins are synthesized on the endoplasmic reticulum and transported to storage vacuoles via the Golgi apparatus, where the 7S type are glycosylated but the 11S rarely so. Protein deposition occurs during seed maturation, whereas breakdown occurs during germination to provide amino acids to the new seedling. The vacuoles also contain other proteins such as lectins and enzyme inhibitors. *Compare* protein body.

protein synthesis 1 (*in cell biology*) *see* protein and peptide biosynthesis. **2** (*in chemistry*) *see* peptide synthesis (def. 2).

protein targeting to glycozen *see* PTG.

protein thiotemplate mechanism *see* thiotemplate mechanism.

protein truncation test *abbr.*: PTT; a method for the detection of mutations that lead to the premature termination of translation and hence a truncated protein product. Preferably mRNA is the template for amplification by reverse transcription-polymerase chain reaction (RT-PCR) using a forward primer that incorporates the promoter for T7 RNA polymerase and a Kozak translation initiation sequence. The product is used in a transcription and translation system *in vitro* to produce a radiolabelled polypeptide that can be detected by autoradiography following SDS-PAGE. Alternatively, a *c-myc* epitope tag can be encoded in the forward primer enabling the detection of the protein product by anti-MYC antibodies following Western blotting. The sizes of the wild-type and mutant gene products can be compared alongside each other on the gel.

proteinuria the presence of protein in urine. Normal excretion of protein in human urine is less than 0.1 mg every 24h, about half of which is Tamm-Horsfall glycoprotein, and about 20% is albumin. Protein may appear in urine due to extrarenal factors such as fever, strenuous exercise, or burns; direct involvement of the kidney occurs in the nephrotic syndrome, which may arise from several causes, such as diabetic nephropathy, cancer of the kidney, or various forms of glomerulonephritis of unknown etiology.

protein Z a major protein of barley endosperm albumin. It is structurally similar to a serpin, but its main role is as a storage protein, being especially rich in lysine.

proteoclastic *an obsolete term for proteolytic.*

proteoglycan a molecule consisting of one or more glycosaminoglycan chains attached to a core protein.

proteolipid *a term variously applied to describe* certain hydrophobic membrane proteins, or any other protein, that has a lipid moiety covalently bound to one or more of its constituent amino acids. Many such proteins are soluble in chloroform-methanol, a property that was significant in their first identification.

proteoliposome a liposome into which a specific protein, or group of proteins, has been incorporated.

proteolysis degradation of a protein, usually by hydrolysis at one or more of its peptide bonds. —**proteolytic** *adj.*

proteolytic enzyme *see* peptidase.

proteome *see* 'ome.

proteomics *see* 'omics.

proteosome *a variant spelling of proteasome.*

prothrombin *an alternative name for factor II; see blood coagulation.*

prothymosin *see* thymosin.

protide **1** *symbol:* ^1H ; **a hydride** (def. 1) ion derived from an atom of protium. **2** any hydride (def. 2) formed from protium. **3** or **protid** *a generic name embracing* protein, peptide, or amino acid, suggested by analogy with glucide and lipid(e). Its use in English is largely restricted to translations or abstracts from French. —**protidic** *adj.*

protio+ *comb. form* indicating that one or more atoms of hydrogen in a hydrogen-containing chemical compound consists exclusively of protium.

Protista a taxonomic grouping of eukaryotic organisms that are

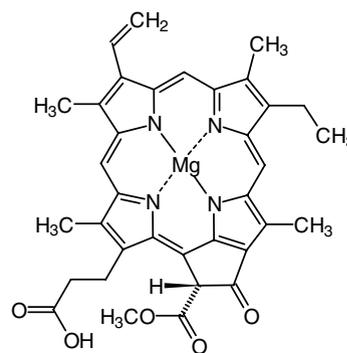

unicellular, coenocytic, or multicellular but that are not classified as fungi, animals, or embryophytes.

protium *symbol:* ^1H ; hydrogen-1, the nuclide of hydrogen, ^1_1H , of relative atomic mass 1.008. It is a stable isotope, having a relative abundance in natural hydrogen of 99.98 atom percent. The name is used especially when distinction from deuterium or tritium is required.

protoalkaloid an alkaloid that does not contain a heterocyclic ring, e.g. damascenine in *Nigella* spp.

protobiont one of the postulated first precursors of cells, supposed to have arisen when a boundary or membrane formed around one or more macromolecules possessing catalytic properties. *Compare* coacervate droplet.

protochlorophyllide Mg^{2+} -vinylpheophorphyrin A_5 methyl ether; an intermediate in the synthesis of chlorophyll, it is formed from Mg^{2+} -protoporphyrin, and converted to chlorophyllide by NADPH:protochlorophyllide oxidoreductase (EC 1.3.1.33). Protochlorophyllides may be suffixed with the letter of the related chlorophyll, e.g. protochlorophyllide *a*.

protochlorophyllide holochrome a pigment protein complex that carries out a light-catalysed reduction of protochlorophyllide to chlorophyllide with an external hydrogen donor, which is probably strongly bound NADPH. The enzyme involved in regenerating NADPH is NADPH-photochlorophyllide oxidoreductase; it is a single polypeptide, M_r 36000, and is only one component of the complex protein entity of the holochrome.

protocol a set of rules governing the way data are exchanged between computers. Computers with very different hardware and operating systems can communicate provided the same protocol is implemented on each. Whereas APIs ensure portability, protocols ensure interoperability.

protocollagen collagen chains in which proline and lysine residues have not been hydroxylated. Protocollagens may be produced by experimental inhibition of the relevant hydroxylases, either by use of a chelating agent or by imposed anaerobiosis. *Compare* procollagen.

protoheme or (*esp. Brit.*) **protohaem** the iron-porphyrin prosthetic group of the cytochromes *b*.

protohemin *see* hemin.

protokaryon *an obsolete term for prokaryon.*

protokaryote *an obsolete term for prokaryote.*

protolysosome *see* primary lysosome.

protomer any of the subunits of an oligomeric protein that are identical. *See also* monomer, oligomer. —**protomeric** *adj.*

proton 1 *symbol:* $^1\text{H}^+$; the cation derived from an atom of protium; a hydrogen ion of nucleon number unity; used in this sense especially when distinction between $^1\text{H}^+$, $^2\text{H}^+$ (i.e. deuterium), and $^3\text{H}^+$ (i.e. tritium) is needed; any solvated species is included. **2** *symbol:* H^+ ; *commonly used term for* the cation derived from any atom of natural hydrogen (of which a small proportion is deuterium) by loss of its orbital electron; any solvated species is included. *See also* hydrogen ion, hydron. **3** *symbol:* *p*; a nuclear particle of nucleon number unity,

having a charge equal and opposite to that of an **electron** and having a mass of 1.007 276 470 (12) Da. —**protonic** *adj.*

proton magnetic resonance *abbr.*: PMR or pmr; *see* **nuclear magnetic resonance spectroscopy**.

proton magnetogyric ratio *symbol*: γ_p ; a fundamental physical constant, of value $2.675\ 221\ 28(81) \times 10^8\ \text{s}^{-1}\ \text{T}^{-1}$. *See also* **gyromagnetic ratio**.

protonmotive indicating, or related to an ability to transport protons (i.e. hydrons).

protonmotive force the driving force that leads to a gradient of protons (hydrons) across a membrane, for example of the mitochondrial inner membrane or the chloroplast thylakoid membrane. The protonmotive force was named by P.D. Mitchell, by analogy with electromotive force, and is conventionally given the symbol, $\Delta\mu_{\text{H}^+}$ and expressed in volts. It comprises two components, the electrostatic potential $\Delta\psi$ and the pH gradient, ΔpH . It may be produced by coupling to electron transfer reactions, or to the hydrolysis of ATP.

protonmotive Q cycle a hypothetical mechanism put forward to explain the **protonmotive** and **redox** properties of certain components of the **respiratory chain** in the **coupling membrane** of bacteria, mitochondria, and chloroplasts. The **Q cycle** applies to the part of the respiratory chain involving passage of electrons through cytochrome *b*. Essentially, the cycle accepts two hydride ions from a reduced flavoprotein (e.g. of complex I or complex II of the respiratory chain; *see* **complex I**, **II**, **III**, **IV**) passes electrons singly to cytochrome c_1 and releases the two hydrons to the intermembrane space. **Ubiquinone** is the molecule that accepts the hydride ions, and releases the electrons and hydrons. Cytochromes b_{566} and b_{562} are involved in shuttling electrons between different oxidation states of ubiquinone during the cycle. The property of ubiquinone that it can exist as a **semiquinone** is important in the switch from two-electron to one-electron transfer.

proton number or **atomic number** *symbol*: *Z*; a dimensionless physical quantity, with a unique integral value for each chemical element, that is equal to the number of protons contained in the nucleus of each atom of the element irrespective of the mass of any particular atom. It also is equal to the number of unit positive charges on the nucleus of each atom of a given chemical element, to the number of orbital electrons surrounding the nucleus of an un-ionized atom of that element, and, for a specific nuclide of that element, to the arithmetical difference between the nuclide's **nucleon number**, *A*, and its **neutron number**, *N*; i.e. $Z = N - A$. The proton number of an element determines the position of the element in the periodic table. It may be attached to the symbol for the element as a left subscript, e.g. ${}_6\text{C}$.

proton pump *another term (esp. in pharmacology) for hydrogen-ion pump*.

proton relaxation enhancement *abbr.*: PRE; a technique that yields information concerning (macro)molecular motion. It depends on the enhancement of the solvent water-proton relaxation rates on addition of a macromolecule.

protooncogene a normal gene, usually concerned with the regulation of cell proliferation, that can be converted into a cancer-promoting **oncogene** by mutation. For example, in the case of the Rous sarcoma virus the viral oncogene is *v-src* (*see* **src**). This is closely related to a normal gene, *c-src*. The appearance of *v-src* is believed to have followed the acquisition of a copy of *c-src* by an ancestor of the Rous sarcoma virus. Through many generations this ancestral gene was mutated and became dominant. Protooncogenes encode proteins involved in all aspects of controlling cell proliferation, including growth factors, growth-factor receptors, nuclear factors regulating gene expression proteins that generate second messengers, and protein kinases.

protoplasm the living contents of a cell; i.e. the matter contained within (and including) the plasma membrane, usually taken to exclude large vacuoles and masses of secretory or ingested material. In eukaryotes it includes the **nucleus** and **cytoplasm**.

protoplast a spherical, osmotically sensitive plant cell without its cell wall but retaining an intact cell membrane. The cell wall is degraded by digestion with different hydrolytic enzymes, as a mixture or sequentially, e.g. cellulase, hemicellulase. Protoplasts are used to

create hybrid cells via protoplast fusion. In some cases they are totipotent, and are thus capable of yielding plants. Such protoplasts can be used in plant transformation.

protoporphyrin IX the specific substrate for the enzyme **ferrochelatase**, which catalyses the insertion of iron to form **protoheme**. It is also probably the substrate for the insertion of magnesium in the formation of chlorophylls in plants.

prototroph any strain of a microorganism (alga, bacterium, or fungus) that does not require any substances in its nutrition additional to those required by the wild type. *Compare* **auxotroph**. —**prototrophic** *adj.*

Protozoa a phylum or subkingdom comprising single-celled eukaryotic microscopic organisms, usually classified as animals. *Compare* **Metazoa**, **Parazoa**.

provirus a virus, e.g. a **retrovirus**, that is integrated into the chromosome of its host cell and can be transmitted through the generations without causing lysis of the host cell.

provitamin a compound which is converted to an active vitamin in the body. In practice the term is only applied to **carotenes**.

Pro-X dipeptidase EC 3.4.13.8; *recommended name*: prolinase; *other names*: prolyl dipeptidase; iminodipeptidase; prolinase; L-prolylglycine dipeptidase; an enzyme that catalyses the hydrolysis of Pro-[Xaa dipeptides. It also acts on hydroxyprolyl analogues.

proximal protein any protein that binds early in the assembly of complex structures, such as ribosomes. Their presence in the partially assembled structure is required for the binding of **distal proteins**.

proximate carcinogen or **proximate carcinogenic metabolite** any metabolite of a **chemical carcinogen** that is itself carcinogenic; the term may embrace **ultimate carcinogen**.

Prozac *see* **fluoxetine**.

PrP *abbr.* for prion protein.

PRP protein *abbr.* for pre-mRNA processing protein.

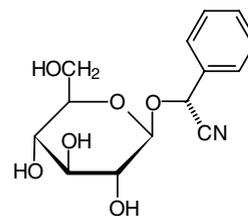

PRPP *abbr.* (*not recommended*) for phosphoribosyl pyrophosphate (*see* **(5)-phospho(- α -D-ribose) diphosphate**).

PRPP synthetase *another name for ribose-phosphate pyrophosphokinase*.

PR protein *abbr.* for pathogenesis-related protein.

pRSETA one of a family of phagemid vectors designed for high levels of expression of proteins in *E. coli*. The gene of interest is cloned downstream from the promoter for T7 RNA polymerase. When propagated in BL21 (DE3) cells the expression of T7 RNA polymerase can be induced with isopropyl β -thiogalactoside (IPTG), which then transcribes the cloned gene.

prunasin (-)-(*R*)-mandelonitrile β -D-glucoside; a **cyanogenic glycoside**.

ps *symbol for picosecond*.

P-selectin *see* **selectin**.

pseudoachondroplasia *see* **achondroplasia**.

pseudoalkaloid any **alkaloid** in which the skeleton is partly derived from a terpene.

pseudoallele any of two (or more) mutations that are allelic functionally but not structurally. *See* **allele**.

pseudoaxial (*in chemistry*) *abbr.*: *a'*; *see* **conformation**.

pseudocholinesterase EC 3.1.1.8; *recommended name*: cholinesterase; *other name*: choline esterase II. An enzyme, found in blood and other tissues, that catalyses the hydrolysis of a variety of choline esters and a few other compounds. *Compare* **acetylcholinesterase**.

pseudoequatorial (in chemistry) *abbr.*: e'; see **conformation**.

pseudonexon a portion of an **exon** that is duplicated in an adjacent **intron**.

pseudogene *symbol*: ψ ; a sequence in DNA that is related to a functional gene but cannot be transcribed. This may be due to mutational changes that preclude it from being expressed in the form of functional products or the lack of some flanking control region in the promoter. Pseudogenes may or may not contain the introns of the functional gene. Examples include pseudogenes for α , β , and ζ globulins in several species, V_{κ} chains of immunoglobulins, actin, and tubulin. **Processed pseudogenes**, or **LINES** (see **LINE**), occur in a genome somewhere other than the normal position of the corresponding functional gene and so cannot be expressed because of alterations in regulatory DNA sequences, or coding sequences, or both.

pseudoglobulin a globulin that is soluble in solutions of low ionic strength, or in pure water. *Compare* **euglobulin**.

pseudohypoadosteronism type II see **WNK**.

pseudointron an **intron** that contains 5' and 3' splice sites that are appropriate but not utilized in the excision of the intron.

pseudoisoenzyme any one of the epigenetically derived multiple forms of an enzyme.

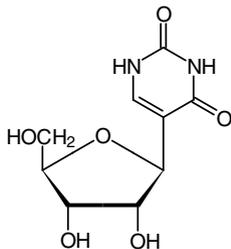

pseudo-operator a functional **operator** element within a structural protein-coding region of DNA.

pseudopepsin see **pepsinogen**.

pseudoplasmodium see *Dictyostelium discoideum*.

pseudopodium (*pl.* **pseudopodia**) a temporary protrusion or retractile process of a cell, associated with flowing movements of the protoplasm and serving for locomotion and feeding. —**pseudopodial** *adj.*

pseudouridine *symbol*: Ψ ; 5- β -D-ribofuranosyluracil; a component of **transfer RNA** (tRNA) containing a C-C bond between the ribose (C-1) and uracil (C-5). Typical of the **minor nucleosides** present in tRNA, it is formed by modification of uridine in the original transcript; the chemistry of this process is unclear. When pseudouridine occurs in the anticodon of transfer RNA it base pairs with adenine. Mutation in the gene for dyskerin, a putative pseudouridine synthase, results in dyskeratosis congenita. *Compare* **uridine**.

pseudouridine synthase E.C.4.2.1.70; *other name*: pseudouridylylate synthase; any of the enzymes (e.g. ψ S1, PUS1) that catalyse the conversion of uridine residues in RNA to pseudouridine. They include the dyskeratosis congenita gene product, **dyskerin**. Members of the family differ in their specificity for RNA substrates.

pseudoxanthoma elasticum a hereditary disorder of connective tissue that affects skin, retina, and blood vessels. There is accumulation of calcium in these and in other tissues, with the formation of yellowish lumps in the skin. Several mutations in an ABC transporter (ABCC6) cause the disorder.

PshAI a type 2 **restriction endonuclease**; recognition sequence: GACNN \uparrow NGTC.

PshBI a type 2 **restriction endonuclease**; recognition sequence: AT \uparrow TAAAT. *VspI* is an **isoschizomer**.

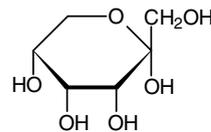

psi 1 *symbol*: ψ (lower case) or Ψ (upper case); the twenty-third letter of the Greek alphabet. For uses see **Appendix A. 2** or **p.s.i.** *abbr.* for pounds per square inch (a unit of pressure in the Imperial and US systems of units).

PSI *abbr.* for photosystem I (see **photosystem**).

PSI-BLAST *abbr.* for position-specific iterated-BLAST; see **database-search program**.

psicofuranine 6-amino-9-D-psicofuranosylpurine; an antibiotic produced by *Streptomyces hygroscopicus*, found to have antitumor activity. *See also* **D-psicose**.

D-psicose a *nonsystematic name* for the keto-hexose D-ribo-2-hexulose. The hydroxyl at C-3 has the opposite configuration to that of D-fructose. It is a component of **psicofuranine**.

α -D-pyranose form

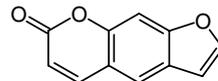

PSII *abbr.* for photosystem II (see **photosystem**).

psilocin 3-[2-(dimethylamino)ethyl]-1*H*-indol-4-ol; a hallucinogenic alkaloid extracted from the mushroom *Psilocybe mexicana*.

P-site *abbr.* for a peptidyl-tRNA binding site of **ribosome**; in bacteria this involves the **ribosomal proteins** L2, L14, L18, L24, L27, and L33, and a region close to the 3' end of 16S rRNA.

psoralen 6-hydroxy-5-benzofuranacrylic acid δ -lactone; a furocoumarin present as a **phytoalexin** in many plants. It has photosensitizing and phototoxic effects in humans and animals, and is used in photochemistry, intercalating into DNA and forming cross-links on irradiation. *See also* **methoxy psoralen**.

PSP *abbr.* for pancreatic stone protein (see **pancreatic thread protein**).

Psp1406I a type 2 **restriction endonuclease**; recognition sequence: AA \uparrow CGTT. *AccII* is an **isoschizomer**.

pSPORT 1 one of a proprietary series of vectors for cloning cDNA in *E. coli*.

PSSM (*usually pronounced 'possum'*) *abbr.* for position-specific scoring matrix.

PstI a type 2 **restriction endonuclease**; recognition sequence: CTGCA \uparrow G.

pSV vector a plasmid vector designed for the expression of cloned sequences in mammalian cells driven by the SV40 early promoter and enhancer.

psychosine 1-*O*- β -D-galactosylsphingosine; it is formed from UDP-galactose and sphingosine by sphingosine β -galactosyltransferase, EC 2.4.1.23. It is acylated to a cerebroside by reaction with a long-chain acyl-CoA.

psychrometer or **wet-and-dry bulb hygrometer** a type of hygrometer consisting of two thermometers, one with a wet bulb and one with a dry bulb. The cooling effect of evaporation from the wet bulb creates a temperature difference between the two thermometers, from which the relative humidity can be calculated.

psychrophile an organism that grows best at low temperatures (below about 20 °C). —**psychrophilic** *adj.*

P system a system of blood groups in which the antigenic determinants are oligosaccharides. The antigens are detected on erythrocytes, erythroblasts, platelets, megakaryocytes, fibroblasts, and en-

endothelial cells; they are designated P^k, P, and P₁. The common phenotypes are P₁ (antigens P₁ and P positive) and P₂ (P antigen positive); P^k phenotypes are rare. Individuals with the p phenotype lack all of the above determinants, having only the core structure lactosylceramide, and have anti-P and anti-P^k antibodies. The determinants are:

Pk (Gb₃Cer): Gal(α1-4)Gal(β1-4)GlcCer

Pk (Gb₄Cer): GalNAc(β1-3)Gal(α1-4)Gal(β1-4)GlcCer

P1: Gal(α1-4)Gal(β1-4)GlcNAc(β1-3)Gal(β1-4)GlcCer.

Pt symbol for platinum.

PTA *abbr.* for plasma thromboplastin antecedent (i.e. factor XI); *see* **blood coagulation**.

PTB domain *abbr.* for phosphotyrosine-binding domain. *See* **SH2 domain**.

PTC *abbr.* for 1 plasma thromboplastin component (i.e. factor IX); *see* **blood coagulation**. **2** phenylthiocarbonyl.

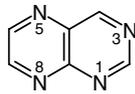

Ptd symbol for the phosphatidyl group.

PtdIns symbol for phosphatidylinositol.

PtdIns4P or **PtdIns-4-P** symbol for phosphatidylinositol 4-phosphate.

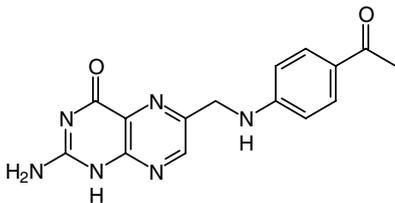

PtdIns(4,5)P₂ or **PtdIns-4,5-P₂** symbol for phosphatidylinositol 4,5-bisphosphate.

pteridine pyrazino[2,3-*d*]pyrimidine; the parent structure of pterins and the **pteroyl** group. *See also* **xanthopterin**.

pterin-4α-carbinolamine dehydratase *abbr.*: PCD. EC 4.2.1.96; an enzyme activity of liver and other tissues that is part of a bifunctional protein (*abbr.*: PCD/DCoH; 103 amino acids) that also acts as the dimerization cofactor for hepatocyte nuclear factor 1a (*abbr.*: DCoH). The enzyme converts 4α-carbinolamine tetrahydrobiopterin (formed during the conversion of phenylalanine to tyrosine) to quinonoid dihydrobiopterin by elimination of water. It also prevents nonenzymatic conversion of tetrahydrobiopterin to **primapterin**. Several mutations in the protein lead to deficiency of PCD activity, with consequent hyperphenylalaninemia and primapterinuria. *See* **biopterin**.

pteroyl 4-[[[(2-amino-1,4-dihydro-4-oxo-6-pteridinyl)methyl]amino]benzoyl]; the acyl group of pteric acid, and the structural basis of **folate** and its derivatives.

PTFE *abbr.* for polytetrafluoroethylene.

PTG *abbr.* for protein targeting to glycogen; a protein (294 amino acids), expressed predominantly in insulin-sensitive tissues, that binds to the catalytic subunit of **protein phosphatase 1** and localizes it to glycogen. It also forms complexes with phosphorylase kinase, phosphorylase *a* (*see* **phosphorylase**), and **glycogen synthase**.

PTGS *abbr.* for post-transcriptional gene silencing. *See* **RNA silencing**.

PTH *abbr.* for 1 parathyroid hormone (i.e. **parathyrin**). **2** phenylthiohydantoin; as in PTH-amino acid (i.e. the phenylthiohydantoin derivative of an amino acid).

PTI *abbr.* for pancreatic trypsin inhibitor.

PTM *abbr.* for post-translational modification.

PTNP11 *abbr.* for protein tyrosine phosphatase nonreceptor type 11. *See* **Noonan syndrome**.

Ptpzr *abbr.* for protein tyrosine phosphatase receptor z. *See* **Helicobacter pylori**.

pTriEX a proprietary plasmid vector that enables the expression of genes in bacterial, insect, and mammalian cells from a single plasmid.

PTS *abbr.* for 1 phosphoenolpyruvate-dependent sugar phosphotransferase system. **2** peroxisome targeting sequence.

PTS receptor either of two proteins that recognize a **peroxisome targeting sequence** (PTS) in targeting proteins to the peroxisomal matrix. Both are PEX proteins (*see* **peroxin**); PEX5 binds PTS1, while PEX7 binds PTS2.

PTT *abbr.* for protein truncation test.

ptyalin a substance in saliva, identified as α-amylase.

P-type transporter a member of a family of membrane transport proteins, found in bacteria, archaea and eukaryotes, that catalyze cation uptake and/or efflux driven by ATP hydrolysis. Most are multisubunit complexes with a large subunit serving the primary ATPase and ion translocation functions. Distinct bacterial enzymes specific for K⁺ or Mg²⁺ (uptake), Ca²⁺, Ag⁺, Zn²⁺, Co²⁺, Pb²⁺, Ni²⁺, and/or Cd²⁺ (efflux) and Cu²⁺ or Cu⁺ (uptake or efflux, depending on the system) have been characterized.

Pu symbol for plutonium.

PuMed *see* **information retrieval software**.

pUC vector any of a series of plasmid cloning vectors having an ampicillin resistance gene and part of the *lacZ* gene encoding the α-peptide containing a multiple cloning site (MCS). Different members of the series (e.g. pUC18, pUC19) differ in the orientation of the MCS. They are high copy number plasmids and so can be purified by rapid, small-scale methods of isolation. A related series of bacteriophage M13 vectors, the M13mp vectors, contain the same MCS and are useful for DNA sequencing. *See also* **Messing vector**.

PUFA *abbr.* for polyunsaturated fatty acid.

puff any discrete, localized expansion occurring at specific sites in polytene chromosomes, e.g. the giant salivary gland chromosomes in Diptera. Typically a few micrometres long, they are believed to be a gene or group of genes that are actively synthesizing RNA, which accounts for a considerable part of the mass of the puff. *See also* **Balbani ring**.

puffer fish *see* **Fugu**.

pull-down technique a method for investigating protein–protein interactions in which a protein of interest is expressed as a fusion protein with glutathione-S-transferase (GST) or an epitope tag such as 6 × His or c-Myc. This is used to explore previously unknown interactions with other proteins in a mixture such as a cell extract. Protein complexes formed with the fusion protein are precipitated either with specific antibodies or with a suitable affinity adsorbent, and the nature of the bound proteins is identified by gel electrophoresis and mass spectrometry.

'pull' model a nickname for the **Monod–Wyman–Changeux model** (for ligand-induced changes in protein conformation) because, in this model, ligands influence the equilibrium between enzyme states by sequestering the enzyme in ligand-bound forms. *Compare* **'push' model**.

pullulan an extracellular **glucan** elaborated by *Aureobasidium pullulans* (yeast form) and formed by other fungi. It is a linear structure with both (1→4)-α-D- and (1→6)-α-D-linkages. Pullulan is used as a non-caloric material, a water-retention agent, and as a film and fibre former.

pullulanase 1 isopullulanase EC 3.2.1.57; an enzyme that catalyses the hydrolysis of **pullulan** to isopanose (i.e. 6-α-maltosylglucose). **2 neopullulanase** EC 3.2.1.135; an enzyme that catalyses the hydrolysis of pullulan to panose (i.e. 6-α-D-glucosylmaltose). **3** *see* α-dextrin endo-1,6-α-glucosidase.

pulmonary surfactant a secretion, produced by type II cells of alveoli and bronchial mucosa, that forms a monolayer at the alveolar air–water interface to lower the surface tension. It consists primarily of dipalmitoyllecithin, unsaturated lecithin and phosphatidylglycerol, and surfactant proteins B and C. The surfactant's components are essential at birth to convert a fluid-filled lung to one filled with air. They are cleared by the type II cells and

pulse-chase experiment

macrophages for recycling or degradation. Secretion and clearance are increased by exercise.

pulse-chase experiment a technique whereby cells growing in culture are exposed for a short period (pulse) to a radiolabelled molecule such as an amino acid and then transferred to a medium containing an excess of the nonlabelled substance for a longer period (chase). By removing samples at intervals the fate of intracellular components labelled during the pulse can be ascertained.

pulsed field gel electrophoresis *abbr.*: PFGE; a type of **gel electrophoresis** in which fragments of DNA in the megabase size range can be separated by continuously altering the angle at which the electric current is applied.

pulse radiolysis a technique whereby reactive chemical species are generated by pulses of high-energy radiation and the subsequent reactions of these species are followed spectrophotometrically as a function of time.

Pumilio a protein of *Drosophila* that binds the Nanos response elements in the 3' untranslated region of the *hunchback* mRNA and recruits the proteins Nanos and Brain tumor to suppress its translation. It contains eight repeats of a ≈ 36 residue trihelical sequence that assemble into an arched structure. Through its concave surface this arch binds the RNA motifs, which have a core UGU trinucleotide sequence; while through the outer surface of repeats 7 and 8 it binds with Nanos and Brain tumor, respectively. A homologue in *Xenopus*, called XPum, is present throughout oogenesis. There is also a human homologue.

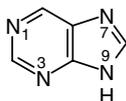

pump (*in cell biology*) any transmembrane protein that drives the active transport of ions and small molecules across the lipid bilayer. *See also* **hydrogen-ion pump**, **sodium pump**.

PUMP-1 *see* **matrilysin**.

pump-1 protease *see* **matrilysin**.

Punnett square a matrix showing all possible combinations of alleles in a genetic cross. [After Reginald Punnett (1875–1967), British geneticist.]

purine 1 *1H*-purine; *7H*-imidazo[4,5-*d*]pyrimidine; an organic nitrogenous base, sparingly soluble in water. **2** any of a class of derivatives of *1H*-purine; these form one of the two classes of nitrogen-containing ring compounds found in DNA and RNA, which include **adenine** and **guanine**. *See also* **purine biosynthesis**.

purine biosynthesis the biosynthesis of purine ribonucleotides. The pathway begins with the formation of 5-phospho- α -D-ribose diphosphate (5-phosphoribosyl- α -D-pyrophosphate, *common abbr.*: PRPP) by ribose-phosphate pyrophosphokinase, EC 2.7.6.1. This is converted to β -5-phosphoribosylamine (I) by reaction with glutamine, catalysed by amidophosphoribosyltransferase, EC 2.4.2.14; reaction of I with glycine, with hydrolysis of ATP to ADP and P_i , catalysed by **phosphoribosylamine-glycine ligase**, EC 6.3.4.13 (glycinamide ribonucleotide synthetase, *common abbr.*: GAR synthetase), brings about the formation of *N*¹-(5-phospho-D-ribose)glycinamide (II, glycinamide ribotide, *common abbr.*: GAR); II reacts with 10-formyltetrahydrofolate to form 5'-phosphoribosyl-*N*-formylglycinamide (III, *common abbr.*: FGAR), the enzyme being **phosphoribosylglycinamide formyltransferase**, EC 2.1.2.2 (GAR transformylase); III is converted to 5'-phosphoribosylformylglycinamide (IV, formylglycinamide ribotide, *common abbr.*: FGAM) by **phosphoribosylformylglycinamide synthase**, EC 6.3.5.3 (*common abbr.*: FGAM synthetase) by reaction with glutamine with ATP hydrolysis to ADP and P_i . IV is converted to 1-(5-phosphoribosyl)-5-aminoimidazole (V, 5-aminoimidazole ribotide, *common abbr.*: AIR), with hydrolysis of ATP to ADP and P_i , by **phosphoribosylformylglycinamide cyclo-ligase**, EC 6.3.3.1 (*common abbr.*: AIR synthetase); V is carboxylated to 1-(5-phosphoribosyl)-5-amino-4-imidazolecarboxylate (VI, carboxyaminoimidazole carboxamide, *common abbr.*: CAIR), by **phosphoribosylaminoimidazole**

putidaredoxin

carboxylase, EC 4.1.1.21 (*common abbr.*: AIR carboxylase); VI reacts with L-aspartate, with hydrolysis of ATP to ADP and P_i , to form 1-(5-phosphoribosyl)-5-amino-4-(*N*-succinocarboxamide)-imidazole (VII, 4-(*N*-succinocarboxamide)-aminoimidazole ribotide, *common abbr.*: SACAIR) catalysed by **phosphoribosylaminoimidazole succinocarboxamide synthase**, EC 6.3.2.6 (*common abbr.*: SACAIR synthetase); VII is converted, with loss of fumarate, to 1-(5-phosphoribosyl)-4-carboxamide-5-aminoimidazole (VIII, aminoimidazolecarboxamide ribotide, *common abbr.*: AICAR) by adenylosuccinate lyase, EC 4.3.2.2 (VII is an alternative substrate for this enzyme); VIII reacts with 10-formyltetrahydrofolate to form 5'-phosphoribosyl-5-formamido-4-imidazolecarboxamide (IX, formaminoimidazolecarboxamide ribotide, *common abbr.*: FAICAR), catalysed by **phosphoribosylaminoimidazolecarboxamide formyltransferase**, EC 2.1.2.3 (*common abbr.*: AICAR transformylase); IX undergoes ring closure catalysed by IMP cyclohydrolase, EC 3.5.4.10, to form inosine monophosphate (IMP), from which other purine nucleoside monophosphates are formed. Thus it is converted to AMP via adenylosuccinate, in steps catalysed by adenylosuccinate synthase, EC 6.3.4.4, and adenylosuccinate lyase, EC 4.3.2.2. It is converted to GMP via xanthosine monophosphate, in steps catalysed by **IMP dehydrogenase**, EC 1.1.1.205, and **GMP synthase**, EC 6.3.4.1. A **salvage pathway** converts purine bases released during nucleic-acid degradation to nucleoside monophosphates. The enzymes adenine phosphoribosyltransferase and hypoxanthine-guanine phosphoribosyltransferase are responsible for these reactions.

purine-nucleoside phosphorylase *abbr.*: PNP; EC 2.4.2.1; *systematic name*: purine-nucleoside:orthophosphate ribosyltransferase; *other name*: inosine phosphorylase. An enzyme that catalyses the phosphorolysis of a purine nucleoside to a purine and α -D-ribose 1-phosphate. It functions in the degradation of purines; decreased activity leads to accumulation of dGTP, which affects DNA replication. Enzyme deficiency is associated with moderate immunodeficiency.

purinergic describing a type of nerve in which synaptic transmission is brought about by purine-like transmitter substances. *See* **purinoceptor**. *Compare* **adrenergic**, **cholinergic**.

purine salvage pathway a pathway by which the purine bases arising from degradation of RNA are used for the biosynthesis of nucleotides. Two **phosphoribosyltransferases** are involved, one for adenine (adenine phosphoribosyltransferase, APRT) and one for guanine or hypoxanthine (hypoxanthine/guanine phosphoribosyltransferase, HGPRT). *See also* **hypoxanthine phosphoribosyltransferase**.

purinoceptor or **purinergic receptor** a family of receptors (P_1 , P_{2X} , P_{2Y} , P_{2Z} , P_{2T} , and P_{2U}) classified according to the relative potency of purine nucleotides – ATP, ADP, AMP, and UTP – in stimulating them and by their response to either adenosine (P_1) or ATP (P_2). P_{2Y} and P_{2U} are G-protein-associated membrane receptors that regulate turnover of phosphoinositides. P_{2X} , P_{2Z} , and P_{2T} modulate the opening of an intrinsic cation channel but P_{2T} also stimulates release of intracellular Ca^{2+} and reduces synthesis of cyclic AMP.

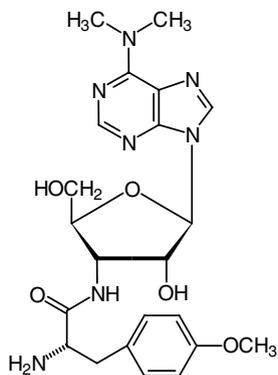

puromycin a nucleoside antibiotic produced by the soil actinomycete *Streptomyces alboniger*. It interrupts protein synthesis by virtue of its structural similarity to the 3' end of aminoacyl-tRNA: it enters the A-site (*see* **aminoacyl site**) on the ribosome, and is incorporated into the growing polypeptide chain, thereby causing premature release of the puromycinyl polypeptide from the ribosome.

purothionin any of a group of basic peptides, isolated from grain and of M_r \approx 5000, that contain a large number of cysteine residues, and are toxic to bacteria and fungi by inhibiting DNA transcription and RNA translation.

purple membrane part of the cell membrane of *Halobacterium halobium* containing **bacteriorhodopsin**.

'push' model a nickname for the **Koshland model** (for ligand-induced changes in protein conformation) because, in this model, binding of the ligands results in a conformational change, and does not simply select a pre-existing state. *Compare* **'pull model'**.

putidaredoxin a ferredoxin, isolated from *Pseudomonas putida*, that is an electron carrier in a hydroxylase system acting on camphor and closely related monoterpenes. *Compare* **adrenodoxin**.

puromycin

putrescine 1,4-diaminobutane; the polyamine formed by decarboxylation of **ornithine** and the metabolic precursor of **spermidine** and **spermine**.

PVA *abbr. for* **1** polyvinyl alcohol. **2** polyvinyl acetate.

p-value (*in sequence analysis*) a statistical measure of the significance of a match obtained by searching a database with a query sequence. The p-value denotes the probability of a match occurring with a score better than or equal to the score of the retrieved match, relative to the expected distribution of scores that result when random sequences of the same length and composition as the query are compared with the database. The closer the p-value to 0, the more significant the match.

PVC *abbr. for* polyvinyl chloride.

PVDF *abbr. for* polyvinylidene fluoride.

PVP *abbr. for* polyvinyl pyrrolidone.

PvuI a type 2 **restriction endonuclease**; recognition sequence: CGAT↑CG.

PvuII a type 2 **restriction endonuclease**; recognition sequence: CAG↑CTG.

PWM *abbr. for* pokeweed mitogen.

pYAC4 a yeast artificial chromosome vector for cloning *EcoRI* fragments of 50–100 kb.

pycnodysostosis a disorder of bone matrix remodelling caused by **cathepsin K** deficiency in osteoclast lysosomes, which accumulate partially degraded collagen type I fibrils. The syndrome is characterized by short stature, dysmorphism, osteosclerosis of long and of flat bones, hypoplasia of craniofacial bones and phalanges, pathological fractures, and dental abnormalities. Several point mutations in the **cathepsin K** gene are responsible.

pycnometer an apparatus for measuring the density of liquids, and also sometimes of solids. It consists of a container whose volume can be accurately measured, and that can be filled with great precision, so that when filled with the liquid in question it can be weighed to determine the density. —**pycnometric** *adj.*

pYD1 a proprietary yeast vector designed to target and display recombinant proteins at the surface of *Saccharomyces cerevisiae* as a fusion protein with the α -agglutinin subunit AGA2.

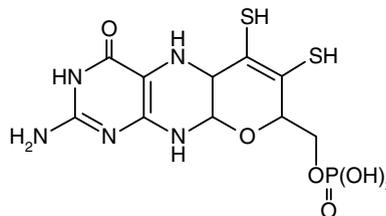

Pyd *symbol for* a residue of an unspecified pyrimidine nucleoside (alternative to Y).

pyr-1 the symbol for the pyrimidine 1 gene, which encodes **CAD protein** in several eukaryotes.

pyran the *trivial name for* either of the hypothetical isomers α -pyran, 2*H*-pyran, oxacyclohexa-3,5-diene, or γ -pyran, 4*H*-pyran, oxacyclohexa-2,5-diene, C_6H_6O . These pyrans are not known as such, but are the parent structures of various known pyranoid compounds such as dihydropyran, α - and γ -pyrones, and pyranoses.

pyranoid pyran-like, i.e. describing a molecular structure that consists of or contains a ring of five carbon atoms and one oxygen atom (as in **pyran**).

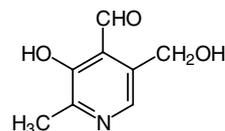

pyranopterin *preferred name for* the pterin component of the molybdenum and tungsten cofactors.

pyranose *symbol: p*; any monosaccharide or monosaccharide derivative whose molecule contains a **pyranoid** ring. *Compare* **furanose**, **septanose**.

pyridine-nucleotide coenzyme any coenzyme containing a nicotinamide nucleotide residue, e.g. nicotinamide-adenine dinucleotide (NAD⁺); now known as **nicotinamide-nucleotide coenzymes**.

pyridoxal *abbr.:* PL; 3-hydroxy-5-(hydroxymethyl)-2-methyl-4-pyridine carboxaldehyde; a compound with **vitamin B₆** activity.

pyridoxal kinase EC 2.7.1.35; an enzyme that catalyses the formation of pyridoxal 5'-phosphate from ATP and pyridoxal with release of ADP.

pyrimidine 1 1,3-diazine; an organic nitrogen base, sparingly soluble in water. **2** any of a class of derivatives of pyrimidine (def. 1); these form oPZP ne of the two categories of nitrogen-containing ring compounds found in DNA and RNA, which include **cytosine**, **thymine**, and **uracil**. *See also* **pyrimidine biosynthesis**.

pyrimidine biosynthesis or **pyrimidine ribonucleotide biosynthesis** pyrimidines are formed from carbamoyl phosphate (*see* **carbamoyl-phosphate synthase**) after conversion to carbamoyl aspartate in a reaction with L-aspartate catalysed by **aspartate transcarbamylase**, EC 2.1.3.2. Carbamoyl aspartate is converted to orotate via dihydroorotate, in steps catalysed by **dihydroorotase**, EC 3.5.2.3, and dihydroorotate dehydrogenase, EC 1.3.99.11. Orotate is phosphorylated to orotidine monophosphate (OMP) in a reaction with 5-phospho- α -D-ribose diphosphate catalysed by **orotate phosphoribosyltransferase**, EC 2.4.2.10. OMP is converted to uridine monophosphate by **orotidine 5'-phosphate decarboxylase**, EC 4.1.1.23.

pyrimidine dimer any structure formed within a strand of DNA from two neighbouring pyrimidine residues through covalent cross-linking induced by ultraviolet irradiation. Two types are known. (1) Addition of one pyrimidine ring to the other at each end of their respective 5,6-double bonds generates a **cyclobutadipyrimidine**, a fully substituted cyclobutane. Such a dimer is formed most readily from two thymine residues (*see* **thymine dimer**), but may be formed also from two cytosine residues, or from one cytosine and one thymine residue. For each of these varieties there are four possible configurational isomers: if the pyrimidine rings have become linked in a parallel manner, i.e. by 5–5' and 6–6' bonds, the configuration is designated by the prefix *syn*-, but if they are linked in an antiparallel manner, i.e. by 5–6' and 6–5' bonds, it is designated by *anti*-; further, if the pyrimidine rings are both on the same side of the plane

pyrimidine-nucleoside phosphorylase

of the cyclobutane ring, the dimer is described as being in the 'dog-house configuration', designated by the prefix *cis*-, but if the rings are on opposite sides of the cyclobutane plane, the dimer is said to be in the 'chair configuration', designated by *trans*-. The presence of a cyclobutadipyrimidine in a DNA strand causes a local distortion of the DNA duplex and blocks the action of DNA polymerase, thus preventing replication; cell death may ensue unless repair is effected by **photoreactivation**. (2) Alternatively, addition may take place between position 6 of one pyrimidine residue and position 4 of an adjacent one, with creation of a single covalent link and generation of a (6-4)**photoproduct**. Such a dimer is usually formed between position 6 of a cytosine or thymine residue on the 5' side of a dinucleotide segment and position 4 of a cytosine residue on its 3' side. The (6-4)photoproduct is thought to be the main type of lesion in DNA responsible for mutations; it is not susceptible to photoreactivation, but can be eliminated by other DNA-repair mechanisms, e.g. **excision repair**.

pyrimidine-nucleoside phosphorylase 1 **uridine phosphorylase** EC 2.4.2.3; an enzyme that catalyses the phosphorolysis of uridine to uracil and α -D-ribose 1-phosphate. **2 thymidine phosphorylase** EC 2.4.2.4; an enzyme that catalyses the phosphorolysis of thymidine to thymine and 2-deoxy-D-ribose 1-phosphate.

pyrin *see* **familial Mediterranean fever**.

pyro- or (*before a vowel*) **pyr**+ *comb. form* **1** of, relating to, caused, or produced by fire. **2** (*in chemistry*) indicating material derived by the action of heat; it often indicates an acid formed by loss of a molecule of water in a heating process, and hence also some anhydrides, e.g. pyrophosphate.

pyrocatechol or **pyrocatechin** or (*formerly*) **catechol** 1,2-benzenediol; *o*-dihydroxybenzene. *Compare* **catecholamine**, ***o*-benzoquinone**, **hydroquinone**.

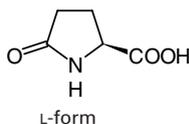

pyrolysis the decomposition or dissociation of a chemical compound by the application of heat. *See also* **thermolysis**. —**pyrolytic adj.**; **pyrolyse** or (*sometimes, US*) **pyrolyze** *vb*.

pyrophosphatase 1 *an imprecise name for inorganic pyrophosphatase*. **2** *the generic name for any enzyme within sub-subclass EC 3.6.1 (enzymes acting on diphosphate bonds); e.g. ATP pyrophosphatase (EC 3.6.1.8).*

pyrophosphate *an older name for diphosphate* (def. 1-5) (use no longer recommended although it is still used as an alternative in such terms as inorganic pyrophosphate, pyrophosphatase, etc.). *See also* **inorganic diphosphate**.

pyrophosphokinase *the general name for any enzyme belonging to the sub-subclass EC 2.7.6, diphosphotransferases, which transfer a diphosphate group from ATP to a named substrate; e.g. GTP pyrophosphokinase (EC 2.7.6.5), which converts guanosine 5'-triphosphate, GTP to guanosine 3'-phosphate 5'-triphosphate, pppGpp.*

pyrrolidonecarboxylic acid *symbol:* <Glp; **pyroglutamic acid**; 5-oxoproline; **pyrrolid-2-one-5-carboxylic acid**. *See* **thyrotropin-releasing hormone**.

1-pyrroline-5-carboxylate dehydrogenase EC 1.5.1.12; an enzyme that catalyses a reaction between 1-pyrroline-5-carboxylate (*abbr.*: P5C), NAD^+ , and H_2O to form L-glutamate and NADH. P5C is an intermediate in the conversion of glutamate, proline, and ornithine. In *Escherichia coli* the protein also has **proline dehydrogenase** activity.

pyrroloquinoline-quinone *abbr.*: PQQ; *an alternative name for methoxatin*.

pyruvate *trivial name for 2-oxopropanoate*, $\text{CH}_3\text{COCOO}^-$; it is found in virtually every type of cell and species, being an important intermediate in many pathways including the catabolism of glucose, and the biosynthesis of amino acids and carbohydrates.

[pyruvate kinase]-phosphotase

pyruvate carboxylase *abbr.*: PCB; EC 6.4.1.1; *systematic name:* pyruvate:carbon dioxide ligase (ADP-forming); *other name:* pyruvic carboxylase; an enzyme of mitochondrial matrix that catalyses a reaction between ATP, pyruvate, and HCO_3^- to form oxaloacetate, ADP, and orthophosphate; biotin and manganese or zinc are cofactors. It requires acetyl-CoA as an allosteric activator. Enzyme deficiency results in lactic acidosis, which may be severe and lethal in infancy, or less severe and lead to delayed development.

pyruvate decarboxylase EC 4.1.1.1; *systematic name:* 2-oxo-acid carboxy-lyase; *other names:* α -carboxylase, pyruvic decarboxylase; α -ketoacid carboxylase. An enzyme that catalyses the decarboxylation of a 2-oxo acid to an aldehyde and CO_2 ; thiamine diphosphate is a coenzyme.

pyruvate decarboxylase kinase or **pyruvate dehydrogenase kinase** a subunit of the mammalian **pyruvate dehydrogenase complex**. It phosphorylates three serine residues on pyruvate dehydrogenase (lipoamide) resulting in loss of activity, and is stimulated by elevated levels of acetyl-CoA and NADH.

pyruvate dehydrogenase complex an enzyme complex that catalyses the overall reaction between pyruvate, NAD^+ , and coenzyme A to form acetyl-CoA, NADH, and CO_2 . The complex consists of four activities: (1) **pyruvate dehydrogenase (lipoamide)**, designated E_1 , catalysing a reaction between pyruvate and lipoamide to form S-acetyldihydroliipoamide and CO_2 ; (2) **dihydroliipoamide S-acetyltransferase**, designated E_2 , catalysing a reaction between S-acetyldihydroliipoamide and coenzyme A to form acetyl-CoA and dihydroliipoamide; (3) **dihydroliipoamide dehydrogenase**, designated E_3 , which oxidizes dihydroliipoamide to lipoamide; and (4) a lipoyl-containing catalytic **protein X**, which can also effect acyl transfer and which binds E_2 and E_3 . The complex is regulated by the phosphorylation and dephosphorylation of the E_1 component, phosphorylation being catalysed by **pyruvate decarboxylase kinase** and dephosphorylation being catalysed by **[pyruvate dehydrogenase (lipoamide)] phosphatase** (or pyruvate decarboxylase phosphatase), EC 3.1.3.43. Elevated levels of NADH and acetyl-CoA inhibit the complex by stimulating the kinase. Defects in E_1 , E_2 , E_3 , and protein X or the phosphatase result in lactic acidosis, which may be fatal early after birth, produce profound psychomotor retardation, or carbohydrate-induced episodic ataxia, depending on the locus of the defect.

pyruvate dehydrogenase (lipoamide) EC 1.2.4.1; *systematic name:* pyruvate:lipoamide 2-oxidoreductase (decarboxylating and acceptor-acylating); *other names:* pyruvate decarboxylase; pyruvate dehydrogenase; pyruvic dehydrogenase. A component enzyme of the **pyruvate dehydrogenase complex**. It catalyses a reaction between pyruvate and lipoamide to form S-acetyldihydroliipoamide and CO_2 ; thiamine diphosphate is a coenzyme. The enzyme in humans consists of two α (41 kDa each) and two β (36 kDa each) subunits. The α subunit is catalytic and binds the pyrophosphate end of the thiamine pyrophosphate, while the β subunit binds the thiazolidine ring of the coenzyme. Numerous mutations (mostly derived *de novo* in the gene on the X chromosome) in the α subunit result in enzyme deficiency and severe lactic acidosis.

[pyruvate dehydrogenase (lipoamide)]-phosphatase EC 3.1.3.43; an enzyme that catalyses the hydrolysis of phosphate from [pyruvate dehydrogenase (lipoamide)] phosphate. This hydrolysis activates the enzyme activity. Enzyme deficiency leads to inactivation of the α subunit of the appropriate dehydrogenase and consequent lactic acidosis.

pyruvate kinase EC 2.7.1.40; *systematic name:* ATP:pyruvate 2-O-phosphotransferase; *other names:* phosphoenolpyruvate kinase; phosphoenol transphosphorylase. An enzyme that catalyses the formation of pyruvate and ATP from phosphoenolpyruvate and ADP; it requires Mg^{2+} and K^+ . In the glycolytic pathway, it effects the second phosphorylation of ADP to ATP. In many cases the enzyme is a homotetramer. In humans there are two genes for the enzyme: PKLR, which is expressed in liver and erythrocytes, and PKM, which is expressed in muscle and other tissues. Numerous mutations in PKLR result in an autosomal recessive form of hemolytic anemia.

[pyruvate kinase]-phosphatase EC 3.1.3.49; an enzyme that

catalyses the hydrolysis of phosphate from [pyruvate kinase] phosphate in order to activate pyruvate kinase.

pyruvate–malate cycle a metabolic cycle involving malate dehydrogenase (oxaloacetate-decarboxylating) (the **malic enzyme**) that occurs during fatty-acid biosynthesis. In this situation, acetyl-CoA is transported into the cytoplasm as citrate, formed by mitochondrial citrate synthase; the citrate is cleaved in the cytoplasmic compartment to acetyl-CoA, which participates in fatty-acid synthesis, and oxaloacetate. No transport system exists for taking this oxaloacetate back into the mitochondrion; however, it can be reduced

to malate by cytoplasmic NAD⁺-linked malate dehydrogenase, and the malate so formed can be converted to pyruvate by malic enzyme, EC 1.1.1.38; the pyruvate can then be transported into the mitochondrion, to be carboxylated to oxaloacetate by **pyruvate carboxylase**.

pyruvic–malic carboxylase *an alternative name for malic enzyme.*

python *see programming language.*

PYY *abbr. for peptide YY.*

PZ *abbr. for pancreozymin.*

PZP *abbr. for pregnancy zone protein.*

Qq

q symbol for quartet (in nuclear magnetic resonance spectroscopy).
q symbol for **1** heat (alternative to *Q*). **2** partition function (individual entity). **3** specific humidity.

Q symbol for **1** a residue of the α -amino acid L-glutamine (alternative to Gln). **2** a residue of the ribonucleoside **pseudouridine** (replacing Ψ for computer work). **3** coenzyme Q (i.e. **ubiquinone**); not recommended. The number of prenyl residues may be indicated by a suffix arabic number, e.g. Q-10. **4** queuosine.

Q symbol for **1** heat (alternative to *q*). **2** electric charge. **3** radiant energy (alternative to *W*). **4** or **Q**, quantity of light. **5** partition function (whole system).

Q₁₀ symbol for temperature coefficient of a reaction.

Q_{CO2} symbol for metabolic quotient in respect of discharge of carbon dioxide; it is expressed in terms of microlitres CO₂ evolved per milligram dry mass of material per hour.

Q_{O2} symbol for metabolic quotient in respect of uptake of dioxygen; it is expressed in terms of microlitres O₂ absorbed per milligram dry mass of material per hour.

Q_S symbol for a measure of the activity of an enzyme, especially a respiratory enzyme, defined as the number of microlitres (at *stp*) of gaseous substrate S used up per hour per milligram enzyme. It could be extended to nongaseous substrates by taking 1 μ mol as equivalent to 22.4 μ L.

QAE *abbr.* for the quaternized aminoethyl; denoting the group diethyl-(2-hydroxypropyl)aminoethyl; (C₂H₅)₂(CH₃-CHOH-CH₂)N⁺-CH₂-CH₂-; a strongly basic substituent sometimes used in hydroxylated chromatographic support matrices, as in QAE-Sephadex, to form anion exchangers. *Compare* DEAE.

Q cycle an alternative name for **protonmotive Q cycle**.

Q enzyme an alternative name for amylopectin branching enzyme; *see* **branching enzyme**.

Q gas a mixture of 98.7% helium and 1.3% butane, used as filling for gas-flow Geiger counters.

QH• symbol for ubisemiquinone.

QH₂ symbol for ubiquinol.

Q repeat an alternative name for **glutamine repeat**.

QTL *abbr.* for quantitative trait locus.

quad denoting four kinetically important substrates or products in an enzyme mechanism. *See* **reactivity of enzymes**.

quadri+ or (sometimes) **quadr+** or (before a vowel) **quadr+** *comb. form* four; fourth or one-fourth; square.

quadruplex DNA another name for **tetraplex DNA**.

quadrupole mass spectrometer A type of **mass spectrometer** in which the molecular ions are separated by mass filter comprising four metal rods with an alternating high frequency voltage (quadrupole field).

quadrupole, nuclear electric *see* **nuclear quadrupole moment**.

quality factor or (formerly) **relative biological effectiveness** an index of the ability of a given type of ionizing radiation to cause biological damage, depending on the density of the ionization produced relative to that produced by gamma radiation. For all X- (and gamma) radiation and beta particles (+ or -) likely to be encountered in the use of radioisotopes it is assigned a value of unity, for thermal neutrons usually a value of 3, and for all alpha particles a value of 10. *See also* **dose equivalent**.

quanta the plural of **quantum**.

quantal 1 of, pertaining to, or being a **quantum** or something that is quantized; of or pertaining to the quantum theory. **2** of a biological effect or response in which there are only two categories, conditions, or states (e.g. all or none, alive or dead). —**quantally** *adv.*

quantitative electrophoresis (sometimes) an alternative name for **crossed immunoelectrophoresis**.

quantitative trait locus *abbr.*: **QTL**; a region of a chromosome containing genes that are believed to make a significant contribution to the expression of a complex phenotypic trait. Quantitative traits (QTs) are typically affected by more than one gene and by the environment, and include several medically significant traits (e.g.

blood pressure, obesity). Once mapped to small chromosomal regions (e.g. using linkage maps), specific genes can be isolated by other molecular methods.

quantity or physical quantity (*in systems of measurement*) any property whose value can be expressed as the product of a numerical value and a unit. In the International System of Units (*see* **SI**) there are seven **base quantities**, physical quantities regarded as being dimensionally independent; these are: length, mass, time, electric current, thermodynamic temperature, amount of substance, and luminous intensity; all are arbitrarily defined. **Derived units** are expressed algebraically in terms of the base units. Symbols for physical quantities are printed in italic type; they are generally single Roman or Greek letters, and may be lower case or capital.

quantity of electricity an alternative name for **electric charge**.

quantize or quantise to restrict (a physical quantity) to a set of discrete values, characterized by quantum numbers. A quantized physical quantity cannot vary continuously but must change in steps.

—**quantization or quantisation** *n.*

quantum (*pl.* **quanta**) **1** a (specific) quantity or amount of something. **2** a unit amount of a physical quantity, especially of electromagnetic energy, such that all other amounts are integral multiples of it. According to the **quantum theory**, a quantum of energy released during radiation emission or taken up during radiation absorption is equal to $h\nu$, where h is the Planck constant and ν the frequency of the radiation in hertz. A quantum of light (or other electromagnetic energy) is termed a **photon**.

quantum efficiency 1 (*in a luminescent system*) the fraction of the molecules in a particular excited state that emit luminescence. **2** (*in biochemistry*) an alternative term for **quantum yield** (def. 1).

quantum mechanics a mathematical theory developed from the quantum theory (*see* **quantum**) as a replacement for classical mechanics in order to explain satisfactorily the behaviour of atoms, molecules, and elementary particles in terms of observable quantities such as the intensities and frequencies of spectral lines.

quantum number any of a set of small integral or half-integral numbers that give the various possible values of a quantized property of a system. Quantum numbers are used especially in describing the properties of elementary particles, such as their charge (values of 0, +1, or -1) or spin (values of +1/2, or -1/2), and in specifying the energy states of electrons in atomic orbitals (each of which is characterized by a unique set of four quantum numbers).

quantum requirement (*in photosynthesis*) the inverse of **quantum yield** (def. 2); i.e. the number of quanta of light energy required to bring about the release of one molecule of dioxygen. The theoretical value is eight, but the value observed in an experimental system is generally somewhat higher, depending on conditions.

quantum theory *see* **quantum**.

quantum yield 1 *abbr.*: **Q**; (*in a luminescent system*) the probability of luminescence occurring in given conditions, expressed by the ratio of the number of photons, i.e. quanta of light, emitted by the luminescing species to the number absorbed. *Compare* **quantum efficiency**. The measurement of **Q** requires the counting of photons, because

$$Q = \text{photons emitted/photons absorbed.}$$

It requires highly specialized instrumentation, but a less rigorous method may be employed in which the fluorescence of a fluor is compared with that of a fluor of known **Q**. Then

$$Q_x = [I_x Q_s A_s] / [I_s A_x]$$

where Q_s is the quantum yield of the standard, I_s and I_x are the fluorescence intensities of the sample and standard and A_s and A_x are the percentage of absorption of each solution at the exciting wavelength. **2** (*in photosynthesis*) the inverse of **quantum requirement**; i.e. the fractional number of molecules of carbon dioxide reduced per photon absorbed.

quartz a colourless, often transparent, glassy form of silica, SiO₂,

used in optical devices and cuvettes because of its transparency to near-ultraviolet radiation. It is enantiomorphous, the right- and left-handed forms rotating the plane of polarized light in opposite directions.

quasi-species (*in virology*) the population of closely related but different viral genomes that evolves over time through spontaneous mutations within an individual infected with a single genotype. Diversification through the emergence of quasi-species is one mechanism by which viruses evade the host immune response.

quaternary 1 consisting of four (items, parts, etc.); by or in fours. **2** (*in chemistry*) consisting of or containing an atom bound to four atoms or groups. **3** of the fourth order; fourth in a series or hierarchy.

quaternary ammonium compound any compound that can be regarded as derived from ammonium hydroxide or an ammonium salt by replacement of all four hydrogen atoms of the NH_4^+ ion by organic groups. Certain compounds of this class – ones in which one of the organic groups is a long-chain ($\text{C}_8\text{--C}_{18}$) alkyl group and the other three are shorter-chain alkyl or other groups – have the properties of cationic detergents and are powerful antimicrobial agents. They are bacteriostatic at low concentrations and bactericidal at higher concentrations, being generally more active against Gram-positive than Gram-negative organisms. They display relatively low toxicity to higher animals and humans, and hence are widely used as antiseptics and disinfectants.

quaternary structure the fourth order of complexity of structural organization exhibited by protein, nucleic acid, and nucleoprotein molecules. It refers to the arrangement in space of the subunits of a multimeric macromolecule, and the ensemble of its intersubunit contacts and interactions, without regard to the internal geometry of the subunits. Hence, it is possessed only when the molecule in question is made up of at least two (identical or non-identical) subunits that are (at least potentially) separable, i.e. are not linked by covalent bonds.

Quellung reaction or **Neufeld Quellung reaction** or **pneumococcus capsule swelling reaction** the swelling of the capsule observed when specific antibody is mixed with suitable bacterial cells (e.g. pneumococci). It is probably due to deposition of antibody on the outside of the capsule, making the latter clearly visible. [From the German, *Quellung*, swelling; described by Ferdinand Neufeld (1869–1945), German bacteriologist, in 1902.]

quench correction (*in liquid-scintillation counting*) a correction to be applied to an observed count rate to allow for losses resulting from **quenching** (def. 2).

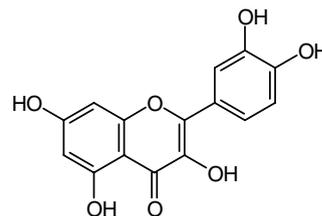

quenched flow *see rapid-reaction kinetics*.

quencher a substance capable of reducing or destroying luminescence through deactivation of an excited chemical species. In biological systems this usually occurs by chemical reaction (e.g. complex formation), by exchange of energy on collision, or by resonance energy transfer.

quenching 1 the reduction or destruction of luminescence, especially fluorescence, of a sample by addition or inclusion of a **quencher**. Fluorescence quenching is the basis of a useful technique for studying the binding of small molecules to proteins or other macromolecules. **2** the reduction by whatever means of the efficiency of energy transfer from beta particles to the photomultiplier(s) in a liquid-scintillation counter. Such means include: (1) **dilution quenching** – reduction of the probability of scintillation occurring through dilution of the scintillator by the sample; (2) **chemical** (or **impurity**) **quenching** – absorption by a component of the sample of some of the energy of the beta particles without emitting photons, or (without fluorescing and in competition with the primary fluor) of some of the photons emitted by excited solvent molecules; and (3) **colour quenching** – absorption by a coloured component of the sample of some of the photons emitted by the secondary fluor. **3** the termination of a chemical or enzymic reaction by addition of another reagent or sudden change of the conditions.

quercetin 3,3',4',5,7-pentahydroxyflavone; a member of the **flavonoids**, or **flavones**, widely distributed in plants, often as **glycosides**; it is the aglycon of **quercitrin**, **rutin**, and other materials. Known in folk medicine for its anti-inflammatory properties, it inhibits the **lipoxigenase** pathway, has some antiplatelet and anti-

thrombotic activity *in vivo*, inhibits mast-cell degranulation, and possesses anti-asthmatic activity. It inhibits many enzymes, including protein kinases, and also inhibits DNA, RNA, and protein synthesis. A number of its actions may reflect its property as a nucleoside antagonist.

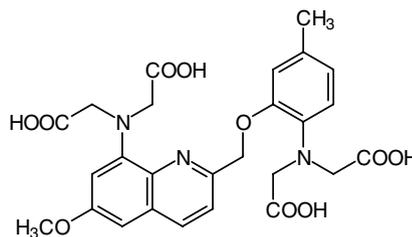

quercitrin quercetin-3-L-rhamnoside. *See also quercetin*.

query sequence (*in bioinformatics*) a sequence used as a probe to search a database.

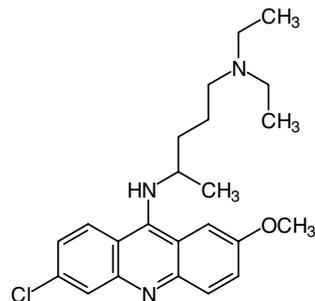

queuosine *symbol*: Q; any one of a series of nucleosides found in tRNA and having an additional pentenyl ring added via an NH group to the methyl group of 7-methylguanosine. The pentenyl ring may carry other substituents.

Qui *symbol for a residue* (or sometimes a molecule) of the deoxyaldohexose **quinovose**.

Quin-2 *abbr. for* 2-[(2-amino-5-methylphenoxy)methyl]-6-methoxy-8-aminoquinoline-*N,N,N',N'*-tetraacetic acid; a molecule functionally related to the Ca^{2+} -chelating agent **EGTA**, but containing fluorescent groups. The quantum yield of fluorescence is greatly enhanced on binding Ca^{2+} , leading to its use as a quantitative indicator of Ca^{2+} concentration. It is normally used as its tetraacetoxy ester, which readily crosses the plasma membrane and is then hydrolysed within the cell by esterases to Quin-2, the polar nature of which causes it to be retained as an intracellular indicator. *See also Fura-2, INDO-1*.

quinacrine or **mepacrine** or **atebrine** 6-chloro-9-(4-diethylamino-1-methylbutylamino)-2-methoxyacridine; a derivative of **acridine**, formerly used as an antimalarial and anthelmintic. It fluoresces powerfully in UV light and can be used as a fluorochrome to label DNA in chromosomes.

quinacrine mustard a compound derived by chloro-substitution of the terminal methyls of **quinacrine** ethylamino groups, and possess-

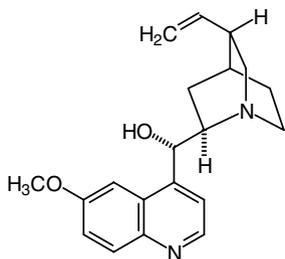

ing properties of an alkylating agent; this enhances its value as a DNA-labelling agent.

quinhydrone an addition compound of one mole each of hydroquinone and *p*-benzoquinone. It is a reddish-brown crystalline substance with a dark-green lustre, useful as an antioxidant, in photography, and as a redox system in the **quinhydrone electrode**.

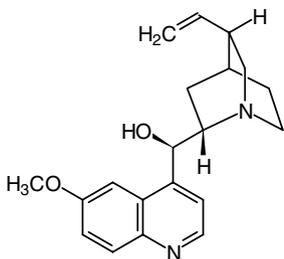

quinhydrone electrode a half-cell consisting of a bright platinum (or sometimes gold) electrode immersed in a test solution to which has been added a little **quinhydrone**. It has an electric potential related to the pH value of the solution and thus is useful as a secondary hydrogen electrode for the electrometric measurement of pH.

quinic acid the D enantiomer (1 α ,3 α ,4 α ,5 β)-1,3,4,5-tetrahydroxycyclohexanecarboxylic acid occurs commonly in plants, either free or as esters (e.g. **chlorogenic acid**), and may make up as much as 2–10% of the dry weight of leaves. It may be formed by the **shikimate pathway**. Its catabolism to protocatechuic acid has been extensively studied in *Aspergillus nidulans* and *Neurospora crassa*.

quinidine β -quinine; 6'-methoxycinchonan-9-ol; a stereoisomer of **quinine** noted for its cardiac anti-arrhythmic effects.

quinine 6'-methoxycinchonan-9-ol; a bitter-tasting alkaloid obtained especially from the bark of cinchona, any of a number of trees or shrubs of the tropical genus *Cinchona* (especially the Javan species *C. lidgeriana* and various South American species). It was formerly much used (and sometimes is still needed) for the prevention and treatment of malaria. It binds to the DNA of the malarial parasite *Plasmodium* spp., and is thought thereby to inhibit biosynthesis of the parasite's nucleic acids. Quinine and drinks containing it (e.g. tonic water) help to prevent cramp. *Compare* **quinidine**.

quinoid or **quinonoid** of, derived from, or resembling a **quinone** (def. 2).

quinol an alternative name for **hydroquinone**.

quinolinic acid or **pyridine dicarboxylic acid** a degradation product of tryptophan that, as the substrate for quinolate phosphoribosyltransferase, is the precursor of nicotinate mononucleotide in the biosynthesis of the coenzymes NAD and NADP.

4-quinolone antibiotic a generic term for any of a wide range of synthetic antibacterial compounds whose molecular structures contain a 4-oxo-1,4-dihydroquinoline or a 4-oxo-1,4-dihydrocinnoline nucleus; e.g. **cinnoxacin**, **ciprofloxacin**, **nalidixic acid**, **oxolinic acid**. Their antibiotic activity derives from interaction with the A subunit of bacterial DNA gyrase (see type II **DNA topoisomerase**); this results in trapping of bacterial DNA in the complex it forms with the A subunit. Rejoining of the DNA strands broken by the enzyme is thereby arrested.

quinone 1 a common name for ***p*-benzoquinone**. **2** any member of a class of diketones derivable from aromatic compounds by conversion of two CH groups into CO groups with any necessary rearrangement of double bonds. Simple quinones are usually *p*-quinones, i.e. derivatives of *p*-benzoquinone (*compare* **hydroquinone** (def. 2)), but they may also be *o*-quinones, i.e. derivatives of *o*-benzoquinone (*compare* **catechol** (def. 2)). Naturally occurring quinones form a large, varied, and widespread group of compounds; they include numerous pigments, various electron carriers (e.g. **plastoquinone**, **ubiquinone**), and vitamins K. *See also* **semiquinone**.

+quinone comb. form denoting a **quinone** (def. 2); e.g. benzoquinone, anthraquinone, naphthoquinone.

quinone cofactor see **quinoprotein**.

quinonoid an alternative term for **quinoid**.

quinoprotein other name: quinoenzyme; any enzyme protein that contains a **quinone cofactor**, i.e. the freely dissociable pyrroloquinoline quinone (PQQ) or methoxanthin, or the covalent species topaquinone (TPQ), tryptophan tryptophylquinone (TTQ), or lysine tyrosylquinone (LTQ) that are derived by post-translational modification of certain proteins. PQQ is characteristic of oxidoreductase enzymes within the sub-subclass EC 1.1.99, which includes alcohol dehydrogenase (acceptor) (EC 1.1.99.8) of methylotrophic bacteria, glucose dehydrogenase (pyrroloquinoline-quinone) (EC 1.1.99.17), and a number of dehydrogenases acting on other specified (types of) alcohols or polyols. TPQ occurs in bovine serum copper amine oxidase, TTQ in bacterial amine dehydrogenase, and LTQ in bovine aorta lysyl oxidase (EC 1.4.3.13).

quinovosamine 2-amino-2,6-dideoxy-D-glucose; an amino derivative of **quinovose** present in bacterial polysaccharides.

quinovose symbol: Qui; a trivial name for 6-deoxy-D-glucose. α -Quinovose occurs, e.g., as its 6-sulfo derivative (6-deoxy- α -D-glucopyranosyl 6-C-sulfate) in the sulfoquinovosyl diacylglycerols, which form one of the two major groups of the glycerolipids of chloroplasts. The sulfoquinovosyl derivative also occurs in some **cardiac glycosides**.

quinternary structure the arrangement of separate molecules in macromolecular complexes, such as in protein-protein or protein-nucleic acid interactions.

quisqualate receptor see **α -amino-3-hydroxy-5-methyl-isoxazolepropionic acid receptor**.

quorum sensing the process by which bacteria detect their population cell density and use the information to regulate gene expression accordingly.

Rr

r **1** *symbol for ribo+* (def. 1); it is used as a prefix in (one- or three-letter) symbols for ribonucleosides for emphasis or clarity, especially to distinguish from 2'-deoxyribonucleosides. **2** *symbol for reaction*. **3** *abbr. for rat* (as a prefix to an abbreviation for the name of a peptide hormone); denoting derived (or as if derived) from a rat or rats; e.g. rGH.

r *symbol for 1* concentration ratio. **2** rate of concentration change. **3** radius. **4** interatomic distance.

R *symbol for 1* a residue of the α -amino acid L-arginine (alternative to Arg). **2** a residue of an incompletely specified base in a nucleic-acid sequence that may be either adenine or guanine. **3** a residue of an unspecified purine nucleoside (alternative to Puo). **4** an unspecified univalent group in a formula of an organic compound. The group must be attached by means of carbon and derived from an aliphatic, carbocyclic, or heterocyclic compound. Up to three such groups, when different, may be designated R, R', and R'', or R¹, R², and R³; for more than three such groups, superscript numerals only should be used. **5** röntgen (a non-SI unit of radiation exposure). **6** resonance effect (in electron displacement).

R *symbol for 1* electric resistance. **2** thermal resistance. **3** gas constant. **4** molar refraction.

R *stereochemical descriptor* denoting *rectus*; i.e. the absolute configuration of a chiral compound in which the priority (obtained using the Cahn–Ingold–Prelog sequence rules) of the substituent groups on the chiral centre decreases in a clockwise (right-handed) direction. For use as a prefix in chemical nomenclature, the descriptor is placed in parentheses and connected with a hyphen, e.g. (*R*)-alanine. For chiral compounds in which the relative but not the absolute configuration is known, *rectus* configuration is denoted by the prefix (*R*^{*}). See **sequence rule**. Compare **S**.

R_B *symbol for R_B value*.

R_f or **R_F** *symbol for R_f value*.

R_p *symbol for phosphorylation state ratio*.

R_s *symbol for saturation ratio*.

RAB a gene encoding a Rab protein – any of a family of GTP-binding proteins similar to Ras proteins (see **RAS**) and probably involved in membrane traffic, etc. Rab proteins contain dicysteine motifs near their C termini to receive a geranylgeranyl moiety.

rabbit aorta-contracting substance *abbr.*: RCS; a name given (in 1969) to an unstable factor released from guinea-pig lung that caused contraction of isolated strips of rabbit aorta. The activity was probably due to the presence of thromboxane A₂ (see **thromboxane**).

rabbit reticulocyte system a cell-free system, from lysed rabbit reticulocytes, that translates added eukaryote mRNAs from a wide variety of heterologous sources. Endogenous mRNA is destroyed using a Ca²⁺-dependent ribonuclease, micrococcal endonuclease; this enzyme is inactivated by adding EGTA. Heterologous mRNA is then added and is translated by the system.

rac *abbr. for racemo-*.

Rac either of two RhoGTPases that are cytosolic components of the phagocyte NADPH oxidase system, Rac 1 and Rac 2, which show 92% homology. They are involved in activation of MAP kinase and JNK kinases by integrins.

RACA *abbr. for remodelling and anchoring of chromosome A*; a protein of *Bacillus subtilis* and related spore-forming species that anchors the origin of replication regions of sister chromosomes to the cell poles during sporulation.

RACE *abbr. for rapid amplification of cDNA ends*; a variation on the polymerase chain reaction designed for amplification of sequence corresponding with the 5' or 3' ends of specific mRNAs. The former is important for the location of the transcription start site as well as providing full-length cDNA sequences.

racemase any enzyme that interconverts the two enantiomers of a chiral compound; such enzymes are categorized in subclass EC 5.1 (which also includes **epimerases**). If more than one chiral centre is present, a racemase must invert configuration of all the chiral centres.

Thus, the name methylmalonyl-CoA racemase, sometimes used for methylmalonyl-CoA epimerase (EC 5.1.99.1), is incorrect – the enzyme does not change configurations of the chiral centres of the CoA moiety.

racemate any homogeneous phase containing equimolar amounts of enantiomeric molecules.

racemic *symbol*: (±)- or (formerly) *dl-*; denoting the presence of equimolar amounts of the dextrorotatory and levorotatory enantiomers of a compound, regardless of whether the (optically inactive) product formed is crystalline, liquid, or gaseous. A homogeneous solid phase composed of equimolar amounts of enantiomeric molecules is termed a **racemic compound**, and a mixture of equimolar amounts of enantiomeric molecules present as separate solid phases is termed a **racemic mixture**; see also **racemate**. A (±)-product may be resolved into its (+)- and (–)-components. The term is derived from **racemic acid** [from Latin *racemus*, bunch of grapes], the optically inactive mixture of (+)- and (–)-tartaric acids sometimes found during the manufacture of wine. By extension, the term is applied to DL- and (RS)-mixtures. See **D/L convention**, **optical isomerism**, **sequence rule**. See also **racemo-**.

racemize or **racemise** to induce the formation of a mixture of the two possible enantiomers from one of the pure isomers of a chiral compound. —**racemization** or **racemisation** *n*.

racemo- *abbr.*: *rac-*; *prefix (in chemical nomenclature)* designating a racemate. It may be used as an alternative to the symbol (±)- or (for certain classes of racemic compounds) the symbol DL-. Compare **meso-**.

rachitic of, pertaining to, or afflicted with **rickets**.

rachitis an alternative name for **rickets**.

rachitogenic tending to cause **rickets**.

rad 1 *symbol for radian*. **2** *symbol*: rad or (to avoid possible confusion with **rad** (def. 1)) rd; the cgs unit of absorbed dose of ionizing radiation, equivalent to an absorption of 0.01 joule of energy per kilogram (= 100 ergs per gram) of irradiated material. Whereas the rad represents, in practice, about the same amount of energy as the **röntgen** (the exact equivalence depending on the material irradiated), it applies to any type of ionizing radiation in any medium. 1 rad = 0.01 Gy. **3** *abbr. for radiation*.

radial 1 of, resembling, or relating to a radius or ray; in rays. **2** emanating from the centre of a circle or a common central point. **3** spreading out uniformly in all directions on a surface. —**radially** *adv*.

radian *symbol*: rad; the SI supplementary unit of plane angle. One radian is equal to the angle subtended at the centre of a circle by an arc whose length is equal to the radius. It is dimensionless. There are 2 π radians in a circle; 1 rad \approx 57.295 78°.

radiant energy *symbol*: *Q* or *W*; the energy of any form of electromagnetic radiation. The SI derived unit is the **joule**.

radiant intensity *symbol*: *I*; the **radiant power** of radiation from a point source per unit of solid angle; i.e. $I = d\Phi/d\Omega$, where Φ is the radiant power and Ω is the solid angle measured in steradians. The SI unit is the watt per steradian (Wsr⁻¹).

radiant power or **radiant flux** *symbol*: *P* or Φ ; the rate of flow of energy of radiation; i.e. $\Phi = dQ/dt$, where Q is the radiant energy. The SI derived unit is the watt.

radiation 1 the emission of energy from a source and its transmission as particles, rays, or waves, especially as electromagnetic rays or waves, sound waves, or streams of subatomic particles. **2** energy so transmitted, especially the corpuscular and electromagnetic rays emitted in the decay of radionuclides. **3** **ionizing radiation**. **4** divergence from a common point, especially radially from a central point or source.

radiation absorbed dose see **absorbed dose**, **rad** (def. 2).

radiation biology an alternative name for **radiobiology**.

radiation-chemical reaction any chemical reaction that is initiated by the absorption of radiation but is distinguishable from a **photochemical reaction** by its lack of specificity (i.e. by giving rise to a

variety of reaction products) and by occurring at higher radiation energies (i.e. by absorption either of electromagnetic radiation from the mid-ultraviolet region onwards or of high-energy particulate radiation) and thus by resulting always in the formation of detectable ions.

radiation chemistry the branch of chemistry concerned with **radiation-chemical reactions**. *Compare radiochemistry.*

radiation damage the totality of the harmful changes induced in a cell or tissue by radiation. The harmful effects may include formation of **thymine dimers** in DNA or of radicals from polyunsaturated acyl groups in lipids.

radiation dose equivalent *see* **dose equivalent**.

radiation hybrid map *abbr.*: RH map; a map of irradiated chromosomal sites derived from hybrid cells containing fragments of irradiated chromosomes. RH maps provide important markers, allowing the construction of precise sequence-tagged site (STS) maps (with the STSs positioned according to their frequency of separation by radiation-induced breaks). These are useful in ordering genetic loci along chromosomes and in studying multifactorial diseases.

radiation inactivation method a technique, based on **target theory**, that enables the size of the functional unit of a biologically active macromolecule (or of its complexes with other molecules) to be estimated; it can be used on unpurified (e.g. membrane-bound) material. Determinations are made of the biological activity remaining in a sample after exposure to various large doses of ionizing radiation (electrons or X- or gamma radiation of at least 1 MeV), and the value, D_{37} , of the radiation dose, expressed in Mrad, required to reduce the activity to 37% of (i.e. e^{-1} times) its original value is obtained; the relative molecular mass, M_r , of such a macromolecule may then be found from the empirical relationship $M_r = 6.4 \times 10^5/D_{37}$, where D_{37} is determined at 30°C.

radiation source a quantity of radioactive material used as a source of ionizing radiation.

radical (*in chemistry*) **1** any molecular entity, charged or uncharged, that possesses an unpaired electron (but normally excluding any paramagnetic metal ion); often formed by homolysis of a covalent bond. Radical character is indicated in a formula by a centred dot symbolizing the unpaired electron and placed (if possible) beside the symbol for the atom of highest spin density; e.g. $\text{HOO}\cdot$, $\cdot\text{CH}_3$. The term **free radical** is now preferably restricted to any radical that does not form part of a **radical pair**. **2** a former name for **group** (def. 2).

radical anion *see* **radical ion**.

radical cation *see* **radical ion**.

radical centre the atom in any polyatomic **radical** (def. 1) on which the unpaired electron is largely localized.

radical ion any **radical** (def. 1) that carries an electric charge. One carrying a negative charge is termed a **radical anion** (e.g. the benzene radical anion, $\text{C}_6\text{H}_6\cdot^-$); one carrying a positive charge is termed a **radical cation** (e.g. the benzene radical cation, $\text{C}_6\text{H}_6\cdot^+$).

radical pair **1** any two **radicals** (def. 1) in close proximity in liquid solution, with a solvent cage. They may have been formed simultaneously, e.g. by homolysis, or have come together by diffusion. Whilst together, correlation of their unpaired electron spins occurs and manifests itself as a distortion of nuclear magnetic resonance spectra. **2** a cation and anion radical produced transiently in the primary photochemical process of photosynthesis. *See photosystem.*

radical SAM refers to enzymes that bind S-adenosyl-L-methionine (SAM) next to a [4Fe-4S] cluster to generate a reactive free-radical species.

radical scavenger any substance that can react readily with, and thereby eliminate, radicals. In biological systems or materials, radical scavengers may function as **antioxidants** or may protect from damage by ionizing radiation. Among the important radical scavengers that function in animal tissues at physiological concentrations are the water-soluble substances ascorbate, glutathione, and the purine bases, and the fat-soluble substances tocopherols, the retinols, the carotenes, and the ubiquinones.

radioactivate to convert a stable nucleus into one undergoing radioactive decay by bombardment with high speed particles, including protons, alpha particles, neutrons, and deuterons. These are formed in a cyclotron or synchrotron from a radioactive source,

and accelerated through a potential difference of a few thousand volts by a magnetic field before being focused on the substance to be converted.

radioactivation analysis or **activation analysis** a method for the qualitative and/or quantitative estimation of the chemical elements in a sample. It depends on the identification and determination of the radionuclides formed when the sample is bombarded with neutrons or other particles.

radioactive having the properties associated with a **radioactive isotope**.

radioactive concentration the **activity** (def. 2) per unit quantity of any material in which a **radionuclide** occurs. *See also specific activity.*

radioactive decay *see* **decay** (def. 1b).

radioactive isotope or **radioisotope** any isotope of a chemical element whose nucleus is unstable and emits alpha, beta, or gamma rays. The product is another element, which may be stable or unstable; if the latter, it decays further. Thus, the principal isotope of uranium, ^{238}U , emits an alpha particle and decays to ^{234}Th , which emits a beta particle forming ^{234}Pa ; this chain continues to the formation of ^{206}Pb , which is stable.

radioactive label or **radiolabel** a **radioactive isotope** incorporated into a molecule to confer on it the property of radioactivity.

radioactive tracer or **radiotracer** a radioactive substance that is added to a metabolic system in quantities (mass) too small to perturb the system, in order to follow, by isolating the radioactive intermediates formed, the sequence of transformations undergone normally by the same (nonradioactive) molecule under similar conditions.

radioactivity **1** the emission of radiation from certain **nuclides** by the spontaneous transformation of their **nuclei**. **2** (*loosely*) the radioactive material itself or its emitted radiation. *See activity* (def. 2).

radioallergosorbent test *abbr.*: RAST; a test used primarily for quantifying the levels of antigen-specific immunoglobulin E (IgE) in serum. A specific allergen, which has been covalently coupled to an insoluble **Sephadex** carrier, is incubated with serum containing the unknown amount of IgE. The carriers are then washed and further incubated with radiolabelled antibodies to IgE, the amount of radioactivity bound being a measure of the amount of IgE. The advantage of this method over the **radioimmunosorbent test** is that IgE specific to a particular antigen can be selectively quantified.

radioassay any type of **assay** in which a radioactive isotope is used in the measurement. The term embraces, e.g., **immunoradiometric assay**, **radioimmunoassay**, and competitive protein-binding assay.

radioautogram or **radioautograph** or **autoradiogram** the pattern formed after development of an X-ray film that has been exposed to a paper, gel, or thin-layer chromatogram containing radioactive compounds.

radioautograph **1** an alternative term for **radioautogram**. **2** to prepare a radioautogram. —**radioautography** *n.*

radiobiology or **radiation biology** the study of the interaction between radiation and biological material.

radiocarbon any radioactive isotope of carbon, usually carbon-11 or carbon-14.

radiochemical purity *abbr.*: RCP; the proportion of the total **activity** (def. 2) that is present in the stated chemical form in a radioactive material.

radiochemistry the branch of chemistry concerned with the compounds of radioactive nuclides. *Compare radiation chemistry.*

radiochromatogram a chromatogram of substances some or all of which contain a radioactive isotope.

radiofrequency radiation electromagnetic radiation encompassing wavelengths in the region 1 mm (300 GHz) to 30 km (10 kHz) (frequencies in parentheses). This range includes microwave radiation and lies above that of infrared radiation.

radiography the use of X-rays to examine the internal structures of a body. An X-ray film is placed behind the body, through which X-rays are passed. After exposure, there are areas of the film in which development has not occurred due to absorption of the X-rays by structures of the body, thus yielding a pattern of these structures. —**radiographer** *n.*; **radiographic** *adj.*; **radiographically** *adv.*

radioimmunoassay *abbr.*: RIA; a highly sensitive method of assay of nonradioactive material. A known amount of antibody (Ab) di-

rected against the substance (antigen, Ag) to be assayed is saturated with a mixture of Ag and radioactive Ag (Ag*), so that total Ag (Ag + Ag*) is in excess. When nonradioactive Ag is added to Ab along with Ag*, Ag and Ag* compete for binding to Ab, so that less Ag* will be found in the antibody-antigen complex as the ratio Ag:Ag* increases. If the antibody-antigen complex is then separated from free antigen, the total amount of antigen (the substance being assayed) can be calculated from the ratio Ab-Ag*:Ag* and the known **titre** of antibody. It is often convenient to attach the antigen to plates so that the amount of ligand bound to the plate is proportional to the amount of test antibody.

radioimmunosorbent test *abbr.*: RIST: a test used primarily for quantifying total serum immunoglobulin E (IgE) levels. Antibodies specific for IgE, covalently linked to an insoluble dextran, are incubated first with a known amount of radiolabelled IgE and then with the serum containing the unknown amount of IgE. From the decrease in the amount of radiolabel bound to the immobilized antibodies, due to competition by the unlabelled IgE in the serum, the total amount of IgE in the serum can be estimated.

radioiodinate to incorporate one or more atoms of **radioiodine** (usually iodine-125 or iodine-131) into a molecule.

radioiodine any radioactive isotope of **iodine**, notably iodine-125 (half-life 60 days) and iodine-131 (half-life 8 days).

radioisotope a **radioactive isotope**.

radiolabel 1 a **radioactive label**. **2** to incorporate a radiolabel.

radioligand any **ligand** containing a radioactive isotope; *see also* **Scatchard plot**.

radiology the study and use of radiation and radioactive substances, especially in the diagnosis and treatment of disease. It includes the use of diagnostic X-rays in **radiography**, the therapeutic use of ionizing radiation to treat disease (**radiotherapy**), and the experimental and diagnostic use of radioisotopes introduced into the body. —**radiological** *adj.*; **radiologically** *adv.*; **radiologist** *n.*

radiolysis the cleavage of chemical bonds by high-energy radiation. —**radiolytic** *adj.*; **radiolyse** *vb.*

radiometer 1 any instrument used to measure radiant energy. **2** **Crookes radiometer** a specific type of radiometer in which the different behaviour of a polished surface, which reflects energy, and a blackened surface, which absorbs it, is utilized to cause a rotor to turn at a rate related to the intensity of radiation. [After William Crookes (1832–1919), British chemist and physicist.] —**radiometric** *adj.*; **radiometry** *n.*

radiomimetic 1 describing any drug or other chemical substance, typically an alkylating agent, whose effects in living systems (e.g. carcinogenic, immunosuppressive, mutagenic) resemble those produced by **ionizing radiation**; more loosely, describing any such agent able to cause gene and chromosome mutations. **2** a radiomimetic (def. 1) substance or agent.

radionuclide a radioactive **nuclide**. —**radionuclidic** *adj.*

radionuclidic impurity any radionuclide, other than the nuclide that should be present, in a radioactive material.

radionuclidic purity or **radiopurity** (of a radioactive material) the proportion of the total **activity** (def. 2) that is in the form of the stated **radionuclide**.

radiotherapy *see* **radiology**.

radiotracer *an alternative name for* **radioactive tracer**.

radixin a protein of the erythrocyte band 4.1 family present in a variety of eukaryotic cells; it shares about 75% similarity with human **ezrin**. It is an actin barbed-end capping protein, highly concentrated in the undercoat of the cell-to-cell **adherens junction** and the cleavage furrow in the interphase and mitotic phase.

radyl (*in chemical nomenclature*) a term used to indicate any acyl, alkyl, or alkenyl group where this cannot be specified in detail.

RAF any gene encoding a Raf protein, of which there are at least three: Raf-1, A-Raf, and B-Raf. These are protooncogene cytoplasmic serine/threonine protein kinases (EC 2.7.1.–) of the Ras/Mos family; they are homologous with members of the protein kinase C family in both their conserved C-terminal catalytic and regulatory N-terminal domains. Human Raf-1 has binding domains for ATP, phorbol ester, and diacylglycerol. This protein is involved in transduction of mitogenic signals from the cell membrane to the nucleus. In the mouse, *raf* is the transforming gene of the mouse sarcoma

virus, 3611, v-Raf having a truncated regulatory domain that causes constitutive activation of kinase activity. The c-Raf-1 protein kinase, a 74 kDa protein, has been found in many mammalian cell types. Raf-1 is an important mediator of signals involving cell growth, transformation, and differentiation and is activated by a wide variety of extracellular stimuli. It has **MAP kinase** activity. In many cell types, Raf functions immediately downstream of the G-protein Ras (*see* **RAS**) in the activation pathway; Ras mediates translocation of Raf-1 to plasma membrane, where it is activated. In some cells Raf may be phosphorylated and activated by a protein kinase C. The physiological substrate for Raf kinase is a protein kinase (MEK) of yeast that is required for meiotic recombination and which on phosphorylation can activate MAP kinase.

raffinose or **gossypose** or **melitose** or **melitriose** the **trisaccharide** *O*- α -D-galactopyranosyl-(1 \rightarrow 6)-*O*- α -D-glucopyranosyl-(1 \rightarrow 2)- β -D-fructofuranoside; it occurs in plants almost as commonly as sucrose, being present, e.g., in cereal grains, cotton seeds, and many legumes. It is the first member of a series in which galactosyl residues are attached to sucrose, others being the tetrasaccharide **stachyose** and the pentasaccharide **verbascose**; these are all synthesized from sucrose by transfer reactions in which an α -D-galactopyranoside of *myo*-inositol (i.e. galactinol) is the donor of the galactosyl residues.

raft a sphingolipid- and cholesterol-rich microdomain in a plasma membrane. Rafts are similar in composition to caveolae, but lack caveolin, and are present in all cell types. They segregate and concentrate GPI-anchored, doubly acylated peripheral membrane proteins and transmembrane proteins. They may be precursors of caveolae.

RAG *abbr. for* recombination-activating gene; either of two genes (locus at 11p13) that encode the lymphocyte-specific RAG1 and RAG2 proteins. RAG1 is a zinc finger protein that forms heterodimers with RAG2. In cooperation, they bring together recombination signal sequences on the genes for V(D)J segments of the immunoglobulins. Rare inactivating mutations in either gene lead to T and B lymphocyte deficiency and severe combined immunodeficiency (SCID).

ragged-red fibers aerobic skeletal muscle fibers that accumulate enlarged and abnormal mitochondria containing highly-ordered inclusions when they are ischemic or anoxic. The mitochondrial aggregates appear red on staining with Gomori modified Trichrome. They are usually associated with mitochondrial disease. *See* **MERRF**.

Raji a lymphoblastoid cell line derived from an African patient with Burkitt's lymphoma.

r.a.m. *abbr. for* relative atomic mass.

ram *abbr. for* ribosomal ambiguity.

Ramachandran plot or **conformational map** a plot that shows the ranges of bond angles that are permissible and the main types of structure adopted by a polypeptide chain (e.g., α -helix, β -sheet). As the peptide bond, $-C'O-NH-$, is planar, a polypeptide chain has only two degrees of freedom per residue, the twist about the $C^\alpha-N$ bond axis, ϕ , and that about the $C^\alpha-C'$ axis, ψ . Some conformations will be easily achieved; others will be impossible, because they would bring neighbouring unbonded atoms or groups within van der Waals contact distances. The Ramachandran plot shows the permitted range within a plot of ϕ against ψ . [After G. N. Ramachandran (1922–).]

Raman scattering the inelastic scattering of a photon by a molecule, producing in the scattered light weak radiation of frequencies not present in the incident light. The sample does not have an absorption band at the wavelength of the incident light (*compare fluorescence*) and the frequency differences between the weak Raman lines in the spectrum and the exciting line are characteristic of the scattering substance and independent of the frequency of the exciting line. [After Chandrasekhara Venkata Raman (1888–1970), Indian physicist.]

Raman spectrum a plot of **Raman scattering** over a range of frequencies.

Ramos a lymphoblast cell line derived from a Caucasian patient with Burkitt's lymphoma.

RAMP *abbr. for* receptor activity modifying protein.

Ran a small nuclear G-protein involved with **karyopherins** that exists

in two conformational states depending on whether it binds GTP (RanGTP) or GDP (RanGDP). RanGTP causes disassembly of complexes of cargo plus **importin-β** but is required for assembly of cargo-**exportin** complexes. RanGTP concentrations are higher in the nucleus than the cytoplasm thus favouring disassembly of import complexes and formation of export complexes. *See also* **РАН**.

РАН a gene encoding a small nuclear G-protein, first identified as a well-conserved gene distantly related to *H-RAS*. Its product, Ran, interacts with **RCC1**, and the complex is involved in regulating cell-cycle progression and messenger RNA transport. In the absence of **RCC1**, GDP-Ran predominates and this results in activation of **M-phase-promoting factor** and chromatin condensation. The presence of **RCC1** activates nucleotide exchange on Ran, increasing the amount of GTP-Ran and preventing premature chromatin condensation. *See also* **nuclear pore, Ran**.

random coil the condition in solution of a linear polymer that exhibits little side group interaction, or resistance to rotation about the bonds in its chain. There are no preferred conformations. Quantitative expressions have been developed for the average radius of gyration. The term has formerly been incorrectly applied to various states of protein chains.

random copolymer a polymer of more than one species of monomer, in which the sequence of species within the polymer is not predetermined by controlled steps during synthesis, but depends only on random collisions between the reactant molecules. An example is the sequence of bases in RNA synthesized from nucleoside diphosphates by **polynucleotidophosphorylase**.

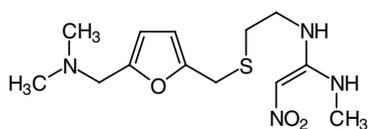

randomization or **randomisation** (*in experimental design*) the generation of data sets with different arrangements of the data, within the constraints of the experimental design. Randomization obviates the possibility of a systematic relationship between the data and any measurable characteristic of the procedure by which the data were sampled.

random mechanism or **random pathway** (for an enzymic reaction involving two substrates, $A + B \rightleftharpoons C$) a mechanism in which the enzyme, E, may first react with either substrate and the resulting enzyme-substrate complex then reacts with the second substrate, e.g. $A + E \rightleftharpoons EA$ then $EA + B \rightleftharpoons EAB$, or, $B + E \rightleftharpoons EB$ then $EB + A \rightleftharpoons EAB$, subsequently $EAB \rightleftharpoons E + C$. *Compare* **ordered mechanism**.

random priming a technique in which a mixture of short (typically 6 bp) oligonucleotides primes reactions catalysed by DNA polymerases. It is used in the synthesis of labelled DNA probes and is one of the options when priming cDNA synthesis catalysed by reverse transcriptase. Because all combinations of six nucleotides are present in the mixture of hexamers, priming is ensured at some point in the template sequence without prior need for specific sequence information.

random sample a selection of part of a population made in such a way that no individual is favoured over any other individual. *See also* **sample, statistical sample**.

ranitidine a competitive antagonist at histamine H₂ receptors, being the major and pharmacologically more selective analogue of the imidazole derivative, **cimetidine**. It inhibits histamine- and pentagastrin-evoked gastric acid secretion and cardiac stimulation and also inhibits gastric secretion evoked by physiological stimuli, agonists at muscarinic cholinergic receptors, and gastrin. It is used in the treatment of gastric and duodenal ulcers. *One proprietary name:* Zantac (hydrochloride).

RANK *abbr.* for receptor activator of NF-κB; a member of the tumour necrosis factor receptor family that is present on osteoclasts and is the receptor for **RANKL**, which is present on osteoblasts and their precursor cells. The interaction of RANK with RANKL causes osteoclasts to differentiate and become active unless osteo-

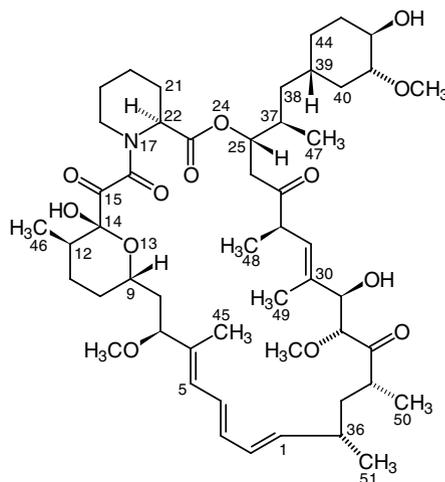

protegerin (which also binds RANKL) is present. Mutations in RANK cause familial expansile osteolysis.

RANKL *abbr.* for RANK ligand; *other names:* osteoprotegerin ligand; TNF-related activation-induced cytokine (*abbr.:* TRANCE). RANKL is released from its transmembrane precursor present on osteoblasts and their precursor cells, and the transmembrane precursor of RANKL, which is released by the action of an ADAM metalloprotease. It is the ligand for RANK on osteoclasts.

RANTES *abbr.* for regulated upon activation, normal T-cell expressed and secreted chemokine; *other names:* small inducible cytokine A5; a chemokine secreted by T cells and macrophages on stimulation by mitogens, that acts as a chemoattractant, and stimulates basophils and eosinophils.

ranunculeic acid *another name for columbinic acid*.

rapamycin an immunosuppressant (and antifungal agent) from *Streptomyces hygroscopicus*; it is used to reduce rejection of organ transplants. Unlike cyclosporin A it is antiangiogenic and thus anticancer. It is a lipid-soluble macrocyclic lactone, with the unusual feature of a cyclohexane ring. It competes with **FK506** for a common binding site on **FKBP**. Moreover, it inhibits the signalling pathway of interleukin 2 and certain other cytokines, and also **mTor**. *See also* **cyclosporin**.

RAPD PCR *abbr.* for random polymorphic DNA PCR; a variation of the **polymerase chain reaction** in which many short (≈10 nucleotide) primers are used. The products of the reaction from different sources can lead to recognition of polymorphisms and physical maps.

rape or **colza** a herbaceous plant, *Brassica napus*, of the mustard family, Cruciferae; it resembles a turnip, and the seeds yield valuable **rapeseed oil**.

rapeseed oil oil derived from the seed of **rape**; it is widely used as a lubricant and cooking fuel, and for the manufacture of animal foodstuffs, soap, and synthetic rubber. It contains **erucic acid**, which has cardiotoxic effects varying with species; rape varieties of low erucic acid content have recently been developed.

rapid-reaction kinetics the kinetic analysis of an enzyme reaction before the steady state is reached. The **stopped-flow method** is commonly used, in which two independent sources of substrate and enzyme are mixed immediately before flow through a spectrophotometer cell. An opposing syringe stops the flow immediately before activating the detection and recording system, such that reaction times of a few milliseconds can be achieved. Characteristically, reaction rates may be appreciably faster than during the steady state. In the **quenched flow** modification of the method, a further reagent is added to stop the reaction immediately before detection and recording. *See also* **relaxation kinetics**.

Rapport-Lübering shunt a unique feature of erythrocyte glycolysis in which the glycolytic intermediate 3-phosphoglyceroyl phos-

phate is converted by bisphosphoglycerate mutase to 2,3-bisphosphoglycerate, which is in turn converted to 3-phosphoglycerate and inorganic phosphate by bisphosphoglycerate phosphatase, both reactions being catalysed by a single enzyme molecule. The shunt bypasses the near equilibrium phosphoglycerate kinase reaction, one of the two ATP-generating reactions of glycolysis. Since 2,3-bisphosphoglycerate is an important intracellular modulator of hemoglobin function, regulation of the Rapoport–Lübering shunt balances the energy needs and oxygen-transporting function of the red cell. [After Samuel Mitija Rapoport (1912–2004) and J. Lübering.]

RAR *abbr. for* retinoic acid receptor.

rare cutter any of a class of restriction endonucleases that cleave infrequently within human DNA and then mostly at sites that contain a CpG dinucleotide within the recognition sequence.

rare earth (*strictly*) an oxide of a **rare earth metal**, or (*more loosely*), a rare earth metal itself.

rare earth metal or **rare earth element** scandium, yttrium, or a lanthanoid.

RAS an oncogene (*v-ras*) discovered in the retroviruses Harvey and Kirsten rat sarcoma viruses. There are three closely related (85% homology) oncogenes, *Ha-ras*, *Ki-ras*, and *N-ras*. Their cellular counterparts encode 21 kDa guanine nucleotide-binding proteins that regulate growth and differentiation in nearly every eukaryotic cell studied. There are two subfamilies, the Rho and Rac proteins (involved in relaying signals from the cell-surface receptors to the actin cytoskeleton) and the Rab family (involved in regulating the traffic of intracellular transport vesicles). Ras proteins undergo modification of the N and C termini that localize them to the plasma membrane. Ras is considered active in the GTP-bound form and inactive in the GDP-bound form. The intrinsic rate of nucleotide exchange and GTPase activity is very slow. Ras•GDP predominates in resting cells, but when Ras is activated by occupied receptors, specific guanine nucleotide exchange factors (GEFs), e.g. **Sos**, enhance nucleotide exchange leading to Ras•GTP, GTP exceeding GDP in cytoplasm. Ras•GTP then activates downstream effector proteins such as Raf-1 (*see raf*). Activated GTPase activating protein (GAP) causes the formation of inactive Ras•GDP. The retroviral oncogene, *v-ras*, encodes a protein that differs from the *c-ras* product in a single residue. If this affects amino acids 12, 13, 59, 61, or 63 the protein fails to hydrolyse its bound GTP and so persists abnormally in its active state, constitutively transmitting an intracellular signal for cell proliferation. Alternatively, some transforming mutations increase the rate at which Ras can exchange guanine nucleotides, e.g. when amino acids 116, 117, 119, or 146 are affected, again increasing the amount of Ras•GTP. Activated *ras* oncogenes occur in up to 30% of all human tumours, with the most common mutations being at codons for amino acids 12 and 13. In some types of malignancy, the figure is nearly 100%. Two genes corresponding to *H-ras* occur in yeast; they encode **G-proteins** that inhibit **adenylate cyclase**.

raisiRNA *abbr. for* repeat-associated siRNA. Transcription from opposing promoters found in repetitive DNA elements leads to the formation of long dsRNAs. These are cleaved by **Dicer** into siRNAs which are unwound and used in the RNA-induced transcriptional silencing complex (RITS) which directs silencing of chromatin in the region from which the dsRNA was transcribed. Silencing is thought to involve methylation of lysine 9 of histone H3.

RasMol *see* visualization software.

RAST *abbr. for* radioallergosorbent test.

rate coefficient *see* rate constant.

rate constant or **rate coefficient** *symbol:* k ; a constant relating the concentration of a reactive species to the velocity of a reaction; thus for a first order reaction (*see* **order of reaction**) such as: $EA \rightarrow E + A$, the rate of reaction, v , is proportional to the concentration of the reactant EA, so $v = k[EA]$, where k is the first-order rate constant. For a second order reaction, e.g. $E + A \rightarrow EA$, the rate is proportional to the product of the reactant concentrations, i.e. $v = k[E][A]$, where k is the **second-order rate constant**.

rate-determining step *see* rate-limiting step.

rate-limiting step the slowest step in a reaction sequence; i.e. the step with the smallest rate constant.

rate of consumption *see* rate of reaction.

rate of conversion *symbol:* $\dot{\xi}$; for a specified chemical reaction, the rate of increase of the extent of reaction at any moment in time, regardless of the conditions under which the reaction is carried out: $\dot{\xi} = d\xi/dt$, where ξ is the extent of reaction and t is time. In the case of a reaction with one-to-one stoichiometry, such as a typical simple enzyme-catalysed reaction, the extent of reaction is equal to the amount of a reactant consumed or the amount of a product formed. Rate of conversion is an extensive quantity (*see* **extensive property**), its dimensions are (amount of substance) divided by time, and it is expressed in mol s^{-1} (*compare* **rate of reaction**). It is therefore independent of the volume of the system. Where this volume remains constant, as during a typical enzyme-catalysed reaction, the rate of conversion is equal to the rate of reaction multiplied by the volume: $\dot{\xi} = vV$. The term was formerly known in physical chemistry as rate of reaction. *See also* **catalytic activity**.

rate of formation *see* rate of reaction.

rate of reaction or **velocity of reaction** or (*sometimes*) **reaction rate**

1 *symbol:* v ; for a specified enzyme-catalysed reaction of a typical kind (i.e. one involving a single substrate, S, a single product, P, one-to-one stoichiometry between them, and constant-volume conditions), the **rate of consumption** of substrate or the **rate of formation** of product at any moment in time is given by:

$$v = -d[S]/dt = d[P]/dt,$$

where [S] and [P] are respectively the concentrations of substrate and product, and t is time. A similar set of relationships applies where there are several reactants in one-to-one stoichiometry, but if the overall stoichiometry is not one-to-one – a situation rarely arising in enzyme kinetics – the relationships are more complicated. Where intermediates are formed in amounts comparable to those of the reactants, there is time-dependent stoichiometry and a rate of reaction for the complete reaction cannot be specified. Rate of reaction is an intensive quantity (*see* **intensive property**), its dimensions are (amount-of-substance concentration) divided by time, and it is expressed in $\text{mol L}^{-1} \text{s}^{-1}$ (*compare* **rate of conversion**). *See also* **initial velocity**, **limiting rate**. **2** (*formerly, in physical chemistry*) the extensive quantity now termed **rate of conversion**.

rate theory of agonist action a theory of agonist action stating that the response to an agonist is proportional to the number of receptor–agonist associations per unit time, i.e. to the rate of receptor occupation, the binding of agonist to receptor being reversible. The response is therefore maximal at time zero and falls exponentially to an equilibrium value.

rational drug design the design of drug molecules based on the 3D structure of the target molecule. Owing to its complexity, the approach has had only limited success, but it has worked for some targets where the molecular mechanism of activation or inactivation is well understood (e.g. some enzymes), or where structural modifications are readily engineered (e.g. antibodies).

raw sequence (*in bioinformatics*) in the early stages of the sequencing process, sequence reads that are unassembled and carry no annotation.

Rayleigh ratio *symbol:* R ; the ratio of the intensity of light scattered by particles (molecules) in solution at an angle θ from the incident beam, I_θ , multiplied by the square of the distance, r , from the particle to the detector, divided by the intensity of the incident light, I_0 , i.e. $R = I_\theta r^2/I_0$. The **reduced Rayleigh ratio**, $R_\theta = I_\theta r^2/I_0(1 + \cos^2\theta)$. Many literature references do not distinguish between these two. *See also* **Rayleigh scattering**. [After John William Strutt, Lord Rayleigh (1842–1919), British mathematician and physicist.]

Rayleigh scattering the elastic scattering of photons of light by molecules or atoms of the substance through which the light is passing. When light passes through a liquid or gas, atoms or molecules are polarized by the electric vector of the light, thus inducing a rapidly fluctuating dipole in the atoms or molecules in the light path. The fluctuating dipole leads to the emission of electromagnetic waves in various directions of the same frequency as the incident radiation, and this emission is seen as scattered light. *See also* **Rayleigh ratio**.

Rb *symbol for* rubidium.

RB a human tumour suppressor gene that encodes a nuclear phospho-

protein, **retinoblastoma protein**. Inactivation or loss of *RB* on both copies of the chromosome (13q14) leads to **retinoblastoma**.

R band *see* **Giemsa's stain**.

RbAp *abbr. for* retinoblastoma-associated protein. *See* **Sin 3-HDAC**.

rBAT *abbr. for* related to basic amino acid transporter. *See* **cystinuria**.

RBC or **rbc** or **r.b.c.** *abbr. for* red blood cell. *See* **erythrocyte**.

Rbe *abbr. for* relative biological effectiveness (i.e. **quality factor**).

R-binder *an alternative name for* **haptocorrin**.

RBS *abbr. for* René Borghgraef solution; *the proprietary name for* any of a range of general-purpose surfactants and decontaminating agents, especially for laboratory use, that have combined detergent and chelating properties. They are identified with a number or other designation, e.g. RBS 25, RBS 35, RBS solid.

RCC1 a chromatin-bound guanine nucleotide release (or exchange) factor. Its function is required for the normal coupling of the completion of DNA synthesis and the initiation of mitosis. It is also necessary for RNA export from the nucleus, spindle formation, and formation of the nuclear envelope during cell division. It binds to and acts on the nuclear G-protein, **Ran**. [From regulator of chromosome condensation.]

RCF *abbr. for* relative centrifugal force.

R chromophore a **chromophore** that gives rise to low-intensity absorption bands at long wavelengths. *Compare* **K chromophore**. [From German *Radikal*.]

RCP *abbr. for* radiochemical purity.

RCS *abbr. for* rabbit aorta-contracting substance.

RCSB *abbr. for* Research Collaboratory for Structural Bioinformatics; *see* **structure database**.

rd *symbol for* rad (def. 2) (alternative to rad).

Rd *abbr. for* rubredoxin.

RDBMS *abbr. for* relational database management system.

rDNA 1 *abbr. for* ribosomal DNA. **2** (*sometimes*) *abbr. for* recombinant DNA; use not recommended because of possible confusion with ribosomal DNA.

re- *prefix (in chemical nomenclature)* denoting *rectus* (i.e. right, or clockwise) configuration of a face of a trigonal atom. *See* **re/si convention**.

Re *symbol for* rhenium.

Re *symbol for* Reynolds number.

RE *abbr. for* (eukaryotic) response element.

reactivity of enzymes the number of reactants involved in an enzyme-catalysed reaction in a given direction. The numbers of kinetically important substrates or products in an enzyme mechanism are designated by Uni (1), Bi (2), Ter (3), or Quad (4). Thus, e.g., UniUni indicates one substrate and one product, and Ter Bi indicates three substrates and two products.

reactant any material participating in a chemical reaction in a given direction.

reaction (*in chemistry*) any process in which molecules interact with one another, leading to chemical or physical change.

reaction centre *see* **photosystem**. *Compare* **photosynthetic reaction centre**.

reaction intermediate a transient chemical species, with a lifetime appreciably longer than a molecular vibration time, formed directly or indirectly from the reactants of a chemical (often enzymic) reaction, and that further reacts (directly or indirectly) to give the reaction products.

reaction rate (*sometimes*) *an alternative term for* **rate of reaction**.

reaction time *an alternative name for* **latent period** (def. 1).

reactivate to restore activity to any enzymic or cellular system.

reactive describing any molecular entity or centre that is capable of reacting readily. Thus, a **reactive centre** is the point in the molecule at which electron configurations favour a reaction.

reactive oxygen species *abbr.:* ROS; a highly active oxygen species, such as **superoxide** ion, hydroxyl radical, hydrogen peroxide (H₂O₂), or peroxyxynitrite. Most ROS are generated as toxic by-products of oxidative phosphorylation in mitochondria. H₂O₂ is also produced by various reactions in peroxisomes, and by phagocyte NADPH oxidase, thyroperoxidase, and xanthine oxidase in specific cell types. Cells protect themselves through the superoxide dismutase, glutathione peroxidase, and catalase activities, and the antioxidants (e.g. glutathione, carotene) they contain. Chronic exposure

to ROS causes oxidative damage to mitochondrial and cellular proteins, lipids, and nucleic acids. *See* **oxidative stress**.

reactivity the degree to which a molecule or centre is reactive.

reading (*in molecular biology*) the process of one-way linear decoding of a nucleotide sequence during, e.g., **transcription** or **translation**.

reading frame any sequence of bases in DNA that codes for the synthesis of either a protein or a component polypeptide. The point of initiation of reading determines the frame, i.e. the way in which the bases will be grouped in triplets as required by the genetic code. For example, the sequence

–ATGGTCA–

could be grouped

–A,TGG,TCA–

or

–AT,GGT,CA–

or

–ATG,GTC,A–

depending on the point at which the reading frame begins. In double-stranded DNA there six potential reading frames. *See also* **open reading frame**.

readthrough the continuation of DNA transcription beyond a normal termination sequence, due to a failure of RNA polymerase to recognize the termination signal. Readthrough may also occur in translation, where a mutation has caused a termination codon to be converted to a codon for an amino acid (a sense codon); this is the underlying etiology of several **hemoglobinopathies**. *See also* **readthrough protein**.

readthrough protein a product formed by translation of a messenger RNA when one of its termination codons is misread, or is recognized by a **suppressor tRNA**. Polypeptide-chain synthesis then continues until the next termination codon is reached, resulting in the production of a variant protein with a C-terminal extension.

reagent 1 any chemical substance that reacts or participates in or is necessary for a reaction. **2** a substance used for the detection or determination of another substance by chemical or microscopical means, usually in solution; e.g. the **Folin-Ciocalteu reagent**.

reagent grade a level of purity of a chemical; chemicals of this quality conform to the specifications established by the Committee on Analytical Reagents of the American Chemical Society and may often be sufficiently pure to use as primary standards in an analytical laboratory, with information concerning the actual percentage of impurities or at least the maximum limit of impurities being given on the label.

reagin 1 a heat-labile antibody-like substance in the serum of many people suffering from atopic allergies, and identical with immunoglobulin E (IgE). The **immediate hypersensitivity** (type I) generated by the binding of IgE to its specific antigen on the surface of mast cells involves the release of cell mediators via the reaginic or anaphylactic mechanism. **2** a special kind of antibody response produced by syphilitics that has specificity for **cardiolipin** antigens.

real-time (*in computing*) indicating that a computer monitors a process continuously as it occurs, in distinction to the analysis of recorded data.

real-time PCR a variant of the **polymerase chain reaction** (PCR) in which the quantity of amplified DNA is recorded in each cycle by monitoring the fluorescence intensity of a DNA-binding dye such as **SYBR Green**. An advantage is that the kinetics of the reaction can be monitored and, with reference to the behaviour of standards, the amount of PCR product quantified. The abbreviation RT-PCR for real-time PCR is to be deprecated. Real-time PCR is frequently used for quantitation of reverse transcriptase PCR in which case real-time RT-PCR is the appropriate terminology. *See* **RT-PCR**.

rearrangase or **S–S rearrangase** *an alternative name for* **protein disulfide isomerase**.

rearrangement reaction a reaction in which molecular bonds are rearranged without the loss of any atom from the molecule, e.g. as in the conversion of glucose 6-phosphate to fructose 6-phosphate.

recA a gene in *Escherichia coli* encoding a protein, RecA, involved in **genetic recombination** and in the SOS response for DNA repair (*see*

SOS repair). The protein has two activities: (1) a DNA-dependent ATPase in the presence of single-stranded DNA that catalyses the ATP-dependent uptake of single-stranded DNA to form the heteroduplex required in recombination. (2) In the presence of DNA fragments it becomes a protease (RecA*; EC 3.4.99.37) that cleaves a specific Ala-Gly bond in certain repressor molecules, including its own repressor (see *lexA*). This allows all the SOS genes to be activated. See also **exodeoxyribonuclease V**, **recombinational repair**, **recombinase**.

recalcitrance or persistence the ability of a substance to remain in a particular environment in an unchanged form.

recall or sensitivity (*in informatics*) the proportion of the true members of a set that are correctly identified by a prediction algorithm: true positives/(true positives + false negatives).

recBC a gene in *Escherichia coli* for **exodeoxyribonuclease V**, an ATP-dependent nuclease specific for double-stranded DNA; it mediates **genetic recombination**.

recDNA (*sometimes*) *abbr.* for recombinant DNA.

receiver operating characteristic or receiver operator characteristic *abbr.*: ROC; (*in signal detection theory*) a graphical representation of the relationship between true and false hits for a binary classifier system as its discrimination threshold is varied. ROC curves are used, for example, in bioinformatics to evaluate prediction algorithms: results in the top left of the plot denote 100% sensitivity (all true positives found) and 100% specificity (no false positives found); completely random results lie on a straight line at 45° from the origin, indicating that, as the threshold is raised, equal numbers of true and false positives are matched.

receptor any cellular macromolecule that binds a hormone, neurotransmitter, drug, other agonist, or intracellular messenger to initiate a change in cell function. Receptors are concerned directly and specifically in chemical signalling between and within cells. Cell-surface receptors, e.g. the **acetylcholine receptor** and the **insulin receptor**, are located in the plasma membrane, with their ligand-binding site exposed to the external medium. Receptors may also be present in membranes of the sarcoplasmic reticulum (e.g. ryanodine receptor), T tubule (e.g. dihydropyridine receptor), or endoplasmic reticulum (e.g. inositol trisphosphate, or IP₃ receptor). Intracellular receptors (e.g. steroid-hormone receptors) bind ligands that enter the cell across the plasma membrane. These can be located in the cytosol or nucleus. Receptors can be catalytic, enzyme-associated, or G-protein-associated.

receptor activator of NF-κB *see* **RANK**.

receptor activity modifying protein *abbr.*: RAMP; a single-transmembrane-domain protein required for expression of calcitonin gene-related peptide or adrenomedullin receptor phenotypes from the calcitonin receptor-like receptor gene (CRLR). For full activity, CRLR forms heteromers with RAMP and receptor component protein.

receptor assay 1 the determination of receptor numbers and the dissociation constant of receptor-ligand binding. The binding at various concentrations of ligand is measured, often by use of a radioactive ligand, and is analysed by means of a **Scatchard plot**. **2** the determination of the concentration of a ligand by utilizing a purified receptor in a manner similar to that used in **radioimmunoassay**; in this case the receptor, rather than an antibody, performs the role of specific binding agent.

receptor cross-talk interaction between two receptors such that one receptor, when activated, modulates the action of the other. This type of interaction often involves the production by the first receptor of a **second messenger**, which then modulates the action of the second receptor.

receptor-destroying enzyme an enzyme that brings about chemical change in a (usually membrane-bound) receptor, leading to inactivation of the receptor. Knowledge of the specificity of the enzyme provides information about the nature of the groups or linkages exposed to enzyme attack, and thus to receptor structure or orientation in the membrane. Examples are **sialidase** and **trypsin**.

receptor-effector complex the complex that results when an occupied receptor binds to another protein (the **effector**), the activation of which by the occupied receptor leads to signal transduction.

receptor-mediated describing a response that requires the intermediary action of a receptor, especially one located in a membrane.

receptor-mediated endocytosis a form of **endocytosis** involving the internalization (i.e. passage into the cell interior) of stretches of membrane into which receptors have clustered after binding of ligand. The cytoplasmic surfaces of these stretches of membrane are coated with **clathrin** and are termed **coated pits**. *See also* **endosome**.

receptor transformation *see* **transformation** (def. 3).

recessive describing an **allele** that lacks effect when accompanied in the same diploid by a **dominant** form of the same gene. Most (not all) defective mutant genes are recessive to their normal functional counterparts. —**recessivity** *n*.

RecET a **recombinase** from the Rac prophage of *E. coli* consisting of *recE*-encoded exonuclease VIII and the RecT protein. Together they catalyse recombination between linear duplex DNA and homologous circular single-stranded DNA. RecET is used for **recombinering**.

RecG an *E. coli* helicase involved in DNA recombination, acting with RuvC to resolve **Holliday junctions**.

recipient bacterium *see* **bacterial conjugation**.

reciprocal 1 expressed in the reverse direction, in response to an initial application of any force or stimulus. **2** (*in mathematics*) the inverse value, obtained when the values of numerator and denominator are reversed; the reciprocal of *x* is obtained by evaluating 1/*x*.

reciprocal plot a plot in which the units of both the ordinate and the abscissa are reciprocals of the values that have been determined. *Compare* **Lineweaver-Burk plot**.

reciprocal translocation a chromosomal rearrangement in which the ends of, usually, two nonhomologous chromosomes are exchanged. If the reciprocal translocation is balanced there is no loss or gain of genetic material after the exchange.

recircularization or recircularisation the restoration of circularity to a plasmid vector following the insertion of recombinant DNA. The plasmid used for gene cloning is a small circular molecule. This is cut with a **restriction endonuclease** to create linear DNA molecules. The foreign DNA fragment with the same cohesive ends is then annealed to the cut plasmid to form a recombinant DNA circle. The DNA molecule containing the foreign DNA insert is then covalently sealed with **DNA ligase**. Recircularization also occurs during the replication of some DNA phages by a **rolling circle** replication mechanism.

recognition any specific binding interaction between molecules. Such interaction between two molecules is based on the existence of **recognition sites**, one (or more) on each of the interacting molecules, that are tailored to fit in such a way that highly specific binding occurs; i.e. the two molecules uniquely 'recognize' each other. *See also* **chiral recognition**, **molecular recognition**.

recognition sequence the part of the sequence of a macromolecule that is able to recognize and bind to a particular sequence in another macromolecule.

recognition site 1 (*in proteins*) a site for **recognition** of another protein, involving a specific sequence of amino acids; the latter may be in a single chain (e.g., a target site for protein phosphorylation), or may involve amino acids in separate chains brought into juxtaposition by quaternary structure. **2** (*in nucleic acids*) a site for recognition of a protein, involving a specific sequence of bases; *see* **restriction endonuclease**. **3** (*in pharmacology*) a region of a receptor macromolecule to which an endogenous agonist binds.

recombinant clone a population of bacteria or other host derived from a single cell into which a vector containing **recombinant DNA** has been introduced.

recombinant DNA a fragment of deoxyribonucleic acid (DNA) that has been inserted into a cloning vector, thereby leading to its use in the isolation of a clone of cells characterized by the presence of the fragment. The term is derived from the concept that insertion into the vector is a form of **genetic recombination**. [Note: The abbreviation rDNA has sometimes been applied to recombinant DNA, but this use is discouraged (rDNA having been pre-empted for ribosomal DNA); while alternatives such as recDNA or rtDNA have been suggested, IUBMB considers a standard abbreviation unnecessary.] *See also* **recombinant DNA technology**.

recombinant DNA technology an area of biotechnology con-

cerned with the manipulation of **recombinant DNA**. It has many important applications, including (1) DNA sequencing, which may lead to the ability to predict the primary structure of a protein where this is the product of a cloned gene, (2) the synthesis of recombinant protein by a suitable expression system, and (3) the production of DNA **probes** (def. 3) for use in hybridization techniques. The technology has led, e.g., to the production of human insulin for the treatment of diabetics, human growth hormone for administration to children with growth defects, and a vaccine for hepatitis B. DNA probes are essential for the detection of aberrant genes which are the cause of numerous diseases and the technique has the potential for gene therapy. *See also* **genetic engineering**.

recombinant protein a protein encoded by a gene – **recombinant DNA** – that has been cloned in a system that supports expression of the gene and translation of messenger RNA (*see* **expression system**). Modification of the gene by recombinant DNA technology can lead to expression of a mutant protein. Proteins coexpressed in bacteria will not possess post-translational modifications, e.g. phosphorylation or glycosylation; eukaryotic expression systems are needed for this (*see*, e.g., **baculovirus**).

recombinase 1 an enzyme that recognizes specific sites involved in the joining of V-region gene segments in L- and H-chain gene segment pools in the generation of antibody. **2** RecA protein (*see* **recA**) is also a recombinase, the activity of which is increased in *Escherichia coli* following damage to DNA. RecA binds to a region of single-stranded DNA and catalyses the formation of duplex DNA; hydrolysis of ATP is involved. A recombinase recognizes and binds to each of two recombinant sites on different DNA molecules or within the same DNA. One DNA strand in each site is cleaved at a specific point within the site, and the recombinase becomes covalently linked to the DNA at the cleavage site through a phosphotyrosine (sometimes a phosphoserine) bond. The transient protein–DNA linkage preserves the phosphodiester bond lost in cleaving the DNA; cofactors such as ATP are unnecessary in subsequent steps. The cleaved DNA strands are rejoined to new partners, with new phosphodiester bonds created at the expense of the protein–DNA linkage. The result of the initial breakage and rejoining process is the **Holliday junction**. To complete the reaction, the process must be repeated at a second point within each of the two recombination sites. In summary the recombinase can be viewed as a site-specific endonuclease and ligase in one package.

recombination *see* **genetic recombination**, **recombinant DNA**, **immunoglobulin synthesis**.

recombination activating gene *see* **RAG**.

recombinational heteroduplex *see* **heteroduplex**.

recombinational repair a mechanism to restore the integrity of DNA when replication of DNA stops at a **thymine dimer** but resumes after the dimer is passed, creating a gap. The undamaged parental strand recombines into the gap, a process promoted by RecA protein (*see* **recA**). The new gap in the parental strand is filled by the action of **DNA polymerase** and **DNA ligase**. The thymine dimer itself is not repaired in this process but time is allowed for the excision system to repair this damage later.

recombineering or **recombination-mediated genetic engineering** a method for manipulating large DNA molecules such as **BACs** by promoting homologous recombination with linear DNA (such as products of the polymerase chain reaction). *E. coli* strains carrying recombinases such as **RecET** or bacteriophage lambda Red functions are used (*see* **Red recombination system**).

recoverin an **EF-hand** Ca²⁺-binding protein, apparent molecular mass 26 kDa; *also known as* **cancer-associated retinopathy protein**. It selectively localizes to the retina and pineal gland, and is implicated in the activation of retinal rod guanylate cyclase by rhodopsin, possibly being involved in the blocking of the phosphorylation of rhodopsin, by forming an inhibitory complex with rhodopsin kinase. It has been identified as an autoantigen in cancer-associated retinopathy, a putative autoimmune process.

recovery the portion of material or activity that remains after any extraction or purification, usually expressed as a percentage of the amount that was present as starting material.

RecQ-like protein 2 *an alternative name for* **BLM protein**.

recruitment the action by any cell, cell constituent, or molecule that

brings about the cooperation of any other component in performance of any function.

recrystallize or **recrystallise** to dissolve a crystalline substance and subsequently crystallize it from the solution, usually to increase the purity of the substance. —**recrystallization** or **recrystallisation** *n*.

rectangular hyperbola a **hyperbola** whose asymptotes are at right angles. It is sometimes said that, for enzymes that follow so-called **Michaelis kinetics**, the plot of initial rate against substrate concentration has the shape of the curve of a rectangular hyperbola. It is true that the Michaelis–Menten equation does yield a curve that is part of a rectangular hyperbola, but the axes of the hyperbola must be rotated through 45°, and displaced, if they are to coincide with the axes of the Michaelis–Menten plot.

rectification 1 (*in physics*) the process of obtaining a direct current from an alternating electrical supply. **2** (*in physiology*) the regulation of membrane conductance by the voltage across the membrane; strong rectification implies that ionic channels carrying current are open at some membrane potentials and shut at others. Conductance is low at very negative membrane potentials, but increases as the potential becomes less negative. **3** (*in chemistry*) the process of purifying a liquid by distillation.

rectus *Latin* right; used to describe the right, or clockwise, configuration of one of the two faces of a compound containing a trigonal carbon atom. It is designated by the prefix *re-*. *Compare* **sinister**. *See also* **re/si convention**.

recycle to pass again through a system one or more times after return to a starting condition or state.

RED *abbr. for* RNA-dependent deaminase. *See* **RNA editing enzyme**.

red drop a phenomenon in photosynthesis, in which the **quantum yield** is relatively constant in light of wavelengths between 500 and 600 nm, but drops dramatically at longer wavelengths.

redistil or (*US*) **redistill** to distil again that which has already been distilled, usually as an aid to purification of liquids.

red marrow *see* **bone marrow**.

red muscle dark, skeletal, voluntary muscle that is relatively rich in myoglobin and cytochromes, and derives energy for contraction from a high oxidative capacity, in contrast to **white muscle**, which has a high glycolytic capacity. The distinction between muscle types should more strictly be based on muscle-fibre types. Type I fibres have a high oxidative capacity based on a high activity of tricarboxylic-acid cycle and respiratory chain enzymes. Type IIA fibres have high oxidative and high glycolytic capacity. Type IIB fibres have low oxidative and high glycolytic capacity. The proportions of these fibres vary in different muscle types, and can be changed by training in athletes.

redox *abbr. for* reduction–oxidation; *see* **oxidation–reduction**.

redox balance the ratio of the number of reductions to the number of oxidations in a given metabolic pathway. *Compare* **redox state**.

redox couple the oxidized (electron acceptor) and the reduced (electron donor) forms of the species of a given **redox reaction**; e.g. NAD⁺ and (NADH + H⁺). The potential of any redox couple in solution can be measured against a reference electrode, and a table of relative potentials constructed. *See* **redox potential**.

redox hypothesis a now discounted model for the **Pasteur effect** in glycolysing muscle extracts. Addition of redox indicators that changed the redox state in the direction of oxidation decreased the rate of lactate formation; it was therefore suggested that the effect of oxygen might be connected with a change of the redox state in the same direction.

redox indicator *see* **indicator** (def. 3).

redox potential or **oxidation–reduction potential** *symbol:* E_0 ; for a particular **redox couple** at a given pH and temperature, the potential of an electrode (usually bright platinum) immersed in a solution containing 1 M oxidant and 1 M reductant, relative to a standard **hydrogen electrode**. The more ‘reducing’ the couple, the more negative is E_0 ; the convention in biochemistry is that the more ‘oxidizing’, the more positive is E_0 . Some standard potentials, measured against the hydrogen electrode at pH 7, are: NAD⁺/NADH + H⁺, –0.32 V; fumarate/succinate, +0.032 V; cytochrome *c*(Fe³⁺)/cytochrome *c*(Fe²⁺), +0.25 V; O₂ + 2H⁺/H₂, +0.82 V.

redox reaction a chemical reaction in which the oxidation of one reactant is coupled to the reduction of a second reactant, electrons

being transferred from the reactant being oxidized to that being reduced.

redox state the ratio of the concentration of the oxidized member of a **redox couple** to the concentration of the reduced member; e.g. $[\text{NAD}^+]/[\text{NADH}]$ or $[\text{Fe}^{3+}]/[\text{Fe}^{2+}]$. The term should only be applied to a particular redox system and not to a heterogeneous system.

Red recombination system a bacteriophage lambda-encoded recombination system. Full recombination potential requires the products of three genes: *exo*, *bet*, and *gam*. See **recombineering**.

red shift any shift of the peaks of a spectrum to longer wavelengths (i.e. towards the red end of the spectrum), including a shift from the red to infrared. Compare **blue shift**.

red tide a bloom of the dinoflagellate *Ptychodiscus brevis* (*Gymnodinium breve*), an organism that produces **brevetoxins** and causes epidemics of food poisoning.

reduce to cause or undergo **reduction**.

reduced folate carrier *abbr.*: RFC; any of several homologous membrane-associated glycoproteins that bind reduced folates and methotrexate with low affinity. The gene at 21q22.2 has multiple promoters and produces several isoforms, including the putative intestinal folate transporter.

reduced Rayleigh ratio see **Rayleigh ratio**.

reducing agent any substance acting as a **reductant**. Compare **oxidizing agent**.

reducing end the end of an oligo- or polysaccharide molecule that carries a potential hemiacetal or hemiketal (reducing) group.

reducing sugar any **sugar** that will reduce heated alkaline solutions of cupric salts, such as **Fehling's** or **Benedict's solutions**, due to the presence of a hemiacetal or hemiketal group.

reductant the chemical species that donates an electron in an **oxidation-reduction reaction**; i.e. the species that undergoes **oxidation** in such a reaction. Compare **oxidant**.

reductase a donor:acceptor oxidoreductase enzyme (EC class 1) when named after the more oxidized alternative substrate and when O_2 is not a substrate. See **oxidoreductase**.

reduction the chemical process by which oxygen is withdrawn from, hydrogen is added to, or (more generally) an electron is added to (with or without addition of a proton) a molecular entity. Compare **oxidation**. —**reductive** *adj.*; **reduce** *vb*.

reduction division the first division of **meiosis**.

reduction potential the electrode potential that measures the tendency of one half of a **redox reaction** to proceed so as to gain electrons. See **oxidation potential**, **redox potential**.

reductive alkylation the reaction of amino groups with an alkyl carbonyl group, followed by reduction of the resulting **Schiff base** with a reducing agent such as sodium borohydride. See **reductive amination**.

reductive amination the process whereby ammonia or a primary or secondary amine reacts with ketones and aldehydes in the presence of reducing agents such as H_2 and a metal catalyst, or more conveniently, NaBH_4 or its derivative NaBH_3CN , to produce primary, secondary, or tertiary amines. In a formal sense, the amine is alkylated in this reaction while the carbonyl group is reduced, hence the term **reductive amination**, or alternatively **reductive alkylation**. Amino acids have been made from oxo acids by this process. A variation of reductive amination, termed the **Eschweiler-Clarke reaction**, involves the methylation of an amine to the tertiary amine stage using formic acid as the reducing agent and formaldehyde as the methylating reagent.

reductive carboxylic-acid cycle or **reductive tricarboxylic-acid cycle** a metabolic cycle used by members of the Chlorobiaceae for CO_2 fixation. The usual operation of the tricarboxylic-acid cycle is reversed, with three enzyme replacements, and other supplementary reactions are used. Initially one CO_2 reacts with succinyl-CoA to form oxoglutarate; oxoglutarate synthase (EC 1.2.7.3) replaces the usual **oxoglutarate dehydrogenase complex**. A second CO_2 converts oxoglutarate to isocitrate with use of **isocitrate dehydrogenase**, and isocitrate proceeds to citrate. Citrate is then cleaved by ATP citrate (*pro-S*) lyase to acetyl-CoA and oxaloacetate; the latter recycles to succinyl-CoA with fumarate reductase (NADH) replacing succinate dehydrogenase. These operations convert two CO_2 to acetyl-CoA. A net gain of oxaloacetate is possible by conversion of acetyl

CoA and one CO_2 to pyruvate (pyruvate synthase), pyruvate to phosphoenolpyruvate (phosphoenolpyruvate synthase) and **phosphoenolpyruvate** and one CO_2 to oxaloacetate (**phosphoenolpyruvate carboxylase**). The overall result is that four CO_2 yield a net gain of the four-carbon oxaloacetate.

reductive methylation a specific form of **reductive alkylation**, in which the alkyl group is methyl. Formaldehyde is often used as a reagent in this case.

reductive pentose-phosphate cycle or **Calvin cycle** *other names*: carbon reduction cycle; C_3 cycle/pathway; more appropriately, Calvin-Bassham cycle; the cyclic set of reactions, occurring in chloroplasts in the majority of higher plants (**C_3 plants**), that results in the fixation of CO_2 as glucose using the ATP and the NADPH formed in the light reactions of photosynthesis. Briefly, CO_2 reacts with ribulose 1,5-bisphosphate under the action of **ribulose-bisphosphate carboxylase** (Rubisco), EC 4.1.1.39, to form two molecules of 3-phosphoglycerate; these are phosphorylated (by ATP) to 1,3-bisphosphoglycerate, which in turn is reduced (by NADPH) to glyceraldehyde 3-phosphate. This is then converted by aldolase, transketolase, and other enzymes to fructose 6-phosphate and ribulose 5-phosphate; the latter being phosphorylated (ATP) to ribulose 1,5-bisphosphate, completing the cycle. See also **Hatch-Slack pathway**.

reductone any reducing substance with a chemical structure containing the stabilized enediol $-\text{C}(\text{OH})=\text{C}(\text{OH})-$. Reductones are generated when monosaccharides are heated for prolonged periods with strong alkali, whereby the enols originally produced are broken down to strongly reducing fragments. Another notable example is ascorbic acid, and in some contexts reductones are described as 'apparent ascorbate', i.e. the reductive acids that are present in certain processed foods and react similarly to ascorbate, interfering with its determination.

reelin a large extracellular matrix protein encoded by the gene that, when defective in mouse, produces the neurological mutant called reeler. It is a serine protease that degrades fibronectin, laminin, and collagen, and is secreted by the earliest neurons during development. It binds receptors (e.g. for ApoE and for very low-density lipoproteins) on adjacent neurons to govern the overall patterning of cortical neurons into layers and to control neuronal migration.

re-entrant loop a segment of a membrane protein that loops between two neighbouring transmembrane helices and is partly outside and partly inside the membrane. It may be extracellular or intracellular.

Re-face (of an atom or molecule) see **Re/Si convention**.

reference something that acts as a standard in relation to quality, quantity, or type against which other values or characteristics can be compared; e.g. reference spectrum.

reference electrode any electrode, selected by convention, against which the electronegativity of compounds is measured. The standard biochemical reference is the **hydrogen electrode**, normally a platinum electrode in hydrochloric acid through which hydrogen gas is passed. A cell is constructed such that another electrode is immersed in a test solution and the potential difference between these two half-cells is measured. For convenience, however, the reference electrode is often a **calomel electrode**, and after measurements have been made against this, the electronegativity against the hydrogen electrode can be calculated from the known difference between this and the hydrogen electrode.

reflect to change the path of electromagnetic radiation, when it meets a surface, such that it returns partially or completely in a direction on the same side of the surface as the source.

reflectometer see **densitometer** (def. 1).

reflex (*in physiology*) an automatic or involuntary response of the nervous system to a stimulus. A reflex may be a monosynaptic spinal reflex (e.g. a simple motor response to a sensory stimulus), involving transmission through the spinal cord only, or polysynaptic and involving synaptic transmission in the brain. A **conditioned reflex** is one that is learned through repeated association of a stimulus with either rewarding (e.g. food) or aversive (e.g. punishment) events.

refolding (*for proteins*) the restoration of 3-D structure in a manner that may or may not achieve a full return to the native state following **denaturation**.

refraction the change in direction undergone by a wave of electromagnetic radiation on passing through a boundary between two media in which its velocity differs. **Snell's law** states that $n_1 \sin \theta_1 = n_2 \sin \theta_2$, where n_1 and n_2 are the **refractive indices** of the two media, and θ_1 and θ_2 are the angles between the radiation and the normal to the boundary in the corresponding media. [After Willebrord Snell (1591–1696), Dutch astronomer and mathematician.]

refractive index *abbr.*: RI; *symbol*: n ; for a given medium, a measure of the degree of **refraction** induced by the medium when light or other electromagnetic radiation passes through it. The refractive index of a medium is the ratio of the speed of light in a vacuum, c_0 , to the speed of light in the medium, c ; i.e. $n = c_0/c$. For many practical purposes the speed of light in air may be used instead of that in a vacuum.

refractivity a measure of the extent to which a medium will cause the deviation of a ray of light or other electromagnetic radiation entering its surface. If the **refractive index** of a medium is n , its refractivity is $(n - 1)$. The **specific refractivity** is given by $(n - 1)/\rho$, where ρ is the density of the medium. The **molecular refractivity** is the specific refractivity multiplied by the relative molecular mass.

refractometer an instrument for measuring **refractive index**.

refractory 1 (of a clinical condition) resistant to treatment. **2** (of a cell or tissue) resistant to stimulation, as by a drug, hormone, or nerve impulse, especially during a period following previous stimulation. *See also tachyphylaxis.* **3** (of a substance or material) resistant to heat, corrosion, mechanical deformation, or other aggressive agents causing alteration. **4** a substance or material having such resistance.

Refsum's disease (classical) or Refsum's disease (adult) other name: phytanic acid storage disease; a rare autosomal recessive inherited disease starting in adulthood with neurological symptoms, including retinitis pigmentosa, peripheral neuropathy, cerebellar ataxia, and nerve deafness. It is caused by several mutations that lead to deficiency of peroxisomal phytanoyl-CoA hydroxylase, with consequent accumulation of phytanic acid in tissues and serum of patients. The symptoms are reduced by restriction of dietary dairy products and meat from ruminants, which contain phytanic acid. Infantile Refsum's disease is a form of **Zellweger syndrome** and results from mutations in the PEX1, 2, 5, or 12 genes. *See alpha oxidation.*

Regan isozyme or Regan isoenzyme other name: carcino-placental alkaline phosphatase; an isoenzyme of alkaline phosphatase that is occasionally present in the plasma of patients with malignant tumours.

regeneration 1 (*in chemistry*) the process of restoring to a state of preparedness for use, as in the case of an ion-exchange resin washed with acid or alkali to restore it to the H^+ or OH^- form. **2** (*in biology*) the growth of new tissues or organs to replace ones lost or damaged, e.g. through injury or surgery. In some tissues, such as liver, epithelial tissue, or pancreas, regeneration occurs by simple duplication of cells, with the **regeneration time** varying from one week to a year. In other systems, such as epidermis, renewal is from specialized **stem cells**. Regenerating liver can be used as a model in which systems involved in proliferation are more highly activated than in normal liver. It is a unique property of liver that it is possible to remove two thirds of the organ yet it regenerates to form an organ of similar total weight to the original, albeit with somewhat different organization of the lobes. Many plants can regenerate a complete plant from a shoot segment or a single leaf or from tissue culture cells.

regeneration time the time taken for a tissue or organ to regain its former size or weight following damage or removal. For example, if two-thirds of the liver of a rat is removed surgically the liver regains its former weight in about two weeks. The proliferation of cells can be measured by the use of [3H]thymidine to label the cells synthesizing DNA.

regex *abbr.* for regular expression.

regio+ *comb. form* denoting, or relating to, an area or site.

regioselective pertaining to a chemical change that occurs with greater frequency at one site than at a number of other possible sites of similar type, usually involving a structural or positional isomer.

regiospecific describing a chemical reaction that occurs specifically

in only one of two possible ways, but not including stereospecificity (*see stereospecific*).

registration peptide one of the postulated extensions of the α chains of **tropocollagen**, when synthesis has just been completed; two $\alpha 1$ extensions and one $\alpha 2$ extension interact to form a stable assembly with the correct chains brought together into register.

regression coefficient *see regression line*.

regression line a line fitted to a series of two variable quantities, x and y , so as to minimize the sum of the squares of the distances parallel to the y axis of the observations from the line. The regression line of y on x has the equation (**regression equation**): $y = a + bx$ where $a = \frac{\sum y - b \sum x/n}{n}$ and b , the **regression coefficient**, is the slope of the line and is given by:

$$b = (n \sum xy - \sum x \sum y) / (n \sum x^2 - (\sum x)^2)$$

where n is the number of pairs of observations. In an analogous manner a regression equation, line, and coefficient may be obtained for x on y .

regucalcin a hepatic Ca^{2+} -binding protein, and also a GTP-binding protein, that modulates the hormonal regulation of plasma membrane Ca^{2+} , Mg^{2+} -ATPase.

regular expression *abbr.*: regex; a shorthand representation of the conservation in an aligned sequence motif. For proteins, the single-letter code is used to denote allowed or forbidden residues (or residue groups) at each position; wildcards (x) denote positions that are not conserved. For example, a regex that detects possible sites of N -glycosylation is N-P-[S,T]-{P}, which means that Asn is completely conserved at the first position, Pro is forbidden at the second and fourth, and Ser or Thr are allowed at the third. Regexs can provide characteristic signatures for protein families; they form the basis of the PROSITE and eMOTIF databases. *See also rule*.

regulation (*in metabolism*) control of the rate of a metabolic system, especially in intact organs and cells, as a result of interaction from components of related systems. A distinction is sometimes made between **control** and regulation, with the latter described as the maintenance of a variable (e.g. rate or concentration) at a constant value over time, in spite of fluctuations in external conditions. It is therefore linked to homeostasis. —**regulatory adj.**

regulator gene or regulatory gene any gene that does not contribute structural information to the proteins whose synthesis it controls, but that determines the production of a specific cytoplasmic substance, a **repressor**, that inhibits information transfer from a **structural gene** (or genes) to protein. It may control the synthesis of several different proteins, which are determined by a coordinated group of structural genes (*see operon*). Although, when it was put forward, the concept of the regulatory gene was helpful, it is now realized that the genome codes for many different proteins that control the transcription of the structural genes (*see, e.g., attenuators, transcription factors*), and that can be classed as gene-activator proteins; these will possess two domains, one to recognize a specific regulatory DNA sequence, the other to contact the transcription machinery.

regulator of G-protein signalling protein *see RGS protein*.

regulator-site hypothesis a hypothesis to explain the control of insulin release from pancreatic islet B cells by glucose. It postulates that the glucoreceptor is an enzyme that is activated (or inhibited) by glucose and catalyses the production from a precursor of an activator, which controls the release process. *Compare substrate-site hypothesis*.

regulatory enzyme an enzyme that regulates the rate of a metabolic pathway; under regulating conditions, it is the enzyme of lowest activity in the pathway. Commonly, the rate is altered either by variation in the amount of regulatory enzyme (as a result of increased or decreased synthesis or degradation), or by variation in its activity by covalent modification (often by phosphorylation or dephosphorylation by kinases or phosphatases) or by allosteric modifiers. Classic examples are **phosphofructokinase** and glycogen phosphorylase (*see phosphorylase*).

regulatory factor for X box *see RFX*.

regulatory gene *see regulator gene*.

regulatory sequence a sequence in a DNA molecule concerned with regulating the expression of a gene; e.g. a **promoter** or **operator**.

regulatory site a specific site on an enzyme that is distinct from the substrate-binding site and that binds a feedback inhibitor or other regulatory molecule. *Compare* **allosteric site**.

regulatory subunit any of the subunits of a heteromultimeric enzyme that has a regulatory rather than a catalytic function.

regulon a group of genes, whether linked in clusters or unlinked, that respond to a common regulatory signal.

rehydrate to restore water to material that has been lyophilized (*see* **freeze-dry**) or otherwise dehydrated.

reiterated describing nucleotide sequences that occur many times within a genome. These occur especially in higher organisms. *See also* **repetitive sequences**.

REL a gene family encoding transcription factors of the κ B family; *v-rel* is the oncogene of avian reticuloendothelial virus strain T (REV-T), encoding p69^{v-rel}. Rel and v-Rel form homo- or heterodimers that bind to **NF- κ B** motifs. v-Rel has lost two N-terminal amino acids and 118 C-terminal residues compared with Rel.

relA a gene in *Escherichia coli*, mutations in which can lead to a 'relaxed' phenotype in which amino-acid starvation fails to switch off ribosomal RNA biosynthesis. The gene product is an enzyme active in the presence of ribosomes and uncharged tRNA, and called GTP pyrophosphokinase, EC 2.7.6.5; *systematic name*: ATP:GTP 3'-pyrophosphotransferase; *other names*: pppGpp synthetase I; **stringent factor**; guanosine 3',5'-polyphosphate synthase; it catalyses a reaction between ATP and GTP to form guanosine 3'-diphosphate 5'-triphosphate and AMP. The product is referred to as pppGpp and is converted to ppGpp (guanosine 3'-diphosphate 5'-diphosphate), which is the active nucleotide in evoking the **stringent response**.

relational database a database in which data are stored in tables. Different aspects or properties of the data are embodied in different tables, but tables may contain overlapping information.

relational database management system *abbr.*: RDBMS; software that manages a **relational database**, and is optimized for rapid and flexible retrieval of data (e.g. MySQL, PostgreSQL, Oracle).

relative atomic mass or (*formerly*) **atomic weight** *abbr.*: *r.a.m.*; *symbol*: A_r . **1** (of an atom) the ratio of the mass, m_a , of the atom in question, to the atomic mass constant, m_u , which is one-twelfth of the mass of the nuclide ^{12}C ; i.e. $A_r = m_a/m_u$. A_r is a mass ratio, a pure number with no units. **2** (of an element) the ratio of the average mass, \bar{m}_a , of the atoms in a specified sample of the element in question, E , to the atomic mass constant, m_u ; i.e. $A_r(E) = \bar{m}_a(E)/m_u$. Since, in general, elements are mixtures of isotopes of differing nucleon numbers (mass numbers), an average mass of the atoms is required in this definition. Furthermore, the isotopic composition of many elements can vary with the origin of the sample and its treatments. Hence there are limits to the precision with which the values of the relative atomic masses of many elements can be given.

relative band rate or **relative band speed** *see* **R_b value**.

relative biological effectiveness *abbr.*: RBE; *an alternative term for quality factor*.

relative centrifugal force *symbol*: G ; the force acting on a particle in a centrifugal field expressed in multiples of the acceleration due to gravity, g . $G = \omega^2 r$, where ω is the angular velocity in rad s^{-1} and r the radial distance from the axis of rotation in m. ($G = 1440 \times \pi^2 \omega^2 r$ where ω is in revolutions per minute and r in cm.)

relative density *symbol*: d ; the ratio of the mass density of a substance, ρ , at a given temperature, to the mass density of a reference substance (usually water), ρ^0 at a reference temperature (usually 4°C); i.e. $d = \rho/\rho^0$.

relative formula mass the relative molecular mass as calculated from the formula of a compound.

relative molecular mass or **relative molar mass** or **molecular weight** *abbr.*: *r.m.m.*; *symbol*: M_r ; the ratio of the mass of a molecule, m_r , to the atomic mass constant, m_u , which is one-twelfth of the mass of the nuclide ^{12}C ; i.e. $M_r = m_r/m_u$. M_r is a mass ratio, a pure number with no units. The convention for indicating the size of a protein is thus ' M_r ' followed by a number without units, e.g. M_r 10000; the equivalent **molecular mass**, i.e. its mass in daltons, would be 10 kDa. *See also* **dalton**, **relative atomic mass**, **unified atomic mass unit**.

relative permittivity *symbol*: ϵ_r ; *formerly called* **dielectric constant**, the ratio of the permittivity of a substance, ϵ , to the permittivity of vacuum, ϵ_0 , i.e. $\epsilon_r = \epsilon/\epsilon_0$.

relaxation (*in chemistry*) the process of self-adjustment of a molecular system to a new state of minimum free energy following a disturbance.

relaxation kinetics a technique used to study rapid reactions in which a mixture at equilibrium is rapidly adjusted to a new set of conditions. The system is then observed as it approaches its new equilibrium, a process known as **relaxation**. The temperature-jump method is often used, whereby an electric discharge is used to increase the temperature by several degrees in a period of about 1 μs . *See also* **rapid-reaction kinetics**.

relaxation spectrometry the use of spectrometry to follow the kinetics of a reaction undergoing relaxation from a perturbation. *See* **relaxation kinetics**.

relaxed control a mechanism of control of plasmid replication in which replication of plasmids greatly exceeds that of the chromosome. *Compare* **stringent control**.

relaxed DNA circular DNA that is not supercoiled (*see* **supercoil**), and instead has an unwound loop. The supercoiled form is energetically favoured over the relaxed form. Since the supercoiled DNA is more compact it moves faster when centrifuged or upon electrophoresis, and so the two forms of DNA can be separated.

relaxed form *abbr.*: R form; one of two alternative quaternary structures of a protein, the other being the **tense form** (or taut form, *abbr.*: T form). These forms derive from the concept of two conformational states of a protein, which differ in their affinities for a ligand. Factors affecting the conformational equilibrium also influence the affinity of ligand-binding, and vice versa. Such factors may include the ligand itself, which could enhance or reduce the affinity of the protein, giving rise to **positive cooperativity** or **negative cooperativity** of binding respectively. The T form has a lower affinity for the substrate. For example, oxyhemoglobin is R, and deoxyhemoglobin is T; the binding of O_2 to the heme group causes the iron atom to move with respect to the heme plane, and this favours the move from T to R. *See also* **allosteric constant**, **Monod-Wyman-Changeux model (for allosteric compounds)**.

relaxed mutant a bacterial mutant that lacks the *rel* (*relaxed*) gene, which exerts a critical control over the **stringent response**. The *rel* mutant is unresponsive to amino-acid starvation, so that rates of RNA synthesis, for example, continue as before. *See also* **relA**.

relaxin a protein hormone ($M_r \sim 5600$) that is responsible in most mammals (including humans) for dilation of the symphysis pubis, softening of the cervix, and various other physiological changes prior to parturition. It is synthesized and stored in the corpus luteum. Like **insulin**, the hormone consists of two polypeptide chains linked by two disulfide bonds, with an intrachain disulfide bridge also present. Although otherwise dissimilar in primary structure, the two proteins have very similar tertiary structures. As with insulin, synthesis is thought to occur via an inactive, single-chain precursor, in this case **prorelaxin**, and storage is as granules in vesicles. *See also* **insulin-related growth factors**.

relaxin-like factor a protein, homologous with **relaxin**, that is synthesized by Leydig cells in the testis and by theca cells of ovarian follicles. It binds one of the G-protein-coupled membrane receptors for relaxin. Its physiological role is unclear.

release factor *abbr.*: RF or (*formerly*) R factor; a protein that participates in the release of a nascent polypeptide chain from a ribosome. There are two classes of release factor, one codon-specific and the other non-codon-specific. In bacteria, two codon-specific factors have been identified: RF-1, specific for UAG/UAA; and RF-2, specific for UGA/UAA. In eukaryotes, one such factor has been found, eRF-1. These factors act at the ribosomal A-site, and require polypeptidyl-tRNA at the P-site. In bacteria, the actions of RF-1 and RF-2 are aided by the non-codon-specific RF-3, which binds to guanine nucleotides. In eukaryotes, a similar factor, eRF-3, has been identified. The genes encoding RF-1 (*prfA*) and RF-2 (*prfB*) have been identified. Mutations in these genes often cause misreading of termination signals, increased frameshifting, and temperature-sensitive growth of the cells. *See also* **ribosome recycling factor**.

release-inhibiting factor or **release-inhibiting hormone** any polypeptide that inhibits the release of a hormone or hormones. An example is **somatostatin**.

releasing hormone or **releasing factor** any neuropeptide synthesized in the hypothalamus that is carried to the anterior pituitary where it regulates the production and secretion of the tropic hormones, e.g. thyrotropin, somatotropin, or the gonadotropins. In the anterior pituitary releasing hormones act via the **adenylate cyclase** system and are then degraded by proteolysis.

Relish an NF- κ B type of transcription factor of *Drosophila* that activates genes for antibacterial peptides. REL-110 is cleaved into an N-terminal REL-68, which enters the nucleus, and a C-terminal REL-49, which remains in the cytoplasm.

rem *symbol*: rem; a non-SI unit of (radiation) **dose equivalent**, equal to 0.01 J kg⁻¹ of irradiated human (or other mammalian) tissue. It is being superseded by the **sievert**; 1 rem = 10⁻² sievert. [Acronym for röntgen equivalent man (or mammal).]

REMI *abbr.* for restriction enzyme-mediated integration (*see* **insertional mutagenesis**).

remnant a fragment of a molecule, or other entity, remaining after partial degradation, especially **chylomicron** remnant.

remnant hyperlipidemia or **type III hyperlipidemia** or **familial betadysproteinemia** a combined hypercholesterolemia and hypertriglyceridemia due to excessive chylomicron and very-low-density lipoprotein (VLDL) remnants in plasma. It is often associated with cutaneous xanthomas and premature vascular disease. Hypothyroidism, obesity, and diabetes mellitus are frequently associated with the condition. Homozygosity for apoE-2 is a predisposing factor, and rare point mutations in apoE are the cause of an autosomal dominant form. *See* **hyperlipidemia**.

renal pertaining to, or of, the kidney.

renal rickets a condition occurring in older children and characterized by the skeletal changes of **rickets**, due to impairment of renal function allowing excessive loss of calcium and phosphate into the urine.

renaturation the return of denatured macromolecules (protein, DNA, etc.) to the conformation they maintained before denaturation. In the case of proteins, reversible denaturation may be brought about by disulfide reducing agents and urea; for nucleic acids, by heat or salts. *See also* **native state**.

renewal (of tissue) *see* **regeneration** (def. 2).

Renilla reniformis a species of soft coral, or sea pansy, that contains a **luciferase** enzyme (also found in the related species *R. mullerei*) responsible for producing a characteristic green fluorescence. The luciferase catalyses the oxidative decarboxylation of coelenterazine to produce coelenteramide and light emission with a spectral peak at 480 nm. The luciferase is used as a reporter gene in vectors for promoter assays.

renin or **angiotensin-forming enzyme** or **angiotensinogenase** EC 3.4.23.15; a glycoprotein aspartyl proteinase formed from prorenin in plasma and kidney. It is also produced by the submaxillary gland of certain strains of mice. It is highly specific for the Leu-|-Leu bond in **angiotensinogen**, which it cleaves to generate angiotensin I. In humans, renin is derived from a 406-amino-acid **preproprotein**; residues 1–23 are the signal peptide, and 24–66 are the propeptide. *Compare* **rennin**.

renin-angiotensin system a system involved in the control of blood pressure. **Renin**, secreted into the blood by the kidney in response to osmotic changes, anoxia, or kidney trauma, acts on angiotensinogen to release angiotensin I (AI) (*see* **angiotensin**). **Angiotensin-converting enzyme** forms angiotensin II (AII) from AI by release of His-Leu from the C-terminal end. AII stimulates release of the mineralocorticoid **aldosterone** from the glomerulosa cells of the adrenal cortex. Various nonapeptide analogues of AI inhibit converting enzyme and are used in the treatment of renin-dependent hypertension. *See also* **captopril**.

rennet an extract obtained from the stomachs of young mammals living on milk. It contains rennin (i.e. **chymosin**), an enzyme that clots milk and is used in cheese-making.

rennin *an alternative name for* **chymosin** (which is preferred because of possible confusion with **renin**). *See also* **rennet**.

R-enzyme or **starch debranching enzyme** an enzyme in plants that catalyses hydrolysis of α 1-6-glucan branch points in starch, in the reaction: branched α 1-4(α 1-6)-glucan + H₂O = linear α 1-4-glucans. The α 1-6 linkage acted on carries an α 1-4-glucan chain about four

residues long that cannot be cleaved by starch phosphorylase. These short chains become substrates for **D-enzyme**.

Reoviridae a family of double-stranded RNA viruses (class III in the **Baltimore classification**) with a segmented genome, infecting vertebrates, arthropods, and plants. The virion consists of a nonenveloped icosahedral particle, 60–80 nm across, and containing 10–12 segments of RNA together with **RNA-directed RNA polymerase**; the latter serves to transcribe the negative strand of each RNA molecule into mRNA. This family comprises six groups: the orthoreoviruses, orbiviruses, rotaviruses, cytoviruses, phyto-reoviruses, and Fijiviruses. No pathology is associated with the orthoreoviruses infecting humans, but rotaviruses cause gastroenteritis, and orbiviruses cause the disease blue tongue in sheep.

reovirus *see* **Reoviridae**.

rep an obsolete unit of **absorbed dose** of **ionizing radiation** of any kind, equal to the dose of radiation that, upon absorption by a given mass of living tissue, causes the same energy deposition as 1 röntgen of X- or gamma radiation, i.e. about 96 ergs per gram (0.0096 J kg⁻¹) of tissue. *See also* **rad**, **rem**. [Acronym for röntgen equivalent physical.]

Rep *abbr.* for Rab escort protein; either of two proteins (Rep-1 and Rep-2) that are ubiquitously expressed, mediate binding of Rab proteins (*see* **RAB**), and are involved in membrane trafficking. Rep-1 (95 kDa) is a subunit of the heterotrimeric geranylgeranyl transferase that prenylates Rab proteins (*see* **prenylation**). Deficiency arises from many mutations and causes choroideremia. Rep-2 (658 amino acids) is produced by an intronless gene and is homologous with Rep-1.

REP *abbr.* for repetitive extragenic palindromic sequence.

RepA the protein product of the *Escherichia coli* gene *repA*, which has a role in the replication of DNA in *E. coli*. Although the principal **DNA helicase** in *E. coli* is DnaB helicase, there is also a different 68 kDa monomeric protein, which has some helicase activity during certain life-cycle stages of the replication of single-stranded phages. The contribution of RepA protein to the host cell is less clear, but the rate at which *E. coli* replication forks propagate is reduced in *rep*-mutants.

repairase an enzyme concerned in the repair of an interrupted polynucleotide chain.

repair enzyme any enzyme responsible for the excision of **pyrimidine dimers**, which are formed on exposure of DNA to ultraviolet light, when adjacent pyrimidine residues on a DNA strand become covalently linked. Three enzymic activities are essential for the repair: (1) the complex of three proteins encoded by the *uvrABC* genes (*see* **uvr**) that detects the distortion produced by the pyrimidine dimer; (2) the UvrABC enzyme complex also has another activity, described as a specific excinuclease of the UvrABC complex, which cuts the damaged DNA strand eight nucleotides away from the dimer on the 5' side and four nucleotides away on the 3' side; (3) DNA polymerase I enters the gap to effect repair synthesis. Gaps are finally sealed by **DNA ligase**. *See also* **DNA repair enzyme**, **excision repair**, **recombinational repair**, **mismatch repair**.

repairosome the nucleotide excision repair (NER) complex of yeast that contains the majority of NER proteins.

repeated genes *see* **repetitive sequences**.

repeat-induced point (mutation) *see* **RIP**.

repeat sequence or **repeat 1** (*in DNA*) *see* **repetitive sequences**. **2** (*in proteins*) any sequence of the same amino-acid residue, or group of amino-acid residues, that is repeated in a polypeptide: e.g., the protein huntingtin, involved in **Huntington's disease**, contains a poly- glutamine tract, which can vary in size from 11–86 repeat units; and the primary structure of **collagen** is characterized by a G-x-P repeat unit. **3** the repeats of sugar residues often found in complex polysaccharides.

repeat unit a major periodicity in the structure of a molecule as deduced from X-ray diffraction patterns.

repetitive extragenic palindromic sequences or **palindromic units** palindromic sequences in repetitive DNA in *Escherichia coli* and *Salmonella typhimurium*. These are never found within a coding sequence. They are topoisomerase substrates and potential transcription terminators.

repetitive sequence a repeated sequence of nucleotides found in

the DNA of eukaryotes. There are various types. (1) **Satellite DNA** typically consists of tandem (head-to-tail) repeats of a few hundred nucleotides. It is so called because those first discovered had an unusual ratio of bases that made it possible to separate the satellite DNA from the bulk of the cell DNA in a centrifuge. (2) **Minisatellite DNA** consists of shorter tandem repeats. The **restriction fragment length polymorphisms** linked to many genes have short sequences of bases in common. rDNA (see **ribosomal DNA**) probes for these sequences are useful in the preparation of a profile of the genome of an individual (fingerprinting). (3) **Transposons** (transposable elements) also contain repeated sequences, often numbering several hundred copies. Primate DNA has large numbers of two types of transposable elements, L1 transposable elements and **Alu sequences**, which comprise about 300 bases. (4) **Repeated genes** for rRNA and histones, so that cells can synthesize large amounts of these vital products. In many cases repetitive sequences seem to be maintained solely by their ability to replicate within the genome (the '**selfish DNA hypothesis**'). Rather than conferring benefits their behaviour can sometimes result in loss of fitness to the host, as in some human genetic diseases; mutations can arise due to insertion of transposable elements, to chromosomal rearrangements induced by recombination between repeated sequences, or to amplification of microsatellite sequences.

replacement vector a **cloning vector** in which part of the normal genome is replaced by foreign DNA. For example, the lambda phage EMBL4 contains only two *Bam*HI cleavage sites and so the middle segment, or stuffer fragment, of the DNA can be removed leaving 72% of the normal genome. A suitably long DNA replacement between the two arms of lambda DNA enables such a recombinant DNA molecule to be packaged into a lambda particle. It contrasts with an **insertion vector** where the foreign DNA is incorporated at a single restriction site.

replica (*in electron microscopy*) a reproduction of the surface of an object. There are various ways by which the surface of an object, e.g. membrane of an organelle, may be examined by transmission electron microscopy by means of a replica. Such a replica may be obtained by evaporating a thin film of a heavy metal such as platinum on to the dried specimen. The metal is sprayed from an oblique angle in order to deposit a coating of uneven thickness because a shadow effect is created that gives the image a three-dimensional appearance. The organic material may be dissolved away to provide a replica of the surface of the specimen. Two other methods, **freeze-etching** and **freeze-fracturing**, employ frozen sections.

replica plating a technique for the production of identical patterns of bacterial colonies on a series of agar plates. The method uses velvet or other fabric stretched on a pad, which is then pressed onto a plate of bacterial cultures so that some bacteria from each colony are transferred to the pad, preserving the spatial pattern of the colonies (in mirror image). If this pad is then pressed lightly onto a fresh culture plate, it will transfer colonies in the same formation to the new plate. This new plate may be prepared using media that will be selective for certain mutants, fermentation reactions, or antibiotic sensitivity. A similar technique can be used in the screening of **hybridomas** for antibody production.

replicase a *loose term* for certain polymerase enzymes; e.g. certain viral **RNA-directed RNA polymerases** can be referred to as RNA replicases.

replicate 1 to make an exact copy of something, as in the **replication of DNA**. **2** (*in electron microscopy*) to make a **replica**.

replication bubble or **replication eye** an *alternative term* for the **theta structure**.

replication complex the complex of replication proteins that are linked together as a single large unit, of total mass 10^6 daltons, that moves rapidly along the DNA during **replication of DNA**. It allows DNA to be synthesized on both sides of the replication fork in a coordinated and efficient manner. That part of the complex that contains **DNA primase** and **DNA helicase** is known as the **primosome**.

replication-error mutation a mutation that arises during DNA replication as a result of the incorrect copying of the sequence of nucleotides in the parent DNA. Probably fewer than one mistake occurs in 10^9 nucleotides added.

replication fork or **replicating fork** the Y-shaped region of a repli-

cating DNA molecule or chromosome, resulting from separation of the DNA strands and in which synthesis of new strands takes place. The process requires the participation of **helicases** that open the duplex.

replication of DNA the means whereby new strands of deoxy-poly-nucleotides are synthesized. The structure of DNA, i.e. two strands of complementary base pairs, led Watson and Crick to propose that the two strands could unwind and each act as the template for a new strand, thus forming two helices, each containing one parental strand and one new one. The elegant **Meselson-Stahl experiment** demonstrated that DNA replication was indeed semiconservative. Unwinding of parental DNA requires more than 20 proteins in a complex known as a **primosome**. All DNA-dependent DNA polymerases synthesize the new strands in the direction 5' to 3' using as substrates deoxynucleoside triphosphates with the production of pyrophosphate. The new strands are antiparallel to the parental template strand. One strand, the **leading strand** (*or* continuous strand), is synthesized in a continuous fashion whereas the other strand, the **lagging strand** (*or* discontinuous strand), is synthesized discontinuously to give **Okazaki fragments** (1000–2000 nucleotides long in prokaryotes and 100–200 nucleotides long in eukaryotes) which are eventually joined by **DNA ligase**. The DNA polymerases cannot start a chain and must rely on a priming device; this is provided by RNA **primase**, which again synthesizes an RNA primer in the direction 5' to 3' using nucleoside triphosphates as substrate. The continuous strand needs to be primed only once whereas the discontinuous strand must be primed repeatedly. Three principal **DNA polymerases** for *Escherichia coli* were discovered in the laboratory of US biochemist Arthur **Kornberg (1918–)**. **DNA polymerase I**, in addition to possessing synthetic activity *in vitro*, is also a 3'-5' **exonuclease** which gives it an editing function. It also has 5'-3' nuclease activity. **DNA polymerase II** participates in DNA repair but is not required for replication. **DNA polymerase III** is the predominant polymerase for replication of *E. coli* DNA *in vivo*. Eukaryotic cells have at least four DNA polymerases.

replicative able to be replicated. *See also* **replicative form**.

replicative form *abbr.*: RF; the intracellular form of viral nucleic acid that is active in replication. A single-stranded viral nucleic acid, be it RNA or DNA, is first converted into a double-stranded form – the **replicative intermediate** – to enable the viral strand to be replicated preferentially. In the case of a **retrovirus** a hybrid of RNA and DNA is formed.

replicative intermediate *see* **replicative form**.

replicon 1 a structural gene that controls the initiation and replication of DNA. **2** by association, the whole DNA sequence (such as the bacterial chromosome) that is replicated under the influence of a single replicon system.

replisome a multiprotein complex that includes two DNA polymerase molecules for synthesis of the leading and lagging strands at the site of origin of DNA replication. *See* **replication of DNA**.

replisate a particulate fraction that can be isolated from the nuclei of **S phase** Chinese hamster embryo fibroblasts and containing some of the enzyme activities required for DNA synthesis.

reporter gene a gene used to disclose the function of potential regulatory sequences. The sequences are placed in plasmids, upstream of the reporter gene; these chimeric plasmids are then introduced into cells and the expression of the reporter gene is measured as an index of the function of the regulatory sequences under the conditions being investigated. The *lacZ* (**β -galactosidase**) gene, the *CAT* gene (see **chloramphenicol O-acetyltransferase**), and the gene encoding firefly **luciferase** have been used in this way.

reporter group a chemical group that acts as a **probe**.

repress to check or restrain; the effect may be partial or total. *See* **repression**, **repressor**.

repressible describing a metabolic reaction that is capable of undergoing **repression**.

repression (*in genetics*) the act of inhibiting gene expression. An example is **catabolite repression** of the *lac* operon by glucose, mediated through binding of cyclic AMP to **catabolite (gene) activator protein (CAP)**. By extension, the gene product itself (enzyme or other protein) and thus any associated metabolic reaction is said to be repressed. *See also* **repressor**.

repressor (*in genetics*) a molecule that specifically prevents the transcription of regulatory genes under control of an **operator**. When the repressor binds the operator, transcription cannot occur. An inducer induces transcription by binding to the repressor to form a complex that has a low affinity for the operator. The classic example is the lactose repressor protein, which controls the expression of the **lac operon** in *Escherichia coli*. The protein binds to a specific sequence of 21 nucleotide pairs (called the operator) that overlaps an adjacent RNA polymerase binding site (the promoter) at which RNA synthesis begins. In the presence of lactose, allolactose is formed, which binds to the repressor. This induces a conformational change that causes the repressor to loosen its hold on the DNA so that the gene is derepressed. In other examples, the binding of a signalling molecule may increase the affinity with which the repressor binds to the DNA; e.g. the *trp* operon, encoding enzymes that produce tryptophan in *E. coli* (see **trp gene**). See also **repression**.

reproducibility the ability to carry out a series of identical experiments to yield results that fall within a small range of error derived by statistical analysis (see **standard deviation**, **standard error of the mean**). The limits of error that are acceptable depend on the limitations of experimental technique and the inherent variability of the system under investigation.

reproduction (*in biology*) the production by an organism of new individuals that are more or less similar to itself. Reproductive strategies can be divided broadly into two categories: sexual reproduction, which requires the participation of male and female **gametes** and gives rise to genetic variation among the offspring; and asexual reproduction, which does not involve gametes and leads to the formation of offspring that are genetically identical to the parent. The latter takes various forms; examples include **budding**, **fragmentation**, **parthenogenesis**, **spore** formation, and **vegetative reproduction**.

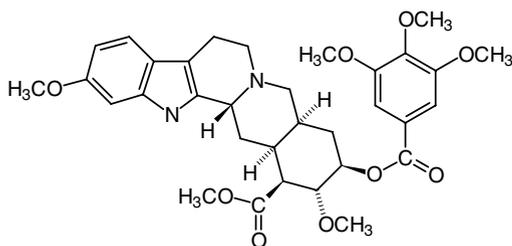

reptation a term invoked to rationalize the movement and thermodynamics of linear polymers, dividing the chain conceptually into sections (**reptons**), which form the basis for statistical mechanical calculations of the relaxation time of the polymer and viscosity of polymer solutions. Large DNA molecules move through the pores of agarose gels by reptation.

repton see **reptation**.

RER *abbr.* for rough endoplasmic reticulum.

reseal to join again the ends of ruptured components, as in, e.g., the resealing of plasma membranes after whole cells have been rendered permeable by various techniques, or of fractionated membrane fragments, which may reseal to form closed vesicles. The term can also refer to ligation of the cut ends of DNA after insertion of foreign DNA into a vector.

reserpine ($3\beta,16\beta,17\alpha,18\beta,20\alpha$)-11,17-dimethoxy-18[(3,4,5-trimethoxybenzoyl)oxy]yohimban-16-carboxylic acid methyl ester; an alkaloid isolated from the roots of certain species of *Rauwolfia* and noted for its antihypertensive and CNS depressant actions. These arise from its inhibition of the intraneuronal Na^+ , Mg^{2+} -ATPase pump, which maintains the neuronal vesicular stores of biogenic monoamines (**dopamine**, **norepinephrine**, and **serotonin**).

reserve polysaccharide any polysaccharide that is stored to provide an energy source at times of need. Examples are starch granules in plants, and glycogen granules in animals.

Re/Si convention a nomenclatural system for specifying the **stereoheterotopic** faces of a trigonal atom using the **sequence rule** in two di-

mensions. This is used to establish a priority sequence for the three ligands, e.g. of *Cabc*. The plane containing C and the first atoms of the ligands is then inspected from an arbitrarily chosen side. Starting with the highest priority ligand, it is determined whether the priority sequence is clockwise, hence *re* (from Latin *rectus*, right), or counterclockwise, hence *si* (from Latin *sinister*, left); e.g. for acetaldehyde, CH_3CHO , if the face inspected shows a clockwise ordering, $\text{O} \rightarrow \text{CH}_3 \rightarrow \text{H}$, that face is designated *Re*. There are a number of extensions of this general principle, and the specialist literature should be consulted for details.

residence time the averaged time that a site is occupied by any designated molecule.

resident protein see **luminal protein**.

residual body a membrane-lined cytoplasmic inclusion characterized by undigested residues (e.g. membrane fragments or whorls, ferritin-like particles). The term embraces **telolysosome** and (hypothetical) **post-lysosome**.

residue 1 any of the incorporated amino-acid moieties in a peptide or protein. **2** material that remains after any procedure to remove something.

residue mass the relative molecular mass of a residue; i.e. the sum of the **relative atomic masses** of all the atoms composing the residue.

residue weight the molecular weight of a residue; i.e. the sum of the **atomic weights** of all the atoms composing the residue. **Residue mass** is the preferred term.

resin 1 or **rosin** any of a group of naturally occurring amorphous solids or semisolids, typically light yellow to dark brown, brittle, and insoluble in water. They are found as plant exudates, often on trees such as pines and firs. **2** the polymer base of certain ion-exchange materials used in chromatography. See **ion-exchange polymer**.

resistance 1 the ability of a living organism, particularly a bacterium, to resist the effect of a disadvantageous environment or substance, especially an antibiotic. A bacterium may possess one or more resistance plasmids. **2** see **electric resistance**.

resistance donor a strain of an organism, usually a bacterium, that is capable of transferring resistance, usually by conjugation, to a suitable recipient.

resistance factor *abbr.*: R factor; *an alternative name for resistance plasmid*.

resistance plasmid *abbr.*: R plasmid; a **plasmid** that carries genetic information for resistance to antibiotics or other antibacterial drugs. *Other name*: resistance factor (*abbr.*: R factor).

resistin or **FIZZ 3** a protein, related to FIZZ 1, that is secreted by white adipose tissue into the bloodstream. The mouse protein contains two identical subunits (each of 114 amino acids) joined by a disulfide bond. There are three murine and two human homologues, which show $\approx 53\%$ sequence identity. In obese mice, serum levels of FIZZ 3 are high and are decreased by thiazolidinedione drugs, which increase sensitivity to insulin in various tissues. Antibodies to resistin lower blood glucose levels and improve insulin sensitivity in these mice. See **FIZZ**.

resolution 1 the degree of separation between two compounds being subjected to a transport method such as chromatography or sedimentation equilibrium (i.e. being resolved); complete resolution yields two compounds each uncontaminated by the other. **2** (*in physics and biophysics*) the extent to which closely juxtaposed objects can be distinguished as separate objects using an optical instrument, e.g. a microscope. The degree of resolution is dependent on the **resolving power** of the system. The fineness of detail with which objects can be seen is limited by the wavelength of light used. Only those objects similar in dimensions to the wavelength of the light (or larger) can be resolved. The wavelength of X-rays is from about 10^{-8} m to 10^{-11} m and they can thus be used to resolve structures at the atomic level. Thus a structure can be said to have been determined at 3 Å resolution, 7 Å resolution, etc.

resolvase an enzyme that, together with **transposase**, is involved in the replicative transposition of genetic elements in *Escherichia coli*. The 3' ends of the target chromosome, after the first cutting and splicing, serve as replicative primers for copying both the gaps and the two strands of the transposable element (which contains transposase) itself. Ligase action generates a cointegrate, a large circular

structure containing both donor and target chromosomes with two freshly replicated copies of the transposable element. Resolvase now catalyses the site-specific recombination between the two elements, resulting in one copy of the transposable element inserted in each of the two chromosomes.

resolving power 1 (*in chromatography*) the power to resolve individual compounds (*see resolution*(def. 1)). It depends on (1) the efficiency of the system employed; for columns this is given by the **theoretical plate** number; and (2) the relative affinities of different compounds for the stationary and mobile phases. **2** (*in physics*) **a** the ability of an optical instrument, e.g. a microscope or telescope, to produce separate images of objects placed close together. **b** the ability of a spectrometer to separate adjacent peaks in a spectrum.

resonance 1 (*in physics*) the induction or amplification of one vibration by another vibration of a periodicity equal to the natural oscillation frequency of the first, which is then said to *resound*. In an electronic circuit, resonance occurs when an applied emf equals the natural frequency of oscillation of the circuit (used, e.g., in tuning a radio receiver). **2** (*in chemistry*) a phenomenon shown by any molecular entity to which more than one **contributing structure** can be assigned, when these structures are of similar energy and differ only in the distribution of the valence electrons; the entity then oscillates between the two structures and adopts, in effect, an intermediate state. Resonance always results in a different distribution of electrons than would be the case if there were no resonance. *See also resonance energy, resonance hybrid.* **3** *see electron spin resonance spectroscopy, nuclear magnetic resonance.* —*resonant adj.; resonate vb.*

resonance energy the difference in energy of an actual molecule and the **contributing structure** of lowest energy.

resonance hybrid the structure that results when a chemical entity exhibits **resonance** (def. 2), such as occurs by the sharing of one or more electrons over several bonds. It has a lower energy than any of the possible formal nonresonance **contributing structures**, giving additional stability of which the so-called **resonance energy** is a measure. A classic example is carbon dioxide, which may be represented by the **Lewis formula** for each as $\ddot{O}::O::\ddot{O}$, $::\ddot{O}:C::O^+$, and $+:O::C:\ddot{O}:-$. *Compare mesomerism.*

resonance Raman spectroscopy a spectroscopic technique for characterization and assignment of vibrations directly connected with a **chromophore**, as well for the assignment of the chromophore. The excitation frequency is applied close to the absorption maximum of the chromophore.

resonance stabilization or **resonance stabilisation** stabilization of molecular structure by resonance; *see also resonance hybrid.*

resonate *see resonance.*

resorb to absorb again. —*resorbent adj.; resorption n.; resorptive adj.*

resorcinol *m*-dihydroxybenzene; a compound used in the **Seliwanoff test** for ketoses.

resorption *see resorb.*

RESOURCERER a database for annotating commonly available microarray resources.

respiration 1 the process of gaseous exchange between an organism and its environment. In plants, microorganisms, and many small animals, air or water makes direct contact with the organism's cells or tissue fluids, and the processes of diffusion supply the organism with dioxygen and remove carbon dioxide. In larger animals the efficiency of gaseous exchange is improved by specialized respiratory organs, such as lungs and gills, which are ventilated by breathing mechanisms. These organs possess respiratory surfaces, across which gases are exchanged with the blood or other transport medium. This then carries dioxygen to the body tissues, and removes carbon dioxide. **2** or **oxidative metabolism** the various energy-yielding reactions of cells or organisms that require oxygen as the final electron acceptor. *See respiratory chain.* —*respiratory adj.*

respiratory burst a phase of elevated oxygen consumption that occurs in neutrophils, monocytes, and macrophages shortly after phagocytosing material. This is associated with increased activity of the hexose monophosphate shunt and production of **NADPH** (*see pentose phosphate pathway*). An NADPH oxidase complex passes

electrons from the NADPH to O_2 creating the reactive superoxide (O_2^-) ion and H_2O_2 in the vacuole. Patients with chronic granulomatous disease never produce a respiratory burst. The patients suffer an accumulation of mononuclear cells at sites of chronic inflammation, forming granulomas. *See phagocyte NADPH oxidase.*

respiratory chain or **electron-transport chain** the sequence of enzymes and other proteins within the mitochondrion and prokaryotic cell membranes by which substrates, including NADH and succinate, are oxidized by dioxygen. It is fundamental to tissue **respiration** (def. 2) which has the function of maintaining tissue metabolism through **oxidative phosphorylation**. The chain can be separated into a number of particles (*see respiratory complex*) each of which contains individual elements of the chain. The mechanism involves, in the case of NADH, removal by NADH dehydrogenase of a proton plus two electrons. In the case of succinate, there is a transfer of two hydride ions (i.e. two protons plus two electrons) by succinate dehydrogenase to ubiquinone; other flavoproteins can similarly oxidize fatty acyl-CoA or β -hydroxybutyrate or α -glycerophosphate. The protons are initially released to the intermembrane space, and the electrons are transferred by the appropriate flavoprotein to ubiquinone, from which they are transferred singly in sequence to cytochrome *b*, cytochrome c_1 , cytochrome *c*, and cytochrome *ala₃* at which point they reduce molecular oxygen to promote formation of water with the protons that were formed earlier. Many other components are also involved. In tightly coupled mitochondria, the protons released to the intermembrane space reach the mitochondrial matrix (the space in which they react with molecular oxygen) by transfer through the inner mitochondrial membrane by the F_0F_1 complex of the mitochondrial ATPase (*see H⁺-transporting ATP synthase*), with concomitant phosphorylation of ADP to ATP. *See also chemiosmotic coupling hypothesis.*

respiratory complex any of several groups of physically associated components of the **respiratory chain**. The concept arose during experiments to purify individual components, when it was found that membrane particles could be isolated each with a consistently characteristic composition. Four main complexes have been identified: complex I, which contains primarily NADH dehydrogenase; complex II, which contains succinate dehydrogenase; complex III, which contains cytochromes *b* and c_1 ; and complex IV, which contains cytochrome *ala₃* together with copper-containing proteins. Complexes I, II, and III all contain additionally a number of proteins rich in iron and sulfur. The F_0 and F_1 subunits of the ATPase associated with the respiratory chain have been termed complex V (*see H⁺-transporting ATP synthase*). *See also complex I, II, III, IV.*

respiratory control the regulation, in coupled mitochondria, of the rate of oxidative phosphorylation by the level of ADP. As the ADP level increases, and the ATP level falls, electron flow through the **respiratory chain** and coupled ATP synthesis are enhanced. The **respiratory control ratio**, or **respiratory control index**, represents the ratio of the rate of oxygen consumption of mitochondria in the presence of both substrate and ADP to the rate in the presence of substrate but the absence of ADP; i.e. the ratio of the rate in respiratory state 3 to respiratory state 4 (*see respiratory state*).

respiratory pigment any of a number of pigmented proteins, associated with respiratory processes, that derive their colour from a prosthetic group, usually heme in red proteins such as cytochrome *c*, or flavin nucleotides in flavoprotein dehydrogenases, which are yellow.

respiratory quotient or **respiratory ratio** *abbr.*: RQ; a ratio of the rate of carbon dioxide evolution by any cell, tissue, or organism to its rate of dioxygen uptake.

respiratory state or **state of the respiratory chain** any one of the possible steady states of the phosphorylating **respiratory chain** in mitochondria. In state 1 both ADP and respiratory substrates are lacking. State 2 is a 'standard state' in which ADP has been added to exhaust the endogenous respiratory substrate; in state 2' substrate has been added to exhaust the endogenous ADP. In state 3, the 'active' state of rapid respiration, all required components are present and the respiratory chain itself is the rate-limiting factor. State 4, an anaerobic 'resting' state, is characterized by a low respiration rate. In state 5, only oxygen is lacking, the respiration rate then being at zero.

State	[O ₂]	[ADP]	Substrate level	Respiration rate	Rate-limiting factor
1	>0	low	low	slow	ADP
2	>0	high	0	slow	substrate
2'	>0	low	high	slow	ADP
3	>0	high	high	fast	respiratory chain
4	>0	low	high	slow	ADP
5	0	high	high	0	O ₂

respirometer an instrument for measuring the uptake of oxygen during incubation experiments. The **Barcroft apparatus** and the **Warburg apparatus** were examples of this type of instrument.

response the events brought about by a **stimulus**, especially in a cell, tissue, or organism. *See* **stimulus–response coupling**, **sensitization**, **desensitization**.

response coefficient *symbol: R*; an overall measure of the control exercised by a specific enzyme inhibitor, at its concentration, *I*, on the overall flux, *F*, of a multienzyme system. Hence,

$$R_I^F = (\partial F/F)/(\partial I/I)$$

or

$R = \text{fractional change in flux/fractional change in inhibitor.}$

A response coefficient can also be determined for the effect of *I* on the concentration of a metabolite *S*. Thus

$$R_I^S = (\partial S/S)/(\partial I/I)$$

It is the product of the **elasticity coefficient** and the **flux control coefficient**.

response element *abbr.: RE*; a DNA sequence (sometimes called a ‘module’) that is common to promoters/enhancers of genes whose expression is coordinately regulated (*see* **coordinate induction/repression**). Examples: the **estrogen response element** (ERE) has the consensus sequence GGTCANNTG[A/T]CC; the glucocorticoid response element (GRE) has the consensus sequence TGGTACAAATGTTCT; the **heat-shock response element** (HSE) has the consensus sequence GNNGAANNTCCNNG; the **metal response element** (MRE) has the consensus sequence CGNCCCG-GNCNC; the **serum response element** (SRE) has the consensus sequence CATATTAGG; and the **thyroid response element** (TRE), which is common to several enhancers, has the consensus sequence TGACTCA. RE-1 (or NRSE) is a conserved 21–23 bp response element present in neuron-specific genes. *See* **REST**.

response regulator part of a **two-component signal transduction system**. Response regulators of bacterial sensory transduction systems generally comprise a receiver module domain covalently linked to an effector domains. In the presence of an effector molecule, a **histidine sensor kinase** phosphorylates an aspartate residue in the receiver module. Effector domains include DNA binding and/or catalytic units that are regulated by phosphorylation of the receiver module.

response time the interval between initiation of a process and the commencement of the action that it induces.

responsiveness (*in physiology*) the ability of a cell, tissue, or organ to undergo a response. Maximal response normally corresponds to the healthy *in vivo* state, so that the degree of response is an indication of the integrity of the preparation. However, negative regulators may be removed during tissue preparation, thus giving enhanced activity *in vitro*.

REST *abbr. for response element RE-1 silencing transcription factor; other name: neuronal restricted silencing factor (abbr.: NRSF)*. A transcription factor (116 kDa) that contains a central DNA-binding domain comprising eight zinc fingers and flanked by two repressor domains. It binds a 21–23 bp conserved response element called response element-1 (RE-1), or neuronal restricted silencing element (NRSE). This element is present in neuron-specific genes, and binding of REST represses the expression of such genes. The N-terminal domain of REST associates with a histone deacetylase

and other proteins (depending on the genetic context). The C-terminal domain associates with a corepressor (called CoREST), which serves as a **molecular beacon** for the assembly of other components of the repressor machinery.

restin Reed–Sternberg cell intermediate filament-associated protein; *other name: cytoplasmic linker protein-170 α -2 (abbr.: CLIP-170)*; a protein that is highly expressed in such cells in Hodgkin’s lymphoma, and having a large coiled-coil α -helical domain similar to those in myosins.

resting potential the potential difference across the membrane of a cell in the unstimulated state. *See also* **membrane potential**.

resting state an inactive or unstimulated state, especially of a cell. *See also* **cell-division cycle**.

restricted DNA DNA that has been cut by a **restriction endonuclease** within a bacterium; bacteria are protected from the propagation within them of foreign DNA, usually viral DNA, by the possession of restriction endonucleases which degrade the invading DNA. Each nuclease recognizes a specific sequence of 4–8 nucleotides in the DNA. The cleaved sequences, where they occur in the genome of the bacterium itself, are protected from cleavage by methylation at the amino group of an adenine, or either the 5 position of a cytosine or the amino group of a cytosine. The newly replicated strand of the bacterial host DNA, which is protected from degradation by the methylated parent strand with which it forms a duplex, is modified before the next cycle of replication (*see* **restriction–modification system**). Such sequences in the viral DNA are usually not so methylated and hence are degraded first by the restriction enzymes and then by bacterial exonucleases. Invading DNAs are only rarely modified and enabled to reproduce in their new host. Its progeny are, however, no longer modified in the way that permits them to propagate. *See also* **host-controlled modification**.

restricted phage or **restricted bacteriophage** *see* **restricted virus**.

restricted virus a virus whose host range is limited by **host-controlled modification** so that when it infects a related but nonidentical host cell its DNA is degraded by the new host cell’s **restriction endonucleases**.

restriction (*in molecular biology*) the action or use of **restriction endonucleases**. *See also* **restrictive**.

restriction analysis *another term for restriction mapping*.

restriction endonuclease or **restriction enzyme** or **restriction nuclease** any of a group of enzymes, produced by bacteria, that cleave molecules of DNA internally at specific base sequences. They therefore act to ‘restrict’ the replication of foreign, usually viral, DNA entering the bacterial cell (*see* **restricted DNA**). Some of them also methylate the host bacterial DNA to protect it from degradation. There are three known types of restriction enzymes. Types I and III each carry activity for both the endonuclease and methylase function whereas type II enzymes do not carry the methylase activity. Type I enzymes cleave the DNA at a random site located at least 1000 bp from the recognition sequence, type III do so 24–26 bp distant from the recognition site. In contrast, type II enzymes cleave DNA at specific sites within the recognition sequence. This makes type II enzymes indispensable for DNA manipulation. Around 2500 species of type II restriction enzymes with some 200 differing sequence specificities have been characterized. A restriction endonuclease is named by a three-letter abbreviation of the species from which it was originally isolated, followed by letters and/or numerals indicating the strain or characteristic, e.g. *EcoRI* is derived from a strain of *Escherichia coli* with an R (drug resistance) marker and is enzyme I thus described.

Type I (EC 3.1.21.3) restriction and modification enzymes are complex multifunctional systems that require ATP, *S*-adenosylmethionine, and Mg²⁺ as cofactors; in addition to their endonucleolytic and methylase activities, they are potent DNA-dependent ATPases. The subunit composition, comprising three subunits designated R, M, and S, is similar to that of ATPases. They catalyse the endonucleolytic cleavage of DNA to give random double-stranded fragments with terminal 5′-phosphates; ATP is simultaneously hydrolysed.

Type II enzymes have activity as site-specific deoxyribonucleases (EC 3.1.21.4), which catalyse the endonucleolytic cleavage of DNA to give specific double-stranded fragments with terminal 5′-phos-

phates; Mg^{2+} is a cofactor. Such enzymes are the basis of **restriction mapping**.

Type III enzymes have activity as site-specific deoxyribonucleases (EC 3.1.21.5). The protein has two subunits, products of the *res* (from 'restriction') and *mod* (from 'modification') genes; these are, respectively, responsible for binding the system-specific DNA recognition site and the methylation of one of the adenosyl residues in the recognition site. The more widely used restriction enzymes appear in the body of the dictionary and their activity is indicated by the following convention. As an example *AatII* has the recognition sequence GACGT \uparrow C meaning that the sequence on one strand is 5'-GACGTC-3' and that the cleavage site is on the 3' side of the T preceding the \uparrow symbol. This is thus an example of an enzyme that will result in restriction fragments with a 3' 'sticky end'. Some enzymes have an ambiguous recognition sequence, e.g. *AclI*, and for these this dictionary uses a convention of square brackets. Thus the sequence in this example is GT \uparrow [AC][GT]AC meaning that the third nucleotide is either A or C and the fourth is either G or T. A different type of ambiguity is illustrated by *BglI*.

restriction enzyme an alternative name for **restriction endonuclease**.

restriction fragment a fragment of DNA produced by the action of a **restriction endonuclease**. It usually refers to the product of a type II enzyme that recognizes specific base sequences in double-helical DNA and cleaves both strands of the duplex at specific sites.

restriction fragment length polymorphism *abbr.*: RFLP; **polymorphism** within a population of organisms of the size of the fragments of DNA produced by the action of a type II **restriction endonuclease**. It results from a corresponding polymorphism of **restriction sites** in the genome, due to slight differences in base sequence between individual members of the population. RFLP is exploited in constructing physical maps of the genome, and widely used for localizing specific genes and detecting genetic differences between closely related individuals. Such polymorphisms can be detected by Southern blotting using a DNA probe for a particular locus to reveal differences in the sizes of fragments produced by a particular endonuclease. The analysis of restriction fragments can reveal the presence of a mutation that may itself cause disease or be closely linked to one that does; for example, genetic diseases such as sickle-cell anemia, cystic fibrosis, and Huntington disease can be detected by RFLP analyses. *See* **restriction mapping**.

restriction map a pattern obtained as the result of **restriction mapping**.

restriction mapping the use of type II **restriction endonucleases** to cleave genomic or other DNA to produce a characteristic pattern of fragments. The fragments are resolved by gel electrophoresis and visualized. Every DNA molecule produces a unique pattern, which accords with the specificity of the particular restriction enzyme. By comparing the patterns obtained from two or more different DNAs, differences between closely similar DNA molecules, such as arise from mutations, may be detected. The use of DNA probes, such as cDNA, to identify particular fragments may often be of value. By using restriction enzymes singly and in pairs it is possible to deduce from the sizes of resulting fragments the order of the restriction sites on the DNA and the distances between them.

restriction-modification system any system whereby host DNA is methylated to render it resistant to the action of the cell's **restriction endonucleases** (*see* **restricted DNA**); methylation involves the adenine or cytosine residues at the restriction sites. Several enzymes are implicated: (1) EC 2.1.1.72; *recommended name*: site-specific DNA-methyltransferase (adenine-specific); *other names*: N-6 adenine-specific DNA methylase; modification methylase; it catalyses a reaction between S-adenosyl-L-methionine and DNA adenine to form S-adenosyl-L-homocysteine and DNA 6-methylaminopurine. (2) EC 2.1.1.73; *recommended name*: site-specific DNA-methyltransferase (cytosine-specific); *other names*: C-5 cytosine-specific DNA methylase; modification methylase; it catalyses a reaction between S-adenosyl-L-methionine and DNA cytosine to form S-adenosyl-L-homocysteine and DNA 5-methylcytosine.

restriction negative describing an organism that does not contain any **restriction endonuclease**.

restriction site a sequence of bases in a DNA molecule that is recognized by a **restriction endonuclease**.

restrictive 1 describing a strain or line of cells that does not permit the replication of a particular viral DNA, and is thus resistant to infection. **2** describing a set of conditions, such as a temperature range, in which a mutant phenotype is expressed, thus limiting the growth of the organism or causing its death. *Compare* **permissive**. *See also* **conditional lethal mutation**, **temperature-sensitive mutation**.

restrictive conditions *see* **conditional lethal mutation**.

restrictive temperature *see* **temperature-sensitive mutation**.

restrictocin an antitumour polypeptide (16 kDa) from *Aspergillus* spp. It cleaves the large RNA of the eukaryotic 60S ribosomal subunit and inhibits protein synthesis in picornavirus-infected cells.

resveratrol a stilbene **phytoalexin** produced by the grapevine and present in the skin of red grapes, red wine, and other plant sources. It is a potent antioxidant and claims have been made for its antitumour activity.

RET *abbr.* for rearranged during transfection; a human transforming oncogene derived through fibroblast transfection with T-cell lymphoma DNA. It encodes a receptor-tyrosine kinase present in the central and peripheral nervous systems. Several isoforms are produced by alternative splicing. RET is recruited by GPI-anchored membrane proteins specific for the structurally related secreted proteins glial cell-derived neurotrophic factor, neurturin, and persephin. It signals through the adaptor protein GRB-19. Activating mutations in RET are associated with multiple endocrine dysplasia, and inactivating mutations with Hirschsprung disease.

retentate or **dialysis residue** or **residue** (*in dialysis*) the moiety of the dialysed material that has not traversed the membrane; the liquid containing this moiety (which may or may not still be entirely in solution). Some authorities prefer the term **nondiffusible material**.

retention coefficient (*in column chromatography*) the ratio of the **void volume** to the **elution volume** for a specific solute. It is a measure of the partition of the solute between the column material and the solvent, and is independent of column size.

retention time the time taken by a compound to traverse the length of a **gas-liquid chromatography** column. The retention time is a characteristic of each compound under defined conditions. It can be used to aid in identification within a series of homologues, e.g. fatty acids, which are characterized by their **carbon number** derived from the retention time.

retention volume a parameter of liquid chromatography, related to the volume at which each compound elutes under defined conditions.

retGC-1 *abbr.* for retinal guanylate cyclase 1. *See* **guanylate cyclase**.

RETGC protein *abbr.* for retinal guanylyl cyclase protein; *other name*: photoreceptor-specific membrane protein; either of two type I integral membrane proteins (RETGC1 and RETGC 2) of the retina that contain an N-terminal ligand-binding region, a transmembrane helix, an intracellular protein kinase homology domain, and a guanylyl cyclase domain. They form heterodimers, do not bind natriuretic peptides, but are activated by retinal guanylyl cyclase activator proteins (GCAP1 and GCAP2) that belong to the calmodulin family. Mutations in the RETGC1 gene cause Leber's congenital amaurosis.

reticulate 1 or **reticular** resembling a net; in the form of a network. **2** to create in the form of a net or network. —**reticulation** *n*.

(S)-reticuline a benzoisoquinoline that is the metabolic precursor of several tetrahydrobenzylisoquinoline alkaloids including (from *Papaver somniferum*): codeine, noscapine, papaverine, and morphine. It is derived from two molecules of tyrosine and three molecules of S-adenosylmethionine, which contribute their methyl groups.

reticulocalbin a Ca^{2+} -binding luminal protein of the endoplasmic reticulum. It has six **EF-hands**, a 20-residue N-terminal **signal sequence**, and the C-terminal sequence **HDEL**.

reticulocyte an immature **erythrocyte** that can synthesize protein, $\approx 90\%$ being hemoglobin. It retains intracellular organelles, including mitochondria, and histologically stains for the presence of ribosomes. The name derives from the reticulate appearance of the stained cells.

reticulocyte lysate the preparation obtained by suspending **reticulocytes** in distilled water so that the cells are lysed by osmotic shock.

The reticulocytes are usually obtained from rabbits in which **reticulocytosis** has been induced by the administration of phenylhydrazine. The residual RNA is usually removed by the addition of a ribonuclease that is calcium-dependent and is thereby inactivated by the addition of EDTA. Such a lysate is often used for the *in vitro* translation of added mRNA.

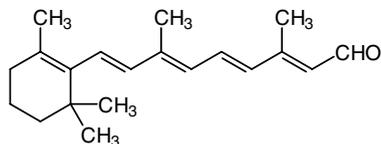

reticulocytosis enhanced levels of reticulocytes in the blood, often due to experimentally-induced increased production. *See also* **reticulocyte lysate**.

reticuloendothelial system a former name for **mononuclear phagocyte system**.

reticulum **1** the **endoplasmic reticulum**, a netlike structure of membranes found in the cytoplasm. **2** the most anterior chamber of the ruminant stomach.

retina the light-sensitive layer lining the inside of the posterior wall of the eye in vertebrates and some classes of molluscs. The inner nervous layer of the vertebrate retina is transparent and contains photoreceptive **cone cells** and/or **rod cells** together with their associated nerve cells and fibres, glia, and blood vessels; the outer layer, next to the choroid, is darkly pigmented and prevents back-reflection of light.

retinal **1** pertaining to the retina. **2** the recommended trivial name for (2*E*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraen-1-yl; *other names*: retinal₁; retinaldehyde; vitamin A aldehyde; retinene. A compound that plays an important role in the visual process in most vertebrates (*compare* **3,4-didehydroretinal**). In the retina this (all-*E*)-isomer, all-*trans*-retinal, is converted by **retinal isomerase** to its (2*E*,4*Z*,6*E*,8*E*)-stereoisomer, 11-*cis*-retinal, which then combines (as a Schiff's base) with an opsin to form (in cone cells) **iodopsin**, **porphyropsin**, or **cyanopsin**, or (in rod cells) **rhodopsin**. Interaction with a photon brings about dissociation of the retinal from the opsin to produce all-*trans*-retinal, thereby completing the visual cycle. Retinal is formed in the retina by enzymic oxidation of **retinol**; in addition, most vertebrates can convert dietary α -, β -, and γ -carotenes to retinal by oxidative cleavage of the polyprenyl chain at its midpoint. [*Note*: (1) The numbering system of the systematic name is different from that of the trivial name, the latter following the rules used for carotenoids. (2) The fuller name **retinaldehyde** is recommended if confusion with def. 1 may occur.]

all-*trans*-retinal

retinal₁ (*sometimes*) an alternative name for **retinal** (def. 2) (especially to distinguish it from **retinal**₂; not recommended).

retinal₂ (*sometimes*) an alternative name for **3,4-didehydroretinal** (especially to distinguish it from **retinal**₁; not recommended).

retinal cone *see* **cone cell**.

retinaldehyde *see* **retinal**.

retinal isomerase EC 5.2.1.3; *systematic name*: all-*trans*-retinal 11-*cis*-*trans*-isomerase; *other name*: retinene isomerase; an enzyme that catalyses the conversion of all-*trans*-retinal to 11-*cis*-retinal. *See also* **retinal** (def. 2).

retinal rod *see* **rod cell**.

retinene or **retinene**₁ an alternative name for **retinal** (def. 2) (not recommended).

retinene₂ an alternative name for **3,4-didehydroretinal** (not recommended).

retinene isomerase an alternative name for **retinal isomerase**.

retinitis pigmentosa a relatively common genetic disorder which in humans affects 1 in 4000 people and is caused by the premature death of photoreceptors. The result is progressive night blindness, contraction of the visual field and finally complete loss of sight.

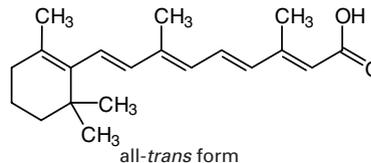

One form of autosomal dominant disease results from an abnormality on chromosome 3. In this, there is a single amino-acid substitution in the **rhodopsin** molecule caused by a base transversion of C to A, which results in the change of a proline to a histidine residue at position 23 in the **opsin** molecule, causing the characteristic retinal degeneration. Another severe form of the disease, affecting up to around 20% of some populations, is X-linked; it usually becomes manifest within the first two decades of life and progresses to blindness within 10–20 years. The gene, named **RPGR**, for this form has now been found on the short arm of the X-chromosome. The predicted 90 kDa protein product of the **RPGR** gene bears significant homology to the **RCC1 family**.

retinoate **1** the anion of **retinoic acid**. **2** any salt or ester of retinoic acid.

retinoblastoma a childhood cancer of the developing retina. The offspring of surviving victims have a high incidence of this disease as well as several other types of malignancies. Retinoblastoma is associated with the inheritance of a copy of chromosome-13 from which a particular segment has been deleted. It develops through a mutation in a retinoblast (a retinal precursor cell). The affected chromosomal segment contains the **RB** gene which specifies a factor that restrains uninhibited cell proliferation. Thus the **RB** gene is a **tumour suppressor gene**. *See also* **retinoblastoma protein**.

retinoblastoma protein *abbr.*: pRb; the product of the retinoblastoma gene, **RB**. pRb is a 105 kDa DNA-binding protein that is localized in the nucleus of normal retinal cells, but absent in **retinoblastoma** cells. The protein is phosphorylated in the cell cycle by protein kinase **CDC2**. It appears that the interaction of pRb with various **transcription factors** suppresses cellular proliferation.

retinoic acid the recommended trivial name for (2*E*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraenoic acid; *other names*: **tretinoin**; vitamin A acid; it is formed from **retinal** by enzymic oxidation in kidney and other tissues, and is active in preventing some of the symptoms of vitamin A deficiency. It is a morphogen and regulator of differentiation during embryogenesis. *See* **retinoic acid receptor**, **vitamin A**.

all-*trans* form

retinoic acid orphan receptor an alternative name for **retinoid receptor**.

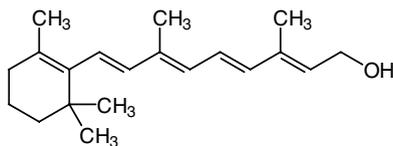

retinoic acid receptor a nuclear receptor for **retinoic acid** that mediates its effects on cells. These receptors bind retinoic acid and directly regulate gene expression. The proteins belong to the steroid/thyroid/retinoic acid family of nuclear receptors for hormones. The ligand-binding domain is in the C-terminal region, the zinc-finger DNA-binding domain in a central region, and a function-modulating domain in the N-terminal region. Binding of hormone induces changes in receptor conformation that control transcriptional activation and repression, and also regulates homo- or heterodimerization. In the absence of ligand, these receptors repress basal gene expression, probably through co-repressor proteins. α , β , γ and δ types of receptor are known.

retinoid any isoprenoid, whether naturally occurring or not, that contains or is derived from four prenyl groups linked in a head-to-tail manner. All retinoids may formally be derived from a monocyclic parent compound with 20 carbon atoms containing five carbon-carbon double bonds and a functional group at the terminus of its acyclic moiety.

retinoid receptor (*abbr.*: RXR) or **retinoic acid orphan receptor** a nuclear receptor that binds more tightly to other retinoids than to retinoic acid. Three isoforms (α , β , and γ) are known. Phytanic acid binds to all three. Retinoid receptors form heterodimers with **RAR** or with **PPARs**, and are widely distributed in brain and spinal cord.

retinol the recommended trivial name for (2*E*,4*E*,6*E*,8*E*)-3,7-di-

methyl-9-(2,6,6-trimethylcyclohex-1-en-1-yl)nona-2,4,6,8-tetraen-1-ol; *other names*: vitamin A; vitamin A alcohol; axerophthol. The predominant form of **vitamin A** in higher vertebrates and marine fishes (*compare* **3,4-didehydroretinol**). It is stored primarily in the liver, mostly as the ester, retinyl palmitate.

all-trans form

retinol-binding protein a protein, secreted by liver, that binds retinol and as a homodimer forms a complex with transthyretin in plasma. The crystal structure shows eight antiparallel beta strands, which form a retinol-binding pocket.

retinoyl the acyl group formally derived from **retinoic acid**.

retinyl the alkyl group formally derived from **retinol** by loss of its hydroxyl group.

retro+ prefix signifying backwards, or in the reverse direction.

retroendocytosis the process by which some particles, e.g. low-density lipoproteins, are released, after receptor-binding and endocytosis, back into the medium rather than being degraded within lysosomes.

retrogene a segment of DNA that has arisen by reverse transcription of the genetic material in an RNA virus (**retrovirus**) and incorporation of the DNA so formed into the host cell's genomic DNA.

retrogradation the spontaneous irreversible change of a liquid colloidal solution to an insoluble or gelled state. The term is used especially of aqueous amylose solutions in which microcrystalline precipitates of aligned, hydrogen-bonded amylose molecules occur on standing.

retrograde 1 moving backwards; reverse or inverse; tending towards a former state or condition; deteriorating. **2** to move backwards or in reverse, as in retrograde transport.

retrogress to move backwards or in a less favourable direction; to deteriorate or degenerate. —**retrogression** *n.*; **retrogressive** *adj.*

retroinhibition *an alternative name for feedback inhibition.*

retropepsin EC 3.4.23.16; a **pepsin**-type endopeptidase from **HIV** that catalyses the hydrolysis of Xaa-|Xbb bonds, where Xaa is a hydrophobic residue, and Xbb is variable, but often is Pro. It is part of the polyprotein product of the **pol** gene.

retroposon or **retrotransposon** a **transposable element** that uses a mechanism indistinguishable from part of a retroviral life cycle. Retroposons are present in many organisms, such as yeast, *Drosophila*, and mammals. A good example is the Ty1 element of yeast: after the formation of a double-stranded DNA by **reverse transcriptase** it is integrated into a random site on the chromosome.

retroregulation the regulation of translation of messenger RNA (mRNA) by a sequence that is downstream of the region undergoing translation. For example, an mRNA of phage lambda carrying the sequence of gene *int* is not normally translated; mutation in a site called *sib*, located downstream of the *int* coding sequence, allows translation of the *int* mRNA.

retrotransposon *an alternative name for retroposon.*

Retrovir *see* **zidovudine**.

retroviral oncogene *see* **oncogene**, **retrovirus**.

retrovirus or **ribodeoxyvirus** or **RNA-DNA virus** any virus belonging to the family Retroviridae. This comprises single-stranded RNA animal viruses whose genome is diploid, consisting of two copies of the RNA, which is transcribed by the virion-associated enzyme **reverse transcriptase** into DNA. This double-stranded DNA, or **provirus**, can then integrate into the host genome and be passed from parent cell to progeny cell as a component of the host genome. The virion is an enveloped, roundish particle, ≈100 nm in diameter, with a helical nucleocapsid containing 6 MDa of RNA (in two iden-

tical molecules) joined to their 5' ends and hydrogen-bonded into loops (70S RNA), plus small (45S) RNA from the host. The genome is flanked by long terminal repeat sequences and comprises at least three genes: *gag*, which encodes the inner capsid protein; *pol*, which codes for a polyprotein containing **retropepsin**, ribonuclease H (*see* **ribonuclease**), and **reverse transcriptase**; and *env*, which codes for the spikes on the envelope. A subfamily of retroviruses, known as the Oncovirinae (or the RNA tumour viruses), contain an additional **oncogene**, which confers the ability to form tumours in the host. These oncoviruses include the Rous sarcoma virus and other leukosis viruses of birds, and viruses causing leukemia in various mammals (not in humans). They have also been called **oncornaviruses**, **rousviruses**, and **leukoviruses**. Other subfamilies include the Spumavirinae (spumaviruses) and the Lentivirinae (lentiviruses); **HIV** is a member of the latter. The retroviruses are in class VI of the **Baltimore classification**.

Rett syndrome *see* **methylCpG-binding protein 2**.

reversal an evolutionary change that results in a derived character state reverting to its ancestral state.

reverse cholesterol transport the efflux of cholesterol (usually paralleled by efflux of phospholipid) from cells. It occurs, via a specific ABC transporter (which is defective in Tangier disease), onto high-density lipoprotein (HDL) particles bound to the cell surface. The cholesterol is eventually delivered to the liver. The process accounts for the antiatherogenic properties of HDL.

reverse dialysis a technique for the concentration of macromolecules in solution. The (dilute) solution is placed in a bag made of a semipermeable material, through which the macromolecules cannot pass but water and other small molecules can. The bag is placed in a bed of dry water-soluble polymer (which cannot enter the membrane) such as polyethylene glycol. Water, together with other small molecules, is then drawn out of the bag into the external phase until equilibrium is reached, thereby concentrating the solution of macromolecules in the bag. *Compare* **dialysis**.

reversed phase or **reverse phase** a system used in **adsorption chromatography** (often thin-layer or high-pressure liquid chromatography), in which the **stationary phase** consists of a material with a hydrophobic surface. In such a system, molecules migrate in order of polarity, the most polar migrating fastest. In column chromatography, mobile phases are used in a sequence commencing with more polar solvents and proceeding in decreasing order of polarity, the reverse of the sequence used in normal phase chromatography. The stationary phase often consists of silicic acid in which all hydrophilic groups are masked by silanization.

reversed rocket immunoelectrophoresis a variant of **rocket immunoelectrophoresis** in which antibodies are forced by electrophoresis through antigen-containing agarose gel, the heights of the 'rockets' so formed being related to the antibody concentrations. It is useful for titre determinations in large series of antibody samples.

reverse genetics *another name for positional cloning*. A term coined to describe the study of the biological consequences to an organism of artificial alteration of its DNA. The changes may be either gross (e.g. deletion, insertion, or transposition of segments of DNA effected by recombinant DNA technology) or limited to specific loci (e.g. base substitution through site-directed mutagenesis).

reverse gyrase an ATPase enzyme with a **DNA helicase**-like domain and a type-I (**DNA**) **topoisomerase** in the same protein. It is able to induce positive supercoiling into DNA, a property of DNA that is found only in bacteria that express this enzyme.

reverse mutation or **back mutation** a heritable change in a mutant gene that restores a nucleotide sequence to that which obtained prior to mutation. *Compare* **reversion**.

reverse osmosis the pressure-induced flow of solvent through a semipermeable membrane in a direction that enhances any existing difference in the activities (or concentrations) of the nonpermeant solutes on the two sides of the membrane (*compare* **osmosis**). The principle can be used in the preparation of purified water from tap water or sea water.

reverse phase *see* **reversed phase**.

reverse pinocytosis *see* **exocytosis**.

reverse transcriptase EC 2.7.7.49; *recommended name*: RNA-directed DNA polymerase; *systematic name*: deoxynucleoside-

triphosphate:DNA deoxynucleotidyltransferase (RNA-directed); *other names*: DNA nucleotidyltransferase (RNA-directed); reverse transcriptase. A DNA polymerase enzyme, found particularly in retroviruses and possibly in normal animal cells, that uses either DNA or RNA as a template. It catalyses a reaction between a deoxynucleoside triphosphate and DNA_n to form pyrophosphate and DNA_{n+1}; this protein also has ribonuclease H (RNase H) activity. When the single-stranded RNA of the retrovirus enters a cell, the enzyme first makes a DNA copy of one of the **long terminal repeats** of the viral genomic RNA strand using a tRNA as a primer. The stretch of RNA used as a template is then digested by the RNase H activity of the enzyme, releasing the newly synthesized stretch of DNA, which then pairs with a complementary stretch of viral RNA to form a DNA–RNA hybrid. This heteroduplex is then used by the same enzyme to make a double-stranded DNA, which circularizes and integrates into a host cell chromosome. Reverse transcriptase lacks a proofreading exonuclease function and is highly error prone. It can thus evolve even within a single patient, and this interferes with long-term therapy. Reverse transcriptase is used *in vitro* to make cDNA from mRNA in a reaction requiring deoxynucleoside triphosphates (dNTPs) and a primer such as **oligo dT**(12–18). Enzymes from avian myeloblastosis virus (AMV) and Moloney murine leukemia virus (MMLV) are suitable for this purpose. **Telomerase** is a template-bearing reverse transcriptase.

reverse transcription the process carried out by **reverse transcriptase**. *See also* **transcription**.

reverse turn (*in protein structure*) a structural feature that allows the polypeptide chain to turn back through about 180°. *See also* **beta bend**.

reversible competitive antagonist (*in pharmacology*) an antagonist for which the rate of dissociation from its receptor is relatively high, such that by increasing the concentration of an agonist the receptor **occupancy** (def. 2) of the antagonist falls. At sufficiently high concentrations of agonist a maximal tissue response can be obtained, even in the presence of the antagonist, such that the extent of antagonism is determined by the relative concentrations of agonist and antagonist.

reversible inhibition (of an enzyme or other system) a type of inhibition that occurs when the equilibrium between free inhibitor and the inhibitor–enzyme (or system) complex lies sufficiently far towards the free inhibitor state for the inhibitor to be readily removed, leaving an active enzyme (or system).

reversible reaction a reaction in which the **equilibrium constant** is such that the reaction can be made to proceed at a detectable rate in either direction under appropriate conditions.

reversion the restoration, by a second mutation, of the genomic base sequence of a mutant virus or organism to that of the parental strain. Less strictly, any return to the original **phenotype**. *See also* **back mutation**, **reverse mutation**.

reversion frequency the proportion of the total number of cells in a population that undergo **reversion**.

reversion spectroscopy a **spectroscope** in which two spectra alongside each other, one of which is reversed by optical means, are formed by the entering light. The two spectra may be moved longitudinally relative to each other by moving a micrometer screw. If two absorption bands are aligned when a particular substance, e.g. oxyhemoglobin, is viewed, the amount by which the screw has to be turned to align the same band when a mixture of the same substance and another with a similar absorption spectrum, e.g. carbon-monooxyhemoglobin, is viewed is related to the proportion of the second substance present.

revertant 1 a mutant that has partially or completely regained the wild-type phenotype. **2** a gene that has undergone **reversion**.

revertase an *alternative name for reverse transcriptase*.

rexinoid a synthetic agonist of **retinoid X receptors**.

Reye syndrome an acute noninflammatory encephalopathy in children that is associated with fatty degeneration of the liver and hyperammonemia. Many cases are caused by inborn errors of fatty acid oxidation. There is strong epidemiological evidence for an association with salicylate ingestion and influenza B virus infection. [After R.D.K. Reye (1912–77), Australian pathologist.]

Reynolds number *symbol*: *Re*; a nondimensional parameter of fluid motion through a cylindrical tube or past an obstruction. It is given by the expression vl/ν , where *l* has the dimensions of length, *v* is the fluid's velocity, and ν is the kinematic viscosity. In general, low Reynolds numbers show that viscous forces predominate in controlling the flow, while high Reynolds numbers indicate that inertial forces are more important. [After Osborne Reynolds (1842–1912), Irish physicist and engineer.]

RF *abbr. for 1* release factor. **2** replicative form.

R factor 1 *abbr. for* resistance factor (*see resistance plasmid*). **2** (*formerly*) *abbr. for* release factor.

RFC *abbr. for* reduced folate carrier.

rfDNA *see* **DNA**.

RFLP *abbr. for* restriction fragment length polymorphism.

R form 1 *abbr. for* relaxed form (of a protein). **2 R-form** (hyphenated) *abbr. for* rough form; describing bacterial colonies with a jagged perimeter.

RFX *abbr. for* regulatory factor for X box; a DNA-binding heterotrimeric protein complex that binds the X box (a nucleotide sequence within the 150 bp response element) of the promoters of MHC class II genes. The three subunits are RFX5 (75 kDa), RFXAP (36 kDa), and **RFXANK**, and the protein forms higher-order complexes with proteins that bind other regions within the response element. Mutations in any component of the RFX complex cause MHC class II deficiency in humans.

RFXANK a 33 kDa protein component of the **RFX** complex. It contains three ankyrin repeats and is required for efficient DNA-binding and transcriptional activation of MHC class II gene promoters by the RFX complex.

RGD the tripeptide Arg–Gly–Asp, which is present in **fibronectin** and some other extracellular matrix proteins and is recognized by some **integrins**.

R gene *abbr. for* resistance gene; any gene in plants that imparts resistance against viruses, bacteria, fungi, aphids, or nematodes. Examples are known in potato, tobacco, flax, tomato, maize, barley, and sugar beet, among others. Many of the proteins (**R proteins**) they encode contain leucine-rich repeats, which mediate protein–protein interactions. Some also contain leucine zipper, coiled-coil, or other sequences. Many R proteins are cytoplasmic, and some are transmembrane.

RGG box a peptide sequence (20–25 amino acids) present in some proteins, often in association with the RNA-binding domains found in FMR1. It contains repeats of Arg–Gly–Gly, often interspersed with aromatic residues.

RGK-2 *see* **tonin**.

RGS protein *abbr. for* regulator of G-protein signalling protein; any protein containing a conserved sequence (≈120 amino acids) that binds the α subunit of a trimeric **G-protein** and enhances its GTPase activity; i.e. they are GTPase-activating proteins (GAPs). There are over 25 in mammals. They frequently contain other homology domains that increase the range of proteins that they bind. RGS-PX1 regulates G_{Sα}, RGS7 putatively binds the C-terminal region of polycystin-1, RGS9 regulates G_{Tα} (**transducin**), and RGS12 regulates G_{Oα}.

rH the negative logarithm of the concentration (expressed as pressure in atmospheres) of hydrogen gas in equilibrium with a redox system; i.e.

$$rH = -\log[H_2].$$

Also,

$$rH = 2(E_h F)/(RT \ln 10) + pH,$$

where *F* is the Faraday constant, *R* the gas constant, *T* the thermodynamic temperature, and *E_h* the **redox potential** at the pH of the system under study.

Rh 1 *abbr. for* Rhesus factor. **2** *symbol for* rhodium.

Rha *symbol for* rhamnose.

Rhabdoviridae a family of single-stranded RNA viruses infecting vertebrates, arthropods, amoebae, and plants. The virions are 70–80 nm elongated particles, with a lipid envelope. They contain negative-strand RNA together with RNA-dependent RNA polymerase, which transcribes the genome directly to mRNA – they are

class IV viruses in the **Baltimore classification**. Rhabdoviruses are usually transmitted by arthropods; they include the plant rhabdoviruses, the vesiculoviruses (e.g. the vesicular stomatitis virus of cattle), the lyssaviruses, which include the rabies virus, and sigma virus of *Drosophila*. [From Greek *rhabdos*, rod.]

rhabdovirus *see* **Rhabdoviridae**.

L-rhamnosamine 2-amino-2,6-dideoxy-L-mannose; an amino sugar that occurs in some bacterial lipopolysaccharides.

rhamnose *symbol*: Rha; 6-deoxy-L-mannose; a monosaccharide (hexose) that occurs commonly in plant glycosides, in polysaccharides of gums and mucilages, and in bacterial polysaccharides; it also occurs in some plant cell-wall polysaccharides, and in flavonoids. Free rhamnose is found in some plants. The D-enantiomer occurs in some bacterial capsular polysaccharides. *See also* **L-rhamnose isomerase**.

L-rhamnose isomerase EC 5.3.1.14; *systematic name*: L-rhamnose ketol-isomerase; an enzyme that catalyses the interconversion of L-rhamnose and L-rhamnulose. It initiates the catabolism of rhamnose.

rhamnulose 6-deoxyfructose; it is formed by **L-rhamnose isomerase**.

rheology the science concerning the deformation and flow of matter. —**rheological** *adj.*

rheosome or **flow signal** a chemical messenger or transmitter substance (other than a neurotransmitter) carried from a site of generation to site of action within a cell (e.g. a neuron) by cytoplasmic flow; a translocated **bioseme** or **second messenger**.

rheostat a device in which a controllable resistance is introduced into an electrical circuit to vary the output to permit an apparatus to be regulated within desired limits.

Rhesus factor *abbr.*: Rh; a protein associated with the rhesus (Rh) system of blood groups in humans. The system was so designated as a result of the finding that rabbit and guinea-pig antibodies raised against erythrocytes from *Macacus rhesus* monkeys agglutinated erythrocytes from 85% of the random human population. Initially, an antigen, designated D, was isolated from the erythrocytes of Rh-positive individuals; those lacking D were classified Rh-negative. Subsequently, another antigen, LW (Landsteiner-Weiner), was identified, which, although phenotypically similar to D, is encoded by a gene that segregates independently from Rh. C and E antigens have also been found. The antigenic determinant is associated with the protein structure. In hemolytic disease of the newborn resulting from rhesus incompatibility, antibodies from a Rh-negative mother, often formed during the birth of a previous Rh-positive child whose blood has entered the mother's bloodstream, pass across the placenta and cause destruction of fetal red cells.

rheumatoid factors autoantibodies to the IgG Fc region, also known as antiglobulins, that are the hallmark of patients with rheumatoid arthritis.

rhinovirus any small RNA virus belonging to the Picornaviridae family, members of which are responsible for the common cold in humans, and foot-and-mouth disease in cattle.

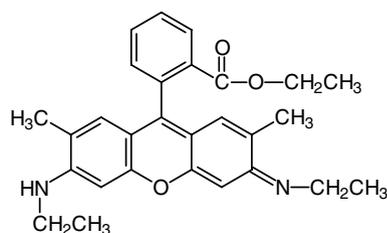

Rhizobium a genus of soil bacteria whose members reside symbiotically in specialized root nodules of leguminous plants. The bacteria are active in **nitrogen fixation** providing the plant with organic nitrogen and obtaining carbon compounds in return. Many *Rhizobium* species contain plasmids that enable them to colonize their host plant species.

rhizomorph a stout, rootlike mass of hyphae, produced by some fungi, that serves to generate vegetative spread.

RH map *abbr.* for radiation hybrid map.

rho *symbol*: ρ (lower case) or P (upper case); the seventeenth letter of the Greek alphabet. For uses *see* **Appendix A**. *See also* **rho protein**, **Rho protein**.

Rhodamine any of a series of dyes based on 9-(2-carboxyphenyl)xanthine. Rhodamine 6G, *N*-[9-(2-carboxyethylphenyl)-6-(diethylamino)-3*H*-xanthen-3-ylidene]ethylethanamine, is used as a spray to reveal lipids as pink fluorescent spots after thin-layer chromatography, and as the isothiocyanate derivative as a label for proteins and nucleotides. Rhodamine 6G has λ_{max} excitation 525 nm and emission 555 nm.

Rhodamine 6G

rhodanese EC 2.8.1.1; *recommended name*: thiosulfate sulfur-transferase; *systematic name*: thiosulfate:cyanoide sulfur-transferase; *other names*: thiosulfate cyanide transsulfurase; thiosulfate thio-transferase. An enzyme that catalyses the displacement of sulfite from thiosulfate by cyanide ion, forming sulfite and thiocyanate and thus detoxifying cyanide. It has two domains of closely similar conformation yet very different sequence. [From the use of rhodanate as a name for thiocyanate.]

rhodanid any **thiocyanate** produced by the metabolism of mustard-oil glycosides (glycosinolates) in damaged leaf tissues.

rhodium *symbol*: Rh; a silvery-white metallic transition element of group VIII of the (IUPAC) **periodic table**; atomic number 45; relative atomic mass 102.9. It occurs mainly in oxidation state III. A rare member of the platinum metals, it is resistant to nitric acid and aqua regia.

rhodniin a thrombin inhibitor found in the saliva of the blood-sucking reduviid bug *Rhodnius prolixus*.

rhodo+ or (before a vowel) **rhod+** *comb. form* indicating a red colour, or the odour of a rose. [From Greek *rhodos*, rose.]

rhodopsin or **visual purple** a brilliant purplish-red, light-sensitive visual pigment found in the rod cells of the retinas of most vertebrates (exceptions being freshwater and migratory fish, and some amphibians). It is a **7TM protein** similar to other members of the G protein-coupled receptor family. It consists of a rod-type **opsin** combined (as a Schiff's base) with 11-*cis*-retinal (*see* **retinal**). It has an absorption maximum at ~500 nm. *Compare* **porphyropsin**. A single amino-acid substitution in the rhodopsin molecule causes one form of **retinitis pigmentosa** in humans. *See also* **bacteriorhodopsin**, **halorhodopsin**, **slow-cycling rhodopsin**.

rho factor *an alternative name for rho protein*.

RhoGEF *abbr.* for Rho guanine nucleotide exchange factor; a protein that enhances the exchange of GDP for GTP in a **Rho protein** and contains a GEF domain (~200 amino acids) followed by a pleckstrin homology domain. **FGD1 protein** is a RhoGEF for Cdc42.

RhoGTPase any of a subfamily of Ras-related GTPases that are involved in the assembly of actin microfilaments into stress fibres and in formation of the contractile ring during cell division. They have crucial roles in metazoan development because they regulate cell shape, adhesion, and migration. There are at least ten mammalian RhoGTPases (RhoA to RhoE; Rac1, Rac2, and RacE; Cdc42 and TC10), which share ~50% homology and become prenylated at the C-terminal CAAX motif. They cycle between (active) RhoGTP and (inactive) RhoGDP forms, the relative proportions being regulated by **Rho guanine nucleotide-exchange factors** (RhoGEFs).

Rho guanine nucleotide exchange factor *see* **RhoGEF**.

rho protein or (sometimes) **rho factor** a bacterial ATP-dependent helicase that facilitates transcription termination. Binding of rho to the nascent RNA is followed by activation of rho's RNA-dependent ATPase activity, and release of the mRNA from the DNA template; it recognizes and binds to C-rich regions of the RNA transcript. In *Escherichia coli*, this protein is the site of action of the antibiotic bicyclomycin, which binds to rho protein and inhibits its ATPase activity. *Compare* **Rho protein**.

Rho protein a small Ras-related GTPase (*see* **RAS**), involved in controlling the polymerization of actin into filaments, and subsequent organization. *RHOB* is an early response gene transiently induced in fibroblasts by platelet-derived growth factor, or epidermal

growth factor; its over-expression can be tumorigenic. *Compare rho protein.*

RI *abbr.* for 1 refractive index. **2** ribonuclease inhibitor.

RIA *abbr.* for radioimmunoassay.

Rib *symbol* for ribose.

ribaric acid one of the **pentaric acids**. *See also aldaric acid.*

ribavarin A guanosine nucleotide analogue, 1- β -D-ribofuranosyl-1,2,4-triazole-3-carboxamide. Mainly used against syncytial virus in young children but also effective with α -interferon against **hepatitis C**. It is probable that the antiviral action is due to the monophosphate derivative competitively inhibiting inosine-5'-monophosphate dehydrogenase.

ribitol or **adonitol** a **pentitol** derived formally by reduction of the -CHO group of D- or L-ribose. It is a *meso* compound and does not require a D or L configurational descriptor. It occurs free in some plants and is a component of **riboflavin**.

ribitol teichoic acid a complex polymer of **ribitol** residues linked by phosphate groups, substituted by glucosyl or acetylglucosamine residues and ester-linked to D-alanine. It is found in the walls of Gram-positive bacteria.

ribo+ *comb. form* **1** of, relating to, or containing **ribose**, especially as opposed to deoxyribose. **2** containing a ribose residue linked through its anomeric carbon. It is used in **riboflavin**, inappropriately, for a ribitol residue.

ribo- *prefix (in chemical nomenclature)* indicating a particular configuration of three contiguous >CHOH groups (as found in the acyclic form of D- or L-ribose). *See also monosaccharide.*

ribocharin an acidic protein specifically associated with the granular component of the nucleolus and nucleoplasmic 65S particles. These particles contain the nuclear 28S rRNA, and may represent the precursor to the large ribosomal subunit.

ribodeoxyvirus any RNA virus that replicates via DNA; such viruses are usually known as **retroviruses**. *Compare deoxyribovirus.*

riboflavin *an alternative name for vitamin B₂.*

ribofuranosyl *an alternative term for ribosyl.*

ribonuclease *abbr.:* RNase or (*sometimes*) RNAase; any of a group of nuclease enzymes that cleave phosphodiester bonds in RNA. With the exception of RNase P, which is a **ribozyme**, they are all proteins. RNAases are classified into **exoribonucleases**, catalysing sequential cleavage of mononucleotides from either a free 5' or 3' terminus, or both, or **endonucleases**, cleaving bonds within the polyribonucleotide chain. Endonucleases, which can also cleave circular molecules of RNA, fall into further categories according to their specificity: EC 3.1.13, exoribonucleases producing 5'-phosphomonoesters; EC 3.1.14, exoribonucleases producing other than 5'-phosphomonoesters; EC 3.1.15, exonucleases active with either ribo- or deoxyribonucleic acids and producing 5'-phosphomonoesters; EC 3.1.16, exonucleases active with either ribo- or deoxyribonucleic acids and producing other than 5'-phosphomonoesters; EC 3.1.26, endoribonucleases producing 5'-phosphomonoesters; EC 3.1.27, endoribonucleases producing other than 5'-phosphomonoesters; EC 3.1.30, endonucleases active with either ribo- or deoxyribonucleic acids and producing 5'-phosphomonoesters; and EC 3.1.31, endonucleases active with either ribo- or deoxyribonucleic acids and producing other than 5'-phosphomonoesters. Ribonucleases include enzymes having mechanisms of (A) phosphotransferases, (B) phosphodiesterases, or (C) phosphorylases. In group C are polynucleotide phosphorylase and polynucleotide pyrophosphorylase. The feature of group A is the involvement of the 2'-OH group in an intramolecular attack at the adjacent phosphodiester bond, in addition to conferring specificity for one or more of the four bases. The nucleoside 2':3'-cyclic phosphates are obligate intermediate products. In group B, a direct attack of water on the 3':5'-phosphodiester bond is catalysed, so that this group includes the enzymes that hydrolyse both RNA and DNA and those that cleave diester bridges to form only 5'-nucleotide products. Thus group A may be classed as cyclizing and group B as non-cyclizing enzymes. The group A enzymes do not depend for their activity on divalent cations whereas the group B enzymes require Mg²⁺ or Ca²⁺. Within each group there are many types, as described below.

Exoribonuclease II EC 3.1.13.1; *other name:* ribonuclease II; reaction: exonucleolytic cleavage in the 3'- to 5'-direction to yield 5'-

phosphomononucleotides. **Exoribonuclease H** EC 3.1.13.2; reaction: exonucleolytic cleavage to 5'-phosphomonoester oligonucleotides in both 5'- to 3'- and 3'- to 5'-directions. **Poly(A)-specific ribonuclease** EC 3.1.13.4; reaction: exonucleolytic cleavage of poly(A) to 5'-AMP. **Yeast ribonuclease** EC 3.1.14.1; reaction: exonucleolytic cleavage to 3'-phosphomononucleotides.

Endoribonucleases cleave the polynucleotide internally. This first group (sub-subclass EC 3.1.26) produce exclusively 5'-phosphomonoesters. *Physarum polycephalum* ribonuclease EC 3.1.26.1; reaction: endonucleolytic cleavage to 5'-phosphomonoester. **Ribonuclease alpha** EC 3.1.26.2; reaction: endonucleolytic cleavage to 5'-phosphomonoester. **ribonuclease III** EC 3.1.26.3; *other names:* RNase O; RNase D; reaction: endonucleolytic cleavage to 5'-phosphomonoester. **Ribonuclease H** EC 3.1.26.4; *other names:* endoribonuclease H (calf thymus); calf thymus ribonuclease H; reaction: endonucleolytic cleavage to 5'-phosphomonoester; it acts on RNA-DNA hybrids (hence the H in the name) and is required for removing RNA from **Okazaki fragments**; *see also RNA-directed DNA polymerase*. **Ribonuclease P** EC 3.1.26.5; reaction: endonucleolytic cleavage of RNA, removing 5'-sequence of extra nucleotides from tRNA precursor; it is a **ribozyme**; *see RNase P*. **Ribonuclease IV** EC 3.1.26.6; *other names:* endoribonuclease IV; poly(A)-specific ribonuclease; reaction: endonucleolytic cleavage of poly(A) to fragments terminated by 3'-hydroxyl and 5'-phosphate groups. **Ribonuclease P4** EC 3.1.26.7; reaction: endonucleolytic cleavage of RNA, removing 3'-sequence of extra nucleotides from tRNA precursor. **Ribonuclease M5** EC 3.1.26.8; *other name:* 5S rRNA maturation nuclease; reaction: endonucleolytic cleavage of RNA, removing 21 and 42 nucleotides, respectively, from the 5'- and 3'-termini of a 5S rRNA precursor. **Ribonuclease M16** cleaves the 5' and 3' termini of a 16S rRNA precursor. **Ribonuclease M23** cleaves the 5' and 3' termini of a 23S rRNA precursor. **Ribonuclease (poly(U)-specific)** EC 3.1.26.9; reaction: endonucleolytic cleavage of poly(U) to fragments terminated by 3'-hydroxyl and 5'-phosphate groups. **Ribonuclease IX** EC 3.1.26.10; reaction: endonucleolytic cleavage of poly(U) or poly(C) to fragments terminated by 3'-hydroxyl and 5'-phosphate groups (*see Rrp*).

The second group of endoribonucleases (sub-subclass EC 3.1.27) yield products other than 5'-phosphomonoesters. **Ribonuclease T2** EC 3.1.27.1; *other name:* ribonuclease II; reaction: two-stage endonucleolytic cleavage to 3'-phosphomononucleotides and 3'-phosphooligonucleotides with 2',3'-cyclic phosphate intermediates. *Bacillus subtilis* ribonuclease EC 3.1.27.2; reaction: endonucleolytic cleavage to 2',3'-cyclic nucleotides. **Ribonuclease T1** EC 3.1.27.3; *other names:* guanyloribonuclease; *Aspergillus oryzae* ribonuclease; ribonuclease N1; ribonuclease N2; reaction: two-stage endonucleolytic cleavage to 3'-phosphomononucleotides and 3'-phosphooligonucleotides ending in G-p with 2',3'-cyclic phosphate intermediates. **Ribonuclease U2** EC 3.1.27.4; reaction: two-stage endonucleolytic cleavage to 3'-phosphomononucleotides and 3'-phosphooligonucleotides ending in Ap or Gp with 2',3'-cyclic phosphate intermediates. **Pancreatic ribonuclease** EC 3.1.27.5; *other names:* ribonuclease; ribonuclease I; ribonuclease A; a notably thermostable enzyme that catalyses the reaction: endonucleolytic cleavage to 3'-phosphomononucleotides and 3'-phosphooligonucleotides ending in Cp or Up with 2',3'-cyclic phosphate intermediates. A glycosylated form, **ribonuclease B**, has the same specificity. *Enterobacter* ribonuclease EC 3.1.27.6; reaction: endonucleolytic cleavage to 3'-phosphomononucleotides and 3'-phosphooligonucleotides with 2',3'-cyclic phosphate intermediates. **Ribonuclease F** EC 3.1.27.7; reaction: endonucleolytic cleavage of RNA precursor into two, leaving 5'-hydroxyl and 3'-phosphate groups. **Ribonuclease V** EC 3.1.27.8; *other name:* endoribonuclease V; reaction: hydrolysis of poly(A), forming oligoribonucleotides and ultimately 3'-AMP. *Compare deoxyribo nuclease.*

ribonuclease inhibitor *abbr.:* RI; a porcine protein that inhibits pancreatic nuclease. It contains 17 leucine-rich repeats (each \approx 24 residues) that form hydrophobic beta strands. The crystal structure is available.

ribonuclease protection assay a method for measuring the abundance of a specific mRNA in which a short (~100 nucleotide) radioactively labelled antisense RNA probe is hybridized with a

population of RNA molecules. Treatment with ribonucleases A and T1 digests all single-stranded RNA leaving double-stranded RNA intact. Autoradiography or phosphorimaging of acrylamide electrophoresis gels, on which the digestion products are run, can provide quantitative information about mRNA abundance.

ribonucleate 1 *abbr.*: RNA; any anionic form of ribonucleic acid. **2** any salt of ribonucleic acid.

ribonucleic acid *abbr.*: RNA; pentose nucleic acid (*abbr.*: PNA); ribose nucleic acid; yeast nucleic acid. *See* RNA.

ribonucleoprotein *abbr.*: RNP; any conjugated protein that contains RNA as the non-protein moiety. Various specific kinds of RNP are listed with their abbreviations at RNP.

ribonucleoside any **nucleoside** (def. 1) in which the glycoside moiety is β -D-ribofuranose. The link is from C-1 of ribose to N-9 of a purine or to N-1 of a pyrimidine. To distinguish between the numbering systems of the base and sugar, the numbers of the sugar atoms are characterized by the addition of 'prime', i.e. 1' to 5'. The various products have trivial names, e.g. adenosine, guanosine, cytidine, and uridine. Strictly, the term ribonucleoside should be confined to structures occurring in nucleic acids, but it can be used for any base-ribose compound. By extension, it can be applied to **pseudouridine** (which occurs in tRNA) with a C-C link between ribose and uracil.

ribonucleoside-diphosphate reductase *the recommended name for nucleoside-diphosphate reductase.*

ribonucleoside-triphosphate reductase *the recommended name for nucleoside-triphosphate reductase.*

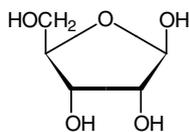

ribonucleotide any ribonucleoside in ester linkage to phosphate, commonly at the 5' position of the ribose moiety, although some 2'- and 3'-esters and some (cyclic) 2',3', or 3',5'-diesters are known. The 5'-ribonucleotides are metabolically important; they may be esters of [mono]phosphate, diphosphate, or triphosphate, e.g. guanosine 5'-[mono]phosphate, cytidine 5'-diphosphate, adenosine 5'-triphosphate. *See* nucleotide.

ribonucleotide reductase any enzyme that catalyses the reduction of ribonucleotides to deoxyribonucleotides during biosynthesis. *See* nucleoside-diphosphate reductase, nucleoside-triphosphate reductase.

ribophorin either of two type I single-pass transmembrane glycoproteins, ribophorins I and II, that form two subunits of *N*-oligosaccharyltransferase. They were first isolated bound to ribosomes on the rough endoplasmic reticulum. They form part of the ribosome receptor.

riboprobe any labelled RNA molecule used as a hybridization probe. Riboprobes are conveniently produced by *in vitro* transcription and are particularly useful for detecting specific mRNAs by hybridization *in situ*, and for ribonuclease protection assays.

ribose *symbol*: Rib; *ribo*-pentose. The D enantiomer, as β -D-ribofuranose, forms the glycoside moiety of all ribonucleosides, ribonucleotides, and ribonucleic acids, and of ribose phosphates, various glycosides, some coenzymes, and some forms of vitamin B₁₂.

β -D-ribofuranose

ribose nucleic acid *a former name for ribonucleic acid.*

ribose-5-phosphate epimerase EC 5.3.1.6; *systematic name*: D-ribose-5-phosphate ketol-isomerase; *other names*: phosphopentoisomerase; phosphoriboisomerase. An enzyme that catalyses the reaction:

It functions in pentose metabolism, especially the **pentose phosphate pathway**.

ribose-phosphate pyrophosphokinase EC 2.7.6.1; *other name*: phosphoribosyl pyrophosphate synthetase (*abbr.*: PRS); a con-

served enzyme that catalyses the formation of 5-phospho- α -D-ribose-1-diphosphate (*abbr.*: PRPP; *other name*: phosphoribosyl pyrophosphate) from ATP and D-ribose 5-phosphate with release of AMP; it is Mg²⁺-dependent. PRPP is an intermediate in the biosynthesis of histidine and tryptophan, and in the *de novo* biosynthesis of purines and pyrimidines.

riboside the product of the formation of a glycosidic bond between ribose and another group, either through the nitrogen of an amine or a hydroxyl group, i.e. via *N*- or *O*-glycosidic linkages. *See also* pseudouridine. *Compare* ribonucleoside.

ribosomal ambiguity *abbr.*: ram; the effect of any mutation (e.g. in ribosomal protein S4 or S5) in bacterial genomes that affects selection of aminoacyl-tRNA species during protein biosynthesis.

ribosomal DNA *abbr.*: rDNA; the genetic DNA coding for ribosomal RNA (*see* ribosome).

ribosomal protein *abbr.*: r-protein; any of the protein components of the ribosomal subunits. They are typically small, and some are basic. Ribosomal proteins are referred to as S (small subunit) proteins and L (large subunit) proteins; in *Escherichia coli*, there are 21 S proteins, designated S1–S21, and 34 L proteins, designated L1–L34. In eukaryotes (e.g., in rat liver), there are 33 S proteins and 49 L proteins. *See also* ribosome.

ribosomal protein S6 kinase *see* RSK.

ribosomal RNA *abbr.*: rRNA; *see* ribosome.

ribosomal RNA processing *see* Rrp.

ribosome an intracellular organelle, about 200 Å in diameter, consisting of RNA and protein. It is the site of protein biosynthesis resulting from translation of messenger RNA (mRNA). It consists of one large and one small subunit, each containing only protein and RNA. Ribosomes and their subunits are characterized by their sedimentation coefficients, expressed in **Svedberg units** (*symbol*: S). The prokaryotic ribosome (70S) comprises a large (50S) and a small (30S) subunit, while the eukaryotic ribosome (80S) comprises a large (60S) subunit and a small (40S) subunit. Several ribosomes may bind to one mRNA to form a **polysome**. Two sites on the large subunit are involved in translation, namely the **aminoacyl site** (A site) and **peptidyl site** (P site). Ribosomes from prokaryotes, eukaryotes, mitochondria, and chloroplasts have distinct **ribosomal proteins**. Prokaryotic ribosomes contain 35–45% protein, while eukaryotic ribosomes contain 50% protein. **Ribosomal RNA** (rRNA) is the RNA part of a ribosome. In prokaryotes, a 30S subunit contains one 16S RNA molecule with associated proteins, while a 50S subunit contains one 5S and one 23S RNA molecule. In eukaryotes, the 60S subunit contains one 28S, one 5.8S, and one 5S RNA molecule, while the 40S subunit contains one 18S RNA molecule. The structures are known. In *Escherichia coli*, the rRNAs form part of a large transcript containing transfer RNA (tRNA) molecules, which is then cleaved during processing. In eukaryotes, the genes for the 5.8S, 18S, and 28S molecules reside in the **nucleolus**, and code for a 40S transcript, which is then cleaved during processing; this includes splicing that occurs in the absence of protein. The gene for the 5S rRNA is a separate transcription unit outside the nucleolus. *See also* mRNA binding site, protein biosynthesis.

ribosome-inactivating protein *abbr.*: RIP; any of a group of proteins, obtained from plants, that inactivate eukaryotic ribosomes. They are of two types. Type I proteins include agrostin, dianthrin, dodecandrin, gelonin, luffin, nomordin, saporin-2, and tritin. They are enzymes, EC 3.2.2.22, that catalyse endohydrolysis of the *N*-glycosidic bond at one specific adenosine on 28S rRNA. They are plant protein toxins, and possibly have antiviral activity. Type II ribosome-inactivating proteins are enzymes with a similar action to the type I proteins, but have an additional covalently bound chain with lectin properties. They include **abrin**, **modeccin**, **ricin**, viscumin, and **volkensin**.

ribosome receptor the binding site on the endoplasmic reticulum (ER) membrane for ribosomes bearing nascent polypeptides destined for secretion or incorporation into ER, Golgi apparatus, or plasma membrane. It consists of several proteins (including the ribophorins) oriented with their C-terminal segments on the cytoplasmic ER surface. The proteins bind directly to the large ribosomal subunit, and may also function in translocation of the nascent polypeptide into the ER lumen.

ribosome recycling factor *abbr.*: RRF; *other name*: ribosome releasing factor; a factor required by bacteria for the recycling of ribosomes. It dissociates the termination complex after the polypeptide has been released from the peptidyl-tRNA by release factor.

riboswitch any part of an mRNA molecule (but usually in the 5' untranslated region) that can change its tertiary structure by interacting with some ligand and so inhibit translation.

ribosyl or **ribofuranosyl** any **glycosyl** group formally derivable from the α - or the β -furanose forms of D- or L-ribose. (The pyranose forms of ribose are exhibited only by the uncombined sugar.)

ribosylate to add a ribosyl residue. *Compare ADP-ribosylation.*

ribosylthymine *an alternative name for ribothymidine.*

ribosylthymine monophosphate *an alternative name for ribothymidine monophosphate.*

ribosylthymine phosphate *an alternative name for ribothymidine phosphate.*

ribothymidine or **ribosylthymine** *symbol*: T or Thd; 5-methyluridine; thymine riboside; 1- β -D-ribofuranosyl-5-methyluracil; a rare ribonucleoside, found as a minor component of many species of transfer RNA, where it is present as a residue of its 5'-phosphate. *See also ribothymidine 5'-phosphate. Compare thymidine.*

ribothymidine monophosphate or **ribosylthymine monophosphate** *abbr.*: TMP; *the common name for any ribothymidine phosphate, particularly for ribothymidine 5'-phosphate.*

ribothymidine phosphate or **ribosylthymine phosphate** ribothymidine monophosphate or ribosylthymine monophosphate (*abbr.*: TMP); any phosphoric monoester or diester of ribothymidine. Of the three possible monoesters – the 2'-phosphate, the 3'-phosphate, and the 5'-phosphate – and the two possible diesters – the 2',3'-phosphate and the 3',5'-phosphate – only **ribothymidine 5'-phosphate** is of any significance (the locant therefore being omitted if no ambiguity may arise).

ribothymidine 5'-phosphate or **ribosylthymine 5'-phosphate** or **5'-ribothymidylic acid** *symbol*: Thd5'P or pT; *the alternative recommended names for ribothymidine monophosphate or ribosylthymine monophosphate* (*abbr.*: TMP); 5'-ribothymidylyl phosphate; thymine riboside 5'-(dihydrogen diphosphate); thymine (mono)ribonucleotide. (The locant is commonly omitted if there is no ambiguity as to the position of phosphorylation.) A residue of ribothymidylic acid occurs in many species of transfer RNA, where it is formed *in situ* by methylation of the uracil moiety of an existing uridylic acid residue. This modification is effected by tRNA (uracil-5-)-methyltransferase (EC 2.1.1.35), the methyl group being derived from S-adenosyl-L-methionine.

ribothymidylylate 1 either the monoanion or the dianion of **ribothymidylic acid**. **2** any mixture of ribothymidylic acid and its anions. **3** any salt or ester of ribothymidylic acid.

ribothymidylic acid *the trivial name for any phosphoric monoester of ribothymidine.* The position of the phosphoric residue on the ribose moiety of a given ester may be specified by a prefixed locant – see **ribothymidine phosphate**. However, 5'-ribothymidylic acid is the ester commonly denoted, its locant usually being omitted if no ambiguity may arise. 5'-ribothymidylic acid is also an alternative recommended name for ribothymidine 5'-phosphate.

ribothymidylyl the ribothymidine[mono]phospho group; the acyl group derived from **ribothymidylic acid**.

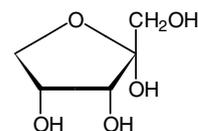

ribovirus *an alternative name for viroid.*

ribozyme an RNA molecule with catalytic activity. Such activity was first demonstrated in 1981 by Canadian-born US biochemist Sidney Altman (1939–) for RNase P. In 1982 the US biochemist Thomas R. Cech (1947–) discovered the catalysis by RNA of the reactions involved in the **splicing** of ribosomal RNA from *Tetrahymena*. In this process a 414-nucleotide intron is removed from a 6.4 kb precursor to yield the mature 26S rRNA. A guanine nucleotide is essential in the reaction, binding to the RNA and then attacking the 5' splice site to form a phosphodiester bond with the 5' end of the intron. The 414-nucleotide intron is then released and undergoes further splicing reactions to produce a linear RNA of 395 nucleotides which has lost 19 nucleotides and is named L19. L19 is catalytically active and acts both as a nuclease and a polymerase. The rate of conversion of a pentacytidylate into longer and shorter oligomers is about 10^{10} times the uncatalysed rate. Mg^{2+} plays an

essential role. Much smaller ribozymes have been demonstrated, e.g. the **viroids** which infect plants and undergo self-splicing after replication. Comparisons of nucleotide sequences in the vicinity of specific cleavage sites suggest that the active site has a **hammerhead** secondary structure consisting of three helical regions radiating from a central core of unpaired nucleotides. mRNA precursors in the mitochondria of yeast and fungi also undergo self-splicing as do some RNA precursors in chloroplasts. Such reactions can be classified according to the nature of the unit that attacks the upstream splice site. Group I are mediated by a guanosine cofactor. In group II the attacking moiety is the 2'-OH of a specific adenylate of the intron. Such reactions resemble those that occur in the **spliceosomes**. Ribozymes are especially interesting in respect of theories on the origin of life because of the popular idea that the first macromolecules were composed of RNA. *See also ribonuclease.*

(Rib5)ppA *symbol for adenosinediphosphoribose (alternative to AdoPPRib or A5'pp5Rib).*

D-ribulose *a nonsystematic name for the ketopentose D-erythro-2-pentulose.*

α -D-furanose form

D-ribulose 1,5-bisphosphate *abbr.*: RBP or RuBP; *former name*: ribulose diphosphate (*abbr.*: RDP or RuDP); a key metabolite of the **reductive pentose phosphate cycle**. It is formed in a reaction in which ribulose 5-phosphate is phosphorylated by ATP, catalysed by phosphoribulokinase, EC 2.7.1.19, and is a substrate of **ribulose-bisphosphate carboxylase**.

ribulose-bisphosphate carboxylase EC 4.1.1.39; *systematic name*: 3-phospho-D-glycerate carboxy-lyase (dimerizing); *other names*: ribulose-bisphosphate carboxylase/oxygenase (*abbr.*: Ru-bisco); the key enzyme in the fixation of CO_2 in the **reductive pentose phosphate cycle**; a copper protein. One molecule of D-ribulose 1,5-bisphosphate reacts with one molecule of CO_2 to yield two molecules of 3-phospho-D-glycerate, which can be converted into a hexose product (fructose 6-phosphate). If, as is possible, D-ribulose 1,5-bisphosphate reacts with O_2 instead of CO_2 , the products are one molecule each of 3-phospho-D-glycerate and 2-phosphoglycolate. This enzyme comprises up to 50% of leaf proteins and is the most abundant protein in the biosphere.

D-ribulose 5-phosphate the 5-phosphate ester of D-ribulose; it is a component of the **pentose phosphate pathway**, the product of 6-phosphogluconate dehydrogenase. It is converted to ribulose 1,5-bisphosphate in the **reductive pentose phosphate cycle** of photosynthesis.

L-ribulose-phosphate 4-epimerase EC 5.1.3.4; an enzyme that catalyses the reaction:

Richner-Ranhart syndrome *see tyrosine transaminase.*

ricin a highly toxic lectin obtained from the seeds of the castor oil plant, *Ricinus communis*. It is a 493 amino-acid glycoprotein dimer comprising an A chain (M_r 66000) and a B chain (M_r 34000) linked by a disulfide bond. Ricin binds to the cell via interaction between the B chain and galactose groups on cell-surface receptors; then the disulfide bond is cleaved allowing the A chain to enter the cell. The A chain then binds to the 60S ribosomal subunit and, acting as an N-glycosidase, causes depurination of a specific adenosine residue in the 28S rRNA that is essential for peptidyltransferase activity, thereby halting protein translation. *See also abrin, ribosome-inactivating protein.*

rickets or **rachitis** a disturbance of calcium (and phosphate) metabolism in young growing animals (including humans), resulting from a deficiency of **vitamin D** or of its activation. It is characterized by

softening of the bones and skeletal deformities, particularly bowing of the legs. — **rachitic** *adj.*

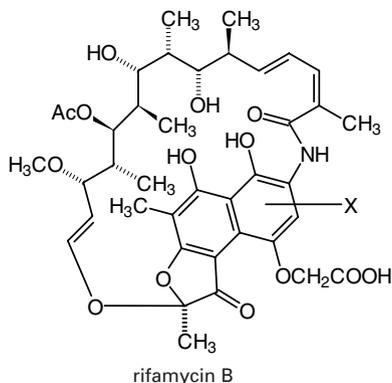

RID *abbr.* for radial immunodiffusion.

RIEP *abbr.* for rocket immunoelectrophoresis.

Rieske protein EC 1.10.99.1; *recommended name:* plastoquinol-plastocyanin oxidoreductase; *systematic name:* plastoquinol: oxidized-plastocyanin oxidoreductase; one of the four subunits of the cytochrome *b₆-f* complex. An enzyme that catalyses a reaction between plastoquinol-1 and two molecules of oxidized plastocyanin to form plastoquinone and two molecules of reduced plastocyanin. It is a high-potential 2Fe–2S protein. Apart from the Rieske protein, the subunits of the *b₆-f* complex consist of **cytochromes b₆** and **f**, and a 17 kDa peptide; it is similar to other iron–sulfur proteins (e.g., in mitochondria).

rifampicin or **rifampin** an antibiotic, *M_r* 823, obtained as a semisynthetic derivative of rifamycin B, differing only in the substituents on the ring marked X in the structure for that compound. It inhibits bacterial transcription in sensitive bacteria (see **rifamycin**) at extremely low concentrations (0.01 μg ml⁻¹) while having no effect on eukaryotic transcription at 10⁴ times that dose. Mitochondrial and chloroplast transcription may be affected at higher doses. It has application in molecular biology for removing plasmids from bacteria in a process known as **plasmid curing**.

rifamycin any anti-transcription antibiotic produced by *Streptomyces mediterranei* that is active against Gram-positive bacteria and *Mycobacterium tuberculosis* but much less effective against Gram-negative organisms. With the **streptovaricins** they are referred to as **ansamycins** – which contain a chromophoric naphthoquinone nucleus spanned by a long aliphatic bridge. They inhibit bacterial but not eukaryotic RNA synthesis via binding to the β subunit of bacterial DNA-dependent RNA polymerase and prevention of chain initiation; chain elongation is not affected once the initiation of RNA chain synthesis progresses beyond the third diester bond.

rigid (*in lipid biochemistry*) a term sometimes used to describe the ordered phase of a lipid bilayer below the phase transition temperature. See **phase transition (of lipids)**.

rimorphin a 13-residue peptide that is a major Leu-enkephalin-containing peptide in tissues that contain **dynorphin** and α -neo-dynorphin. It yields three **enkephalin** sequences.

rim protein *see* ABCR.

Rim protein an alternative name for ABC transporter retina. See **Stargardt macular dystrophy**.

ring chromosome an intrachromosomal rearrangement in which either the chromosome is circularized by joining of the telomere ends, or the ends of the p and q arms break off with subsequent formation of a ring and the consequent loss of genetic material. Ring chromosomes can behave in one of three ways at cell division, the outcome depending on the numbers of sister chromatid exchanges (SCE). An even number of SCEs in the same direction, or none, results in symmetrical segregation of chromatids. An even number of SCEs in different directions will lead to interlocked rings. An odd number of SCEs will lead to the formation of a continuous ring

from two parallel chromatids that is twice the size of the original rings.

ring closure the formation of a covalent bond that converts a linear molecule into a ring structure.

Ringer-Locke solution a less common name for **Locke's solution**.

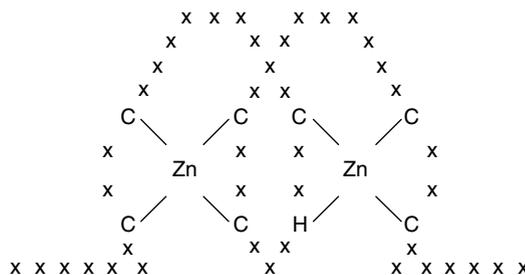

Ringer's solution or **Ringer solution** any of a number of aqueous solutions of mixed inorganic salts, of composition determined empirically by the British physician and physiologist Sydney Ringer (1835–1910), or adapted therefrom, that have been useful as fluid replacements *in vivo* or in place of serum as perfusing or suspending media for organs, tissues, or cells *in vitro*. Ringer's own mixtures (reported over the period 1882–87) were devised mostly for maintaining normal contractility of perfused isolated frog heart. One of the most effective solutions contained (in g L⁻¹, approx.) NaCl (7.0), KCl (0.04), CaCl₂ (anhydrous, 0.09), and NaHCO₃ (0.5). See also **Krebs' mammalian Ringer**, **Locke's solution**, **Tyrode's solution**.

Ringer-Tyrode solution a less common name for **Tyrode's solution**.

RING finger a zinc finger motif defined as

and present in a family of nuclear proteins. RING is an acronym for 'really interesting new gene'.

ring opening the breaking of a bond that converts a ring structure to an open-chain form.

RIP *abbr.* for 1 repeat-induced point (mutation); a phenomenon found in *Neurospora*; when more than one copy of a DNA sequence is present in a haploid genome that goes through a cross, both ectopic and endogenous copies are subject to point mutation at a high rate. RIP occurs in the dikaryotic ascogenous hyphae. Because transformation of *Neurospora* typically leads to gene amplification, RIP provides a highly efficient and selective method of introducing mutations *in vivo* in any gene cloned *in vitro*. **2** ribosome-inactivating protein. **3** Fas receptor interacting protein; a cytosolic protein kinase that contains a **death domain** and participates in the activation of NF-κB and in promoting apoptosis.

RISBASES proteins that share sequence similarity with members of the ribonuclease family, but are thought not to function as ribonucleases. Examples are bovine seminal RNase and **angiogenin**. [From ribonuclease with special biological action.]

RISC *abbr.* for RNA-induced silencing complex; a ribonucleoprotein complex that targets its perfectly (or partially) complementary mRNA for either cleavage or translational repression. Short interfering RISC (siRISC) is programmed by siRNA, and micro RISC (miRISC) by miRNA. Both siRISC and miRISC are of two types, cleaving and noncleaving. It is likely that this specificity is determined by one of the **argonaute** proteins.

RIST *abbr.* for radioimmunosorbent test.

ristocetin a glycopeptide antibiotic complex from *Nocardia lurida*. Ristocetin A, *M_r* 2066, acts primarily on Gram-positive bacteria by inhibiting the biosynthesis of peptidoglycans of cell walls. It is particularly useful against infections of the gut when administered by injection, but not when taken orally, and has toxic side effects including kidney damage.

RITS *abbr.* for RNA-induced transcriptional gene silencing or RNA-induced initiation of gene silencing.

Rittenberg tube an evacuable two-legged tube provided with a stopcock and used for the conversion of ¹⁵N-labelled ammonium salts into dinitrogen prior to mass-spectrometric analysis. It has

been jocularly known, especially in Israel, as **Rittenberg's trousers**. [After David Rittenberg (1906–70), US biochemist.]

Rituximab a monoclonal antibody active against non-Hodgkin's lymphoma (NHL). In some cases of NHL there is present a chemokine CD20, which arises due to the translocation of a gene from chromosome 14 to 18. The oncogene is *BCL2*, which is responsible for the overexpression of CD20. Thus rituximab is an anti-CD20 agent. The higher the grade of NHL the less likely it is to have CD20 receptors. The proprietary name is Mabthera.

R loop the structure formed when an RNA of complementary sequence stably base pairs with one of the DNA strands of double-stranded DNA, as happens at the start of **transcription**.

r.m.m. *abbr.* for relative molecular mass.

RMS *abbr.* for root mean square.

RMSD *abbr.* for root mean square deviation.

Rn *symbol* for radon.

RNA *abbr. and common name* for **ribonucleate** (def. 1) or **ribonucleic acid**; one of the two main types of **nucleic acid**, consisting of a long, unbranched macromolecule formed from ribonucleotides, the 3'-phosphate group of each constituent ribonucleotide (except the last) being joined in 3',5'-phosphodiester linkage to the 5'-hydroxyl group on each ribose moiety of the next one. The presence of a free 2'-hydroxyl group on each ribose moiety renders these phosphodiester bonds susceptible to hydrolytic attack by alkali, in contrast to those of **DNA**. The RNA chain has polarity, with one 5' end and one 3' end. Two purines, adenine and guanine, and two pyrimidines, cytosine and uracil, are the major bases usually present. In addition, **minor bases** may occur; **transfer RNA**, however, contains unusual bases in relatively large amounts. The sequence of bases carries information, whereas the sugar and phosphate groups play a structural role. RNA is fundamental to **protein biosynthesis** in all living cells. **Messenger RNA** (mRNA) is responsible for carrying the coded genetic 'message', transcribed from DNA, to sites of protein assembly at the **ribosomes**. The latter are composed of **ribosomal RNA** (rRNA) plus proteins. A third species, transfer RNA (tRNA), is instrumental in importing amino acids to the assembly site, according to instructions carried by mRNA. In some viruses, RNA is the genetic material instead of DNA. Specific forms, functions, molecules, or preparations of RNA may be designated by prefixes or suffixes, thus: A-RNA or RNA-A, **A-form** of RNA; cRNA, **complementary RNA**; dsRNA, double-strand(ed) RNA; hnRNA or H-RNA or HnRNA, **heterogeneous nuclear RNA**; mRNA, **messenger RNA**; micRNA, **messenger-RNA-interfering complementary RNA**; mtRNA, **mitochondrial RNA**; nRNA, nuclear RNA; rRNA, **ribosomal RNA**; sRNA or S-RNA, **soluble RNA**; scRNA, small cytoplasmic RNA; snRNA, **small nuclear RNA**; snoRNA, **small nucleolar RNA**; ssRNA, single-strand(ed) RNA; tRNA, **transfer RNA**; tcRNA, **translational-control RNA**; Z-RNA or RNA-Z, **Z-form** of RNA.

RNA I a short 108 nucleotide plasmid-encoded transcript that is antisense to the 5' end of RNA II, with which it forms a duplex. It acts as a negative regulator of plasmid replication as it inhibits the action of RNase H on **RNA II**. Pairing between RNA I and RNA II is facilitated by the Rop protein.

RNA II a plasmid-encoded transcript that initiates 555 bp upstream from the Col E1 origin of replication. Its cleavage by RNase H leaves a primer with a 3'-hydroxy end that is used for initiating DNA synthesis during plasmid replication.

RNA-activated protein kinase *see* **PKR**.

RNA adenylating enzyme *see* **polynucleotide adenyltransferase**.

RNAase (*sometimes*) *abbr.* for ribonuclease; RNase is more usual.

RNA-dependent DNA polymerase *another name* for RNA-directed DNA polymerase (*see* **reverse transcriptase**).

RNA-dependent RNA replicase *see* **RNA-directed RNA polymerase**.

RNA-directed RNA polymerase EC 2.7.7.48; *other name*: RNA nucleotidyltransferase (RNA-directed); an enzyme that catalyses a reaction between a nucleoside triphosphate and RNA_n to form RNA_{n+1} and pyrophosphates; it is required for the replication of RNA viruses; in the case of eukaryotic viruses, the enzyme normally comprises several subunits.

RNA-DNA virus *a former name* for **retrovirus**.

RNA editing *see* **editing** (def. 2).

RNA editing enzyme or **RNA-dependent deaminase** (*abbr.*: RED);

any enzyme that catalyses deamination of a nucleotide base (e.g. cytosine to uracil; adenine to inosine) at a specific site in RNA. *See* **APOBEC1**.

RNA helicase an ATP-dependent enzyme that is similar to **DNA helicase** except that its substrate is RNA. An example is the *dbpA* gene product from *Escherichia coli*, which is specific for 23S rRNA.

RNAi *abbr.* for RNA interference.

RNA-induced silencing complex *see* **RISC**.

RNA-interacting module any peptide sequence in a polypeptide that binds RNA, e.g. G-patch and some zinc fingers (of C2H2 and C4 types).

RNA interference (*abbr.*: RNAi) or **post-transcriptional gene silencing** a general mechanism for silencing the transcript of an active gene in many organisms. The interference is initiated by **siRNA** (as part of an RNA-induced silencing complex; *see* **RISC**) that is specific for the nucleotide sequence of the target transcript. There is no evidence that this type of silencing occurs in normally growing animals, but it has been demonstrated in *Caenorhabditis elegans* and is used by plants to combat virus infection.

RNA ligase (ATP) EC 6.5.1.3; *other name*: polyribonucleotide synthase (ATP); an enzyme from bacteriophage T4 that catalyses ATP-dependent ligation of single-stranded RNA or DNA onto the 5'-phosphate terminus of single-stranded RNA or DNA molecules:

RNA polymerase any enzyme that utilizes ATP, GTP, CTP, and UTP to synthesize RNA from a DNA or RNA template. DNA-dependent RNA polymerases include (i) the enzymes responsible for transcription of DNA and (ii) **primases**, which synthesize the RNA primers required for replication of DNA. An **RNA-directed RNA polymerase** (replicase or RNA synthetase) is involved in the replication of RNA viruses.

DNA-dependent (or DNA-directed) RNA polymerase (EC 2.7.7.6); *other name*: RNA nucleotidyltransferase (DNA-directed); it catalyses a reaction between a nucleoside triphosphate and RNA_n to form RNA_{n+1} and pyrophosphate. This EC class number includes the following examples.

In prokaryotes one DNA-dependent RNA polymerase transcribes all classes of DNA. The core *Escherichia coli* enzyme consists of three types of subunit, α , β , and β' , and has the composition $\alpha_2\beta\beta'$; the holoenzyme contains an additional σ subunit or sigma factor. **Sigma factors** are responsible for specific promoter recognition and transcription initiation. Following transcription initiation, the sigma factor dissociates from the core enzyme. The β subunit is probably involved in binding ribonucleotide substrates; it is the target for **rifamycin** and **streptolydigin** antibiotics. The β' subunit may bind template DNA.

Phage RNA polymerases are much smaller and simpler than bacterial ones: the polymerases from phage T3 and T7 RNA, e.g., are single polypeptide chains of <100 kDa.

Eukaryotes have three types of DNA-dependent RNA polymerase in the nucleus, each producing a different type of RNA. RNA polymerase I, located in the nucleolus, synthesizes precursors of most ribosomal RNAs; RNA polymerase II, located in the nucleoplasm, synthesizes messenger RNA precursors; and RNA polymerase III, also located in the nucleoplasm, synthesizes the precursors of 5S rRNA, the transfer RNAs, and other small RNAs. These enzymes can be distinguished by their sensitivity to α -amanitin (*see* **amanitin**); class I enzymes are not inhibited by this octapeptide, whereas class II enzymes are rapidly inhibited by low concentrations; the sensitivity of class III enzymes varies depending on species. **RNA polymerase I** has 13 subunits totalling over 600 kDa; it recognizes a single type of promoter and requires at least two ancillary factors, UBF1 and SL1; it accounts for 50–70% of the RNA polymerase activity in eukaryotic cells. **RNA polymerase II** from all sources contains two large subunits of 215 and 139 kDa and several smaller polypeptides. The 215 kDa subunit has homology with the prokaryotic β' subunit and contains a C-terminal domain (CTD) with multiple repeats of the consensus sequence YSPTSPS; the CTD is involved in initiation. The 139 kDa subunit has homology with the bacterial β subunit; the third largest subunit is related to

the bacterial α subunit. Three of the remaining subunits are common to RNA polymerases I, II, and III. Most promoters used by RNA polymerase II contain the **TATA box**, which is recognized by the TATA-binding protein (TBP), a component of the **transcription factor** TFIID. Several other accessory factors are required for transcription by RNA polymerase II. **RNA polymerase III** has 14 subunits totalling 700 kDa. The promoters it uses may be upstream of the transcribed gene (for snRNAs) or within the gene (for tRNAs and 5S RNA). Three accessory factors, TFIIA (a **zinc-finger** protein), TFIIB, and TFIIC, are involved in transcription from internal promoters.

Mitochondria and chloroplasts also contain RNA polymerase activity that synthesizes the RNAs required for protein synthesis in these organelles. These polymerases are smaller than the nuclear enzymes and more like prokaryotic RNA polymerases.

[RNA-polymerase]-subunit kinase EC 2.7.1.141; *other name*: CTD kinase (*abbr.* for C-terminal domain kinase); an enzyme that catalyses a reaction between ATP and [DNA-directed RNA polymerase] to form phospho-[DNA-directed RNA polymerase] and ADP.

RNA primer a segment of RNA (60 nt long in prokaryotes, depending on species) that is complementary to a segment of the template DNA and is formed by DNA **primase** during the initiation of DNA replication. *See* **replication of DNA**.

RNA processing the splicing, 5'-capping, and 3'-polyadenylation by which eukaryotic pre-mRNA is converted into mature mRNA. All three processes are associated with the C-terminal domain of the largest subunit of the **RNA polymerase II** complex. *See* **cap**; **poly(A) tail**; **splicing** (def. 2).

RNase *usual abbr.* for ribonuclease; *compare* **RNAase**.

RNase III a dsRNase such as **Dicer** and **Drosha** involved in the production of siRNA and miRNA respectively. *See also* **ribonuclease**.

RNase A *abbr.* for ribonuclease A (pancreatic ribonuclease). *See* **ribonuclease**.

RNase B *abbr.* for ribonuclease B; a glycosylated form of ribonuclease A with the same specificity. *See* **ribonuclease**.

RNase H *abbr.* for ribonuclease H. *See* **ribonuclease**.

RNase MRP a site-specific endoribonuclease for mitochondrial RNA processing (hence 'MRP'). It contains an essential RNA component and cleaves mitochondrial RNA (mtRNA) transcripts that are complementary to the D-loop region of vertebrate mtDNA.

RNase ONE a *proprietary name* for RNase I from *E. coli* that catalyses hydrolysis of phosphodiester bonds after all four ribonucleotides.

RNase OUT a *proprietary name* for a formulation for removing RNase and DNase from laboratory surfaces.

RNase P *abbr.* for ribonuclease P. *See* **ribonuclease**.

RNase T1 *abbr.* for ribonuclease T1; a single-stranded RNA (or DNA) endonuclease from *Aspergillus* that cleaves after guanine residues. *See* **ribonuclease**.

RNA silencing or **cosuppression** or **post-transcriptional gene silencing** (*abbr.*: PTGS); **RNA interference** in plants that is induced by viruses as a general antiviral defence mechanism. Many plant viruses encode proteins that are suppressors of silencing. When triggered locally, it can spread via a mobile silencing signal.

RNasin a *proprietary* recombinant ribonuclease inhibitor, similar to human placental RNase inhibitor, that acts by forming stable non-covalent complexes with ribonuclease.

RNA synthetase an RNA-directed **RNA polymerase**.

RNA tumour virus a common designation for **retrovirus**, as this is the only group of RNA viruses known to cause cancer.

RNP *abbr.* for ribonucleoprotein. Specific kinds of RNP may be designated by prefixes, thus: hnRNP, **heterogeneous nuclear ribonucleoprotein**; scRNP, **small cytoplasmic ribonucleoprotein**; snRNP, **small nuclear ribonucleoprotein**.

RNPase or **RNP disruptase** a putative enzyme that disrupts RNA-protein interactions.

RNP disruptase an *alternative name* for **RNPase**.

Ro an RNA-binding protein and autoantigen in human systemic lupus erythematosus (SLE). Mice that lack Ro develop antibodies against ribosomes and chromatin and have glomerulonephritis and skin photosensitivity as in SLE. Ro also enables the nematode

Caenorhabditis elegans to withstand environmental stress, and some bacteria to withstand UV irradiation.

Robertsonian translocation any translocation in which the long arms of two acrocentric chromosomes fuse at the centromere. In humans, chromosomes 13, 14, 15, 2, and 22 are most commonly involved, especially 13 and 14. Robertsonian fusion of the long arms of chromosomes 21 and 14 is responsible for about 4% of Down syndrome cases. [After W.R.B. Robertson (1881–1941), US geneticist.]

Robison ester an *old name* for D-glucose 6-phosphate. *Compare* **Neuberg ester**. [After R. Robison, British chemist (1883–1941).]

Robo or **roundabout** any of a conserved family of receptors present on the growth cones of *Drosophila* axons that do not cross the midline. They consist, in sequence, of five immunoglobulin-like domains, three fibronectin repeats, one transmembrane segment, and four cytoplasmic motifs. On binding to a slit protein they regulate intracellular GTPase-activating proteins (GAPs). In zebrafish Robo2 is called astray.

robot any device for performing computational or physical tasks automatically. For example, in computing, a robot is a program that trawls the Web for information, indexing it, say, for a search engine. In biology, robot machines execute the numerous mundane, repetitive tasks associated with high-throughput technologies (e.g. genome sequencing, drug screening). –**robotic** *adj.*; –**robotism** or **robotry** *n*.

robotics the automation of laboratory procedures in which there are a number of repetitive operations. In genomics and proteomics such operations may be performed by a robotics workstation.

ROC *abbr.* for receiver operating characteristic.

Rochelle salt potassium sodium tartrate tetrahydrate; it is used as a constituent of **Fehling's solution**. [After La Rochelle, French port.]

rocket immunoelectrophoresis *abbr.*: RIEP; a one-dimensional **electroimmunodiffusion**, also known as **electroimmunoassay**, used for quantitative analysis of proteins. Exact volumes of protein (antigen) solution are applied in an agarose gel of uniform thickness containing the corresponding antibody. An electric field causes the migration of both antigen and antibody. They react to form elongated curved precipitation lines, known as rockets because of shape, which are proportional in size to the amount of antigen. *See also* **crossed immunoelectrophoresis**.

rod cell or **rod** a rod-shaped light-sensitive cell of the vertebrate retina. Rod cells contain **rhodopsin** or (in freshwater and migratory fish and some amphibians) **porphyropsin**, and are responsible for vision in dim light. They occupy all of the margin of the retina and are absent from the fovea. Each is a highly specialized cell with an outer and inner segment, a cell body, and a synaptic region where the rod passes a chemical signal to retinal nerve cells. Phototransduction occurs in the outer segment, which contains a stack of rhodopsin-rich membrane disks. The plasma membrane of the outer segment contains cyclic-GMP-gated Na⁺ channels. These are kept open in the dark by cyclic GMP molecules bound to the channels. Metarhodopsin II, i.e. rhodopsin activated by a photon, activates **transducin**, a **G-protein**, which then activates a cyclic GMP phosphodiesterase, reducing the cellular level of cyclic GMP to initiate a nerve impulse in the optic nerve. *Compare* **cone cell**.

rod gel a gel used in a form of polyacrylamide gel electrophoresis, in which the gel is cast in cylindrical glass tubes. Now largely superseded by slab-gel electrophoresis.

roentgen a *variant spelling* of **röntgen**.

Rohypnol *proprietary name* for flunitrazepam, a **benzodiazepine** central nervous system depressant administered to treat insomnia. It is used in drug-facilitated rape ('date rape').

roller bottle a cylindrical container used for the culture of monolayers of adherent cells. *See* **roller culture**.

roller culture a method of cell culture using roller bottles in which adherent cells are bathed with culture medium as the bottle is rotated. This method of culture is used when large numbers of cells are required.

rolling circle a mechanism for the replication of circular double-stranded DNA. One strand is nicked, then, using the unbroken strand as a template, the DNA is replicated around the circle. Replication does not cease when one circumference has been repli-

cated, but continues around the circumference several more times (hence the name 'rolling'). Consequently, multimers of the replicon are produced in a long single strand with the appearance of a tail; this may then be cut into unit replicons, or into multimers containing tandemly repeated copies of the original unit; these may remain as single strands or be transcribed to yield a complementary strand.

röntgen or **roentgen** *symbol* R; the unit of **exposure** (def. 3) to X- or gamma radiation, expressed in terms of the amount of ionization caused in air. Defined originally (1928, 1937) as that quantity of radiation having a corpuscular emission per 0.001293 gram of air (equivalent of 1 cm³ of dry air at stp) producing, in air, ions carrying one electrostatic unit quantity of electricity of either sign. Expressed in SI units, 1 R causes the production in air of ions (of one sign) carrying a charge of 2.58×10^4 C kg⁻¹; this corresponds to the formation of 1.61×10^{15} ion-pairs per kg of air and to an absorption of energy by air equal to 0.00869 J kg⁻¹. The energy absorption by water or tissue from 1 R of x- or gamma-radiation is about 0.0096 J kg⁻¹. Prior to 1956, the röntgen was used in clinical work to express both exposure and **absorbed dose**. See also **rad** (def. 2), **rem**, **rep**. [After Wilhelm Konrad von Röntgen (1845–1923), German physicist, discoverer of X-rays.]

röntgen equivalent man or **röntgen equivalent man** see **rem**.

röntgen equivalent physical see **rep**.

röntgen rays a former name for **X-rays**.

room temperature ambient temperature, often used for reactions that can be carried out on the bench without devices to maintain constant temperature. Normally within several degrees of 20 °C.

root effect the lowering of ligand affinity and of cooperativity of ligand binding (in hemoglobin) brought about by a low pH. [After R. W. Root who reported it in 1931.]

root mean square *abbr.* RMS; the positive square root of the mean of the squares of a series of values of x_i :

$$\text{RMS value} = \sqrt{\left(\frac{x_1^2 + x_2^2 + \dots + x_n^2}{n}\right)}$$

Compare **standard deviation**.

root mean square deviation *abbr.*: RMSD; the square root of the sum of squared deviations of the observed values from the mean, divided by the number of observations. The RMSD gives a measure of the dispersion of points in a data set, or, in molecular structure determination, a measure of the similarity of two molecular conformations.

Rop *abbr.* for Rho-like protein of plants.

ROS *abbr.* for 1 rod outer segment; see **rod cell**. 2 reactive oxygen species.

ROS a gene family encoding receptor-tyrosine kinases of unknown function; *v-ros* is the oncogene of the acutely transforming avian sarcoma virus UR2 (named after the University of Rochester). The vertebrate gene product, Ros, is similar to the *Drosophila* **sevenless protein**; it appears to be associated with a phosphoinositide response (see **phosphatidylinositol cycle**); Ros-1 is a member of the Src family.

rosetting a method of isolating cells by allowing them to associate with red blood cells. For example, lymphocytes become surrounded with red cells, forming a 'rosette', and may then be isolated by sedimentation through **Ficoll** gradients.

Rossmann fold a super-secondary motif in protein structure comprising two adjacent β - α - β units, creating a β - α - β - α - β domain, and often containing a hydrophobic core between the closely packed sheet and helices. The Rossmann fold occurs in a variety of proteins, but was first described as the NAD(P)-binding domain in a family of dehydrogenases.

rota-evaporate to evaporate a solution in a rotating round-bottomed flask in a temperature-controlled water bath, using an apparatus that can at the same time apply a vacuum to the flask interior. —**rota-evaporation** *n*.

rotamer see **rotational isomer**.

rotary evaporator an apparatus used for **flash evaporation**; see also **rota-evaporate**.

rotational correlation time see **correlation time**.

rotational diffusion rotation of a solute molecule around its centre of mass as a result of **Brownian movement**.

rotational frictional coefficient see **frictional coefficient**.

rotational isomer molecules of identical **configuration** may be distinguished as having different **conformations** after rotation about a bond. If an assembly of atoms X–A–B–Y (X and Y not being collinear with A–B) is viewed along the axis A–B, the X–A and B–Y bonds will make an angle with each other which may be 0° (superposition), 180° or some intermediate angle. This angle is termed the torsion angle, designated θ or ψ . Conformations are then described as synperiplanar (*sp*), synclinal (*sc*), anticlinal (*ac*) or antiperiplanar (*ap*) according as the torsion angle is within $\pm 30^\circ$ of 0°, $\pm 60^\circ$, $\pm 120^\circ$, or $\pm 180^\circ$, respectively. Formerly, the terms *cis*, *gauche* and *trans* were in use for synperiplanar, synclinal and antiperiplanar respectively.

rotational strength or **rotatory strength** *symbol*: R ; an index of the degree to which an **absorption band** exhibited by an optically active solute displays **circular dichroism**. It may be evaluated for the absorption band in question by means of the expression:

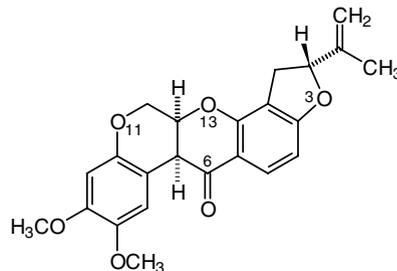

$$R = 2.296 \times 10^{-44} \int \left(\frac{\Delta \epsilon_\lambda}{\lambda} \right) d\lambda$$

where λ is a wavelength of observation and $\Delta \epsilon_\lambda$ is the difference between the molar (decadic) absorption coefficients of the left and right circularly polarized light beams at that wavelength. Rotational strength is thus essentially the absorption coefficient difference integrated over the entire absorption band.

rotation axis a crystal or an oligomeric protein molecule is said to possess an *n*-fold rotation axis if it presents exactly the same appearance after a rotation about that axis of $360^\circ/n$. Compare **screw axis**.

rotation-reflection axis see **symmetry**.

rotenone an insecticide and the active principle in derris. It is present in plants of the genera *Derris*, *Lonchocarpus*, *Tephrosia*, and *Mundulea*, used by indigenous peoples as fish poisons (*Derris* in Asia, *Lonchocarpus* in South America, and *Tephrosia* more extensively). Rotenone inhibits mitochondrial respiration on the oxygen side of the nonheme iron of NADH dehydrogenase. Extracts of rotenone-containing plants are used as insecticidal sprays and dusts (derris dust). Compare **piERICIDIN A**.

rotor 1 the part of a centrifuge that holds the material to be subjected to centrifugal force. It generally has compartments that house tubes or bottles, and these may either be set at a fixed angle with respect to the axis of rotation, or designed to allow the containers to swing out into a horizontal position during centrifugation. Centrifugal force is generated by rotating the rotor about its axis. 2 the part of the **H⁺-transporting ATP synthase** that rotates during flow of hydrons through the F₀ part of the complex. Compare **stator**.

Rotor syndrome a rare autosomal recessive benign predominantly conjugated hyperbilirubinemia. Unlike **Dubin–Johnson syndrome** it shows no liver pigmentation. A defect (of unknown nature) in canalicular multiorganic anion transporter (cMOAT) is thought to be responsible. [After Arturo Belleza Rotor (1907–88), Philippine physician.]

Rot value or **R₀t value** a measure of the kinetic complexity of RNA based on its hybridization ability. The notation is a modification of **R₀t**, where R₀ is the initial RNA concentration and *t* is time. It is analogous to the Cot value (see **C₀t**) for DNA. R₀t_{1/2} is the value cor-

responding to half complete association between complementary polynucleotides.

roughanic acid all-*cis*-7,10,13-hexadecatrienoic acid; a plant fatty acid present in storage lipids.

rough endoplasmic reticulum *abbr.*: RER; a region of the **endoplasmic reticulum** associated with ribosomes and involved in the synthesis of secreted and membrane-bound proteins. The nascent protein destined for secretion with its **signal peptide** associates with a receptor for the **signal recognition particle** and then translocates through the RER lipid bilayer by means of proteins, including **TRAM**, which form a **translocon**. The signal peptide is removed by the **signal peptidase**. The process is aided by **heat-shock proteins**, which serve as **chaperones**.

roundabout *an alternative name for Robo*.

Round-up *see glyphosate*.

rousvirus *see retrovirus*.

rP the negative decadic logarithm of the molar concentration of inorganic phosphate; i.e. $rP = -\log[P_i]$. If, for the equilibrium

$$K = [X][P_i]/[XP]$$

then

$$rP = -\log K - \log([XP]/[X]).$$

RP-HPLC *abbr.* for reversed phase high-pressure liquid chromatography; *see* **reversed phase**.

R plasmid *abbr.* for resistance plasmid.

RPM *abbr.* for Redhat Package Manager; a utility designed by the authors of the Redhat distribution of **Linux** but also implemented by other distributors of Linux. RPM files are compressed and can be found in certain **software archives**.

RPMI *abbr.* for Roswell Park Memorial Institute (Buffalo, USA).

r-protein *abbr.* for ribosomal protein.

R protein *see R gene*.

RP-TLC *abbr.* for reversed phase thin-layer chromatography; *see* **reversed phase**.

RQ *abbr.* for respiratory quotient.

RRM *abbr.* for RNA recognition motif; a conserved 80-amino-acid sequence present in a family of proteins that bind RNA. It has a β - α - β - α - β structure.

rRNA *abbr.* for ribosomal RNA; *see* **ribosome**.

Rrp *abbr.* for ribosomal RNA processing; any of a group of exonucleases that are involved in processing of RNA precursors in yeast, where they form part of the exosome core in the cytoplasm. Some Rrps catalyse a phosphorylase reaction (Rrp41p, Rrp42p, Rrp43p, Rrp45p, and Rrp46p), while others catalyse a hydrolase reaction (Rrp4p, Rrp40p, and, in the nucleus, Rrp6p).

(RS)- *prefix (in chemical nomenclature)* denoting a racemate containing a single chiral centre. *See* **sequence rule**.

R/S convention the system of configuration specification of chiral compounds based on the **sequence rule**.

R segment *abbr.* for repeat segment; part of retroviral RNA consisting of direct repeats, i.e. repeats having the same orientation; the size of the repeat varies in different strains of virus, from 80 to 100 nucleotides.

RSK *abbr.* for ribosomal protein S6 kinase; any of a family of protein serine/threonine kinases that, on binding of certain growth factors to their tyrosine-kinase receptors, translocate from cytoplasm (where they may phosphorylate ribosomal protein S6) to the nucleus (where they phosphorylate several transcription factors). RSK2 is the same as CREB (protein) kinase.

RSKG-5 *see* **tonin**.

R state *see R form*.

rtDNA (*sometimes*) *abbr.* for **recombinant DNA**; use not recommended.

RTP *symbol* for any unspecified purine nucleoside 5'-triphosphate.

RT-PCR 1 *abbr.* for reverse transcriptase-polymerase chain reaction or reverse transcription-polymerase chain reaction; a quantitative technique for amplifying DNA transcripts of cellular mRNA. **2** *sometimes* *abbr.* for **real-time PCR**; use not recommended.

rtTA *abbr.* for reverse tetracycline-controlled *trans*-activator; a chimeric transcriptional activator based on a modified DNA-bind-

ing domain of the tetracycline controlled *trans*-activator fused to the *trans*-activator domain of VP16 and used in the **Tet-On** system.

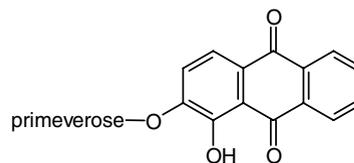

rTth a proprietary recombinant thermostable DNA polymerase originally from *Thermus thermophilus*. It has proofreading activity and is used in the generation of long (>4 kb) polymerase chain reaction (PCR) products. It also has efficient reverse transcriptase activity in the presence of manganese.

Ru *symbol* for ruthenium.

RU-486 or **RU-38486** mifepristone; 11 β -(4-dimethylaminophenyl)-17 β -hydroxy-17 α -prop-1-ynylestra-4, 9-dien-3-one; a steroidal progesterone-receptor antagonist that prevents implantation of a fertilized ovum in the uterus. It is an effective contraceptive even when taken after coitus.

rubber a *cis*-1,4-polyisoprene with M_r varying from about 1×10^5 to 1×10^6 , representing polymers of about 1500 to 60000 **isoprene** residues. It is found in the latex of about 300 different flowering plants, but only *Hevea brasiliensis* is a commercial source. A nonelastic rubber from *Manilkara bidentata* latex is known as **balata**. It is a *trans*-1,4-polyisoprene.

ruberythric acid the glycoside; 2-alizarin β -D-primeveroside, a major component of the plant dyestuff madder.

Rub 1 homologue of Nedd-8 *see* **Nedd**.

rubidium *symbol*: Rb; a silvery-white metallic element of group 1 of the IUPAC **periodic table**; atomic number 37; relative atomic mass 85.48. Highly reactive, it must be stored in an inert atmosphere. Rb⁺ may be used experimentally as a K⁺ analogue (sometimes as substitute, other times as competitor).

Rubinstein-Taybi syndrome *see* **CBP/p300**.

Rubisco *abbr.* for ribulose-bisphosphate carboxylase/oxygenase. It has **ribulose bisphosphate carboxylase** activity, and in a side-reaction with dioxygen it produces 2-phosphoglycolate (*see* **photorespiration**).

RuBP *abbr.* for ribulose 1,5-bisphosphate.

rubredoxin *abbr.*: Rd; any of a group of bacterial **iron-sulfur proteins** that are small, highly conserved, contain non-heme iron, and are non-enzymic. They lack acid-labile sulfur, and are characterized by having either one or two iron atoms each entirely in mercaptide coordination, i.e. surrounded by four cysteine residues or sulfur-containing ligands. They are electron acceptors for, e.g., hydrogenase-linked redox processes and hydroxylase systems. Rubredoxins of M_r 6 000–19 000 have been found in a number of bacteria. The ferrous form is intense red; the ferrous form is colourless. *Compare ferredoxin*.

rudimentary a gene that in *Drosophila* is the equivalent of *pyr-1* in a number of other eukaryotes. It encodes a **CAD protein**.

ruffled edge or **ruffling** the appearance of the leading edge of a moving cell in culture, caused by the extension of microspikes and lamellipodia, which when not attached to the substratum have the appearance of ruffles in flimsy dress fabric.

rule (*in sequence analysis*) a short regular expression (typically 4–6 residues in length) used to identify generic (non-family-specific) patterns in protein sequences. Rules tend to be used to encode particular functional sites (e.g. sugar attachment sites, phosphorylation sites, glycosylation sites). Their small size means that they do not provide good discrimination, and can only indicate that a certain functional site *might* exist in a sequence.

Runt a protein of *Drosophila* that is involved in sex determination, segmentation, and neurogenesis. Its DNA-binding domain is homologous with that of Lozenge (of *Drosophila*) and AML1 (of human). Several Runt-related proteins occur in mammals.

RUNT domain or **runt homology domain** (*abbr.*: RHD) a 128-amino-acid DNA-binding domain occurring in **Runt** and other proteins re-

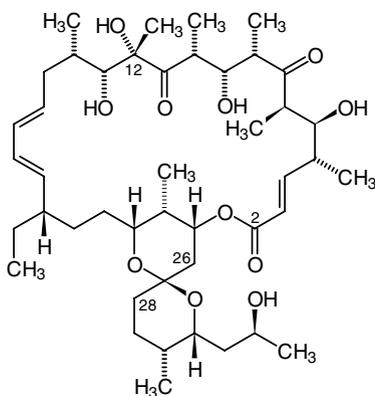

quired for the formation of hematopoietic, skeletal, gastrointestinal, and nervous systems in a variety of organisms. RHD proteins form a complex with core binding factor β (CBF β).

runt gene a *Drosophila* pair-rule gene encoding a transcription factor involved in segmentation.

Russell's viper venom the venom of Russell's viper, *Vipera russelii*, a snake of SE Asia. It is a source of enzymes especially phospholipases, proteases, and ribonucleases.

rusticyanin a blue, copper-containing, single-chain polypeptide obtained from a thiobacillus. It undergoes reduction during oxidation of Fe²⁺ with dioxygen. It is stable in acid, labile in alkali, and contains no arginine.

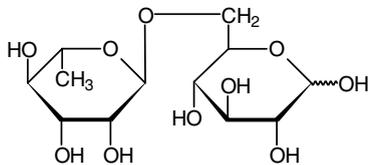

rutamycin or **oligomycin D** 26-demethyloligomycin A; an agent that is strongly inhibitory to a limited number of yeast and other fungal species. It inhibits mitochondrial ATPase F₁, preventing phosphoryl group transfer, but has no effect on isolated F₁ units. *See also* oligomycin.

rutamycin

ruthenium red ruthenium oxychloride ammoniated; [(NH₃)₅-Ru-O-(NH₃)₄-O-Ru-(NH₃)₅]Cl₆·4H₂O. A brownish-red, water-soluble inorganic compound, used in microscopy and electron microscopy as a stain for acid mucopolysaccharides. It inhibits the influx of Ca²⁺ ions into mitochondria at extremely low concentrations.

rutinose the disaccharide, 6-*O*- β -L-rhamnosyl-D-glucose; it occurs in rutin, the 3'-rutinoside of **quercetin**.

Ruv any of a family of three proteins involved in branch migration of a **Holliday junction**. In *E. coli*, Ruv A (209 amino acids) forms a homotetramer that binds the junction. Its crystal structure resembles a four-petalled flower and has four negatively charged projections at the centre. The junction fits in the concave face and is pierced at its centre by the projections. Ruv B (37 kDa) is a DNA-dependent ATPase that forms a homohexameric ring that binds dsDNA on

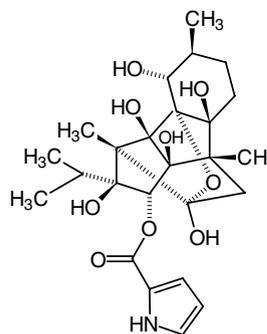

each side of the Ruv A tetramer. Ruv C (19 kDa) is a nuclease that cleaves the crossover strands of the junction.

R_B value or **relative band rate** or **relative band speed** (*in chromatography*) symbol: R_B; the ratio of the distance travelled by a zone of the substance of interest to the distance simultaneously travelled by a reference substance B. *See also* R_f value.

R_f value or **R_F value** or **band rate** or **band speed** symbol: R_f or R_F; (*in chromatography*) the ratio of the distance travelled by the centre of a zone of the substance of interest to the distance simultaneously travelled by the mobile phase. In paper and thin-layer chromatography, it is generally determined from the distance travelled by the substance from the origin and the distance travelled by the eluent front from the same point. [From 'rate relative to front']

RXR *abbr.* for **retinoid receptor**.

ryanodine a toxic alkaloid with insecticidal activity, isolated from *Ryania speciosa*. *See also* **ryanodine receptor**.

ryanodine receptor *abbr.*: RYR; any of a group of receptor proteins that bind **ryanodine**. Although first discovered in muscle, they occur in other cell types, and function as intracellular ligand-gated Ca²⁺-release channels. In muscle, they provide communication between transverse tubules (**T-tubules**) and sarcoplasmic reticulum (SR); contraction of skeletal muscle is triggered by release of Ca²⁺ from SR following depolarization of T-tubules. The Ca²⁺ channel is modulated by Ca²⁺, Mg²⁺, and calmodulin. Three types are known: RYR1, the skeletal muscle type; RYR2, the cardiac muscle type; and RYR3, a highly truncated protein found in some nonmuscle cells. Cyclic ADP-ribose activates the RYR2 but not the RYR1 receptor. In muscle the receptors are tetrameric integral transmembrane glycoproteins. The C-terminal region is on the SR lumen side and contains four transmembrane helices per subunit; the N-terminal region (the major part of the molecule for RYR1 and 2) protrudes into the cytosol, where it forms a foot region in close proximity to the voltage-gated dihydropyridine receptors in T tubules. Deficiency is associated with malignant hyperthermia.

Ryk *abbr.* for related-to-tyrosine-kinase; a subfamily of the receptor tyrosine kinase superfamily. Members of Ryk have a short extracellular region that is related to the WIF domain. Homologues occur in *Drosophila*, *Caenorhabditis elegans*, and in most mammalian tissues.

RYN method a method for determining the plausibility of an **open reading frame**. A computational analysis of the sequence determines the frequency of the favoured codons R (purine), Y (pyrimidine), and N (anything). If these are found to be in the proportions expected from that normally found, it lends support to the fact that the correct **reading frame** has been selected, and that the open reading frame is correct.

RYR *abbr.* for ryanodine receptor.

Ss

s *symbol for* **1** second (def. 1). **2** solid state (in a chemical equation). **3** atomic orbital corresponding to an orbital angular momentum quantum number (l) = 0. **4** singlet (in nuclear magnetic resonance spectroscopy). **5** strong absorption (in infrared spectroscopy).

s *symbol for* **1** sedimentation coefficient. **2** solubility. **3** (in monosaccharide nomenclature) the **septanose** form; it is suffixed to the symbol for the corresponding monosaccharide; e.g. glucoseptanose is symbolized as Glcs. **4** specific entropy (i.e. **entropy/mass**). **5** spin quantum number.

s- *abbr. for* **sec-**.

S *symbol for* **1** sulfur. **2** siemens. **3** Svedberg unit ($S_{W,20}$ is the symbol under standard conditions). **4** a residue of the α -amino acid L-serine (alternative to Ser). **5** a residue of an incompletely specified base in a nucleic-acid sequence that may be either cytosine or guanine. **6** a residue of the ribonucleoside **thiouridine** when the position of the thiol group in its thiouracil moiety is unknown or unspecified (alternative to sU or Srd). **7** substitution (reaction mechanism).

S² *symbol for* a residue of the ribonucleoside 2-thiouridine (alternative to s²U); see **thiouridine**.

S⁴ *symbol for* a residue of the ribonucleoside 4-thiouridine (alternative to s⁴U); see **thiouridine**.

S_N1 *abbr. for* unimolecular nucleophilic substitution.

S_N2 *abbr. for* bimolecular nucleophilic substitution.

S_{W,20} see **S** (def. 3).

S *symbol for* **1** entropy. **2** spin quantum number (of a system). **3** strangeness quantum number. **4** area (alternative to *A*).

S *stereochemical descriptor* denoting *sinister*; i.e. the absolute configuration of a chiral compound in which the priority (obtained using the Cahn–Ingold–Prelog sequence rules) of the substituent groups on the chiral centre decreases in an anticlockwise (left-handed) direction. For use as a prefix in chemical nomenclature, the descriptor is placed in parentheses and connected with a hyphen; e.g. (*S*)-alanine. For chiral compounds in which the relative but not the absolute configuration is known, *sinister* configuration is denoted by the prefix (*S**)-. See **sequence rule**. Compare **R**.

S- *prefix (in chemical nomenclature)* denoting substitution on a sulfur atom in a compound; a particular sulfur atom may be specified by a right superscript.

-S *conformational descriptor* designating the **skew conformation** of a six-membered ring form of a monosaccharide or monosaccharide derivative. Locants of ring atoms that lie on the side of the structure's reference plane from which the numbering appears clockwise are indicated by superscripts preceding the letter, and those that lie on the other side of the reference plane by subscripts following the letter; e.g. 1,2-*O*-ethylidene- α -D-glucopyranose-¹S₃. See also **conformation**.

s.a. *abbr. for* specific activity.

SAA *abbr. for* serum amyloid A; see **amyloid A protein**.

SABP *abbr. for* secretory actin-binding protein.

saccharase any hydrolase that hydrolyses the fructose (**fructosaccharases**) or glucose (**glucosaccharases**) end of appropriate oligosaccharides, liberating fructose or glucose respectively. The term is also used for **invertase** (which is both a fructosaccharase and a glucosaccharase).

saccharate see **glucarate**.

saccharic acid 1 *an old name for aldaric acid*. **2** *an old name for glucaric acid*; see **glucarate**.

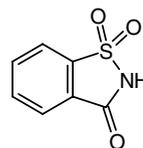

saccharide any carbohydrate, especially a simple sugar, i.e. a **monosaccharide**, **disaccharide**, or short-chain **oligosaccharide**. See also **polysaccharide**.

saccharification the hydrolysis of sugar derivatives or complex carbohydrates to soluble, fermentable sugars.

saccharimeter an instrument for measuring the amount of sugar in a solution, especially a **polarimeter** used for such a purpose. Compare **saccharometer**.

saccharin 2,3-dihydro-3-oxobenzisulfonazole; *O*-sulfobenzimide; an artificial, nonnutritive sweetener that is several hundred times sweeter than sucrose. Rats receiving high doses produce tumours of

the urinary tract but there is no clear-cut evidence of such an effect in humans.

saccharogenesis the process of producing soluble, fermentable sugars from a complex carbohydrate. —**saccharogenic** *adj.*

saccharogenic method a method for assaying amylase and similar enzymes that hydrolyse polysaccharides, based on determination of the amount of simple sugar product formed by the enzyme.

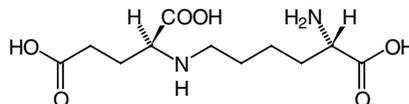

saccharometer an instrument for measuring the amount of sugar in a solution, especially a **hydrometer** specially calibrated for the purpose. Compare **saccharimeter**.

Saccharomyces a genus of budding yeasts that reproduce asexually by budding or sexually by conjugation. They are used especially as simple model organisms in the study of eukaryotic cell biology, and in genetic engineering. *Saccharomyces cerevisiae* is used in bread-making and in the production of alcoholic beverages and industrial alcohol. It divides vegetatively in either the haploid or diploid phase. This permits the isolation of recessive mutations in the haploids and complementation testing in the diploids. Transformation procedures that permit DNA uptake by either **protoplasts** or whole yeast cells have been developed and cloning vectors constructed. In cases where a recombinant **glycoprotein** is desired, yeast has proved very useful since it can, unlike bacteria, effect post-translational **glycosylation**. It has been used for the production of a vaccine for hepatitis B.

saccharopine *N*⁶-[1,3-dicarboxypropyl]-L-lysine; an intermediate in the **aminoacidic pathway** for lysine biosynthesis (e.g. in *Saccharomyces* spp., hence the name) and for lysine catabolism (e.g. in mammalian liver). The reactions involved are:

they are catalysed by **saccharopine dehydrogenases**, which are characterized as lysine-forming or glutamate-forming, and require either NAD^+/NADH or $\text{NADP}^+/\text{NADPH}$ as coenzyme; see **saccharopine dehydrogenase** (NAD^+ , L-glutamate-forming) and **saccharopine dehydrogenase** (NAD^+ , L-lysine forming). The latter is also called lysine-2-oxoglutarate reductase. In mammals both are part of the bifunctional **aminoacidic semialdehyde synthase**. See **familial hyperlysinemia**.

saccharopine dehydrogenase (NAD⁺, L-glutamate-forming)

EC 1.5.1.9; an enzyme involved in the synthesis and degradation of lysine. It catalyses the oxidation by NAD^+ of *N*⁶-(L-1,3-dicarboxypropyl)-L-lysine to L-glutamate and 2-aminoadipate 6-semialdehyde with formation of NADH . In bovine and human liver, this activity, with that of lysine-2-oxoglutarate reductase, forms part of the bifunctional aminoacidic semialdehyde synthase. Another saccharopine dehydrogenase uses the same reaction mechanism, in which the coenzyme is NADP^+ : EC 1.5.1.10, saccharopine dehydrogenase (NADP^+ : L-glutamate-forming).

saccharopine dehydrogenase (NAD⁺, L-lysine-forming) or lysine-2-oxoglutarate reductase EC 1.5.1.7; an enzyme involved in the

synthesis and degradation of lysine. It catalyses the reaction between L-lysine, 2-oxoglutarate, and NADH to form *N*⁶-(L-1,3-dicarboxypropyl)-L-lysine (**saccharopine**), NAD⁺, and H₂O. In mammals this activity, with that of saccharopine dehydrogenase (NAD⁺, L-glutamate forming), is part of the bifunctional aminoacidic semialdehyde synthase cabinet.

saccharopinuria a rare, autosomal recessive, generally benign condition in which **saccharopine** excretion in urine is prominent. It is a variant of **familial hyperlysinemia**.

saccharose *an old name for sucrose*.

Sac1p a single-pass transmembrane protein (623 amino acids) of yeast that is a polyphosphoinositide phosphatase.

SACS *abbr. for spastic ataxia of Charlevoix-Saguenay*.

sacsin a protein encoded by the single-exon gene (12 794 bp) for **spastic ataxia of Charlevoix-Saguenay**. A homologue is present in mouse. It contains two copies of a ubiquitous ATPase domain, a histidine kinase A domain, and Hsp70 DNAJ domain, and at residues 3701–3817 a domain (*see* **HEPN domain**) for which sacsins is the prototype.

Saethre–Chotzen syndrome the most common autosomal dominant craniosynostosis disorder in humans. Many mutations in **TWIST** protein cause the craniofacial and limb abnormalities.

SAF *abbr. for scaffold attachment factor*.

safety cabinet a cabinet providing an area at bench level in which pathogenic agents may be handled or stored while preventing their entry into the atmosphere outside the cabinet; at the same time, sterility within the cabinet is normally ensured. Usually the cabinet is ventilated with a stream of air, which is extracted through a **HEPA filter** system that traps any pathogens. Cabinets are classified according to the level of protection they offer. **Class I** cabinets have an inward flow of air through the front aperture providing protection for personnel and the environment. **Class II** cabinets are ventilated by a downward flow of filtered air; this is extracted so as to ensure also an inward flow through the front aperture, the extracted air being recirculated through the filter and providing protection for personnel, sample, and environment. **Class III** cabinets are for more potentially hazardous materials; there is no front aperture, the operator manipulating the interior components using gloves mechanically sealed into the front of the cabinet. They provide absolute personal, environmental, and sample protection.

SAG *abbr. for senescence-associated gene*.

SAGA complex a histone acetyltransferase complex (≈2 MDa) that can be recruited by transcription activators in yeast and in mammals. It preferentially acetylates histone H3 and contains at least 14 subunits.

SAGE *abbr. for serial analysis of gene expression*.

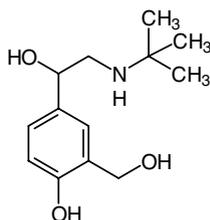

SAH *abbr. for S-adenosyl-L-homocysteine; see S-adenosylhomocysteine*.

SAICAR or **SACAIR** *abbr. for 1-(5-phosphoribosyl)-5-amino-4-(N-succinocarboxamide)-imidazole*.

SAICAR synthetase *see phosphoribosylaminoimidazole-succinocarboxamide synthase*.

Sakaguchi test a test for guanidines, i.e. arginine and peptides that contain it; in alkaline solution they give a red colour with the **Sakaguchi reagent**, which contains α -naphthol and sodium hypochlorite.

salbutamol *other name:* albuterol; 4-hydroxy-3-hydroxymethyl- α -[*tert*-butylamino]methyl]-benzyl alcohol, α '-[1,1-dimethylethyl]-amino]methyl]-4-hydroxy-1,3-benzenedimethanol; a β -adrenergic agonist whose β_2 -**adrenoceptor** activity is about 60 times that of **isoproterenol**.

salicylic acid 2-hydroxybenzoic acid; a water-soluble derivative of phenylalanine in plants, where it is formed by hydroxylation of benzoic acid. It initiates thermogenesis in the voodoo lily (in which process it has been called calorigen) and is associated with resistance to infection by fungi, bacteria, and viruses by inducing pathogenesis-related proteins. It is the active ingredient (as methylsalicylate, saligenin, or their glycosides) responsible for the analgesic action of plants such as willow, poplar, and meadowsweet, which have been used for this purpose for over two millennia. It is the active ingredient of the very versatile drug acetylsalicylic acid (*see* **aspirin**).

saline **1** of, concerned with, or containing common salt (sodium chloride). **2** of, or containing, salts of alkali metals or magnesium. **3** an aqueous solution of sodium chloride and (sometimes) other salts, of defined osmolarity, prepared for intravenous injection or perfusion; usually 0.9% w/v sodium chloride. *See also* **physiological saline**.

saliva the mixed secretions of the salivary glands and of the mucous membrane of the mouth. It contains an α -**amylase** (ptyalin), mucin, various inorganic ions, urea, buffers, lysozyme, etc., and has a pH near 7. It is secreted in response to food, which it moistens and lubricates; the amylase may also hydrolyse ingested starch. *See also* **sialic**. —**salivary** *adj.*

salivary gland any of the various glands that discharge **saliva** into the mouth. In humans there are three pairs: the parotid, sublingual, and submaxillary glands. In snakes they include the venom glands.

salivary juice the collective secretions of the salivary glands; i.e. **saliva**. Its secretion was studied by the Russian physiologist Ivan Pavlov (1849–1936), and led him to the discovery of the conditioned reflex.

Salkowski test a test for cholesterol. When concentrated sulfuric acid is added to a chloroform solution of cholesterol, the chloroform layer shows a red to blue colour and the acid layer shows a green fluorescence. [After Ernst Leopold Salkowski (1844–1923), German physiological chemist.]

Salla disease an autosomal recessive disorder, rather frequent in Finland, in which a variable degree of psychomotor retardation accompanies accumulation of free sialic acid (and glucuronic acid) in lysosomes and excessive excretion of sialic acid in urine. Patients have a near normal lifespan. It is caused by mutations in the gene for **sialin**, and is a milder form of infantile sialic acid storage disease.

salmine a 6–7 kDa **protamine**, found in salmon sperm.

salmon any of various fish of the family Salmonidae, which live in coastal waters of the North Atlantic and North Pacific and breed in rivers. Their flesh is comparatively rich in oils with a high content of long-chain *n*-3 **fatty acids**; typical composition (major fatty acids, expressed as % of total fatty acids): 16:0, 10; 16:1(*n*-7), 5; 18:0, 4; 18:1(*n*-9), 24; 18:2(*n*-6), 5; 18:3(*n*-3), 5; 20:1(*n*-9), 1; 20:4(*n*-6), 5; 20:5(*n*-3), 5; 22:6(*n*-3), 17.

Salmonella a genus of rod-shaped, motile, aerobic bacteria including the agents responsible for typhoid fever (*S. typhi*), some types of food poisoning, and other enteric diseases.

Salmonella mutagenesis test or **Ames test** a method of screening chemicals for carcinogenicity by their mutagenic effect on selected strains of *Salmonella typhimurium* – there being a high correlation between mutagenicity and carcinogenicity. The strains normally used are those that require histidine. They are plated out on histidine-deficient medium after being mixed with the potential mutagen. Mutations induced by the test substance that restore the ability to synthesize histidine are revealed by colonies growing on the plate.

salmon sperm DNA a preparation of DNA used for prehybridization, and hybridization, of membranes used for Northern or Southern blotting of mammalian RNA and DNA. It is chosen because its evolutionary distance from mammals makes it unlikely to bind DNA probes under the conditions of hybridization.

salt **1** any member of a class of compounds formed, together with water, by reaction of an acid with a base (most commonly an inorganic acid and metallic base). **2** or **common salt** sodium chloride.

saltation **1** the action of jumping or leaping. **2** proceeding in a discontinuous manner by leaps interspersed by periods of rest. **3** an ir-

reversible and inherited change in a cell or organism due to mutation. —**saltatory adj.**

saltatory conduction the passage of a nerve impulse across a gap, as between the nodes of Ranvier in a myelinated nerve fibre.

saltatory evolution evolution by sudden changes or by periods of active change with intervening inactive periods.

saltatory replication a hypothetical, sudden lateral replication of DNA thought to be responsible for the production of families of similar nucleotide sequences.

salt bridge 1 a tube, usually closed with porous plugs, that is filled with a solution of a salt (often potassium chloride, commonly saturated) and used to obtain electrical contact between two electrolytic half-cells without intermingling of their respective electrolytes. **2** any electrostatic bond, between positively and negatively charged groups on amino-acid residues of a protein, that contributes to the stability of the protein structure.

salt fractionation the differential precipitation of proteins, or nucleic acids, from solution by the addition of neutral salts, often ammonium sulfate. *Compare salting out.*

salting in the increase in the solubility of certain proteins (e.g., globulins) and dipolar ions (e.g., cystine), produced in solutions of low ionic strength by an increase in the concentration of neutral salts.

salting out the decrease in the solubility of proteins, gases, uncharged molecules, and, in sufficiently concentrated solutions, electrolytes, produced in solutions of high ionic strength by an increase in the concentration of neutral salts.

salting-out chromatography a method of chromatography whereby water-soluble organic compounds are separated by ion-exchange chromatography by use of an aqueous salt solution as eluent.

salting-out constant *symbol:* K'_s ; the slope of the straight line relating the logarithm of the solubility of a substance in neutral salt solutions and the ionic strength. It is given by

$$K'_s = -[\log(s/s^*)]/I,$$

where s is the solubility in mol dm⁻³ at ionic strength I , and s^* is the hypothetical solubility at zero ionic strength.

salt link or salt linkage an ionic bond.

salvage pathway any metabolic pathway that utilizes for biosynthetic purposes compounds formed in catabolism. Thus, free purine and pyrimidine bases may be converted to the corresponding ribonucleotides. In the case of purines, the ribose phosphate moiety of 5-phospho- α -D-ribose diphosphate (I) is transferred to the purine; thus

See also purine biosynthesis.

SAM *abbr. for S-adenosylmethionine.*

SAMase *abbr. for S-adenosylmethionine cleaving enzyme (S-adenosylmethionine hydrolase; EC 3.3.1.2).*

same-sense mutation *an alternative name for silent mutation.*

sample a small, separated portion of the whole. In experimentation it is often essential that the sample be fully representative of the characteristics of the whole (and always so for a **statistical sample**).

sample applicator a device to aid application of samples to chromatography plates, etc.

sample well a hole cut in an electrophoresis gel in which the sample to be analysed is placed.

sampling error (*in statistical analysis*) the chance difference between a measurement obtained from a **sample** and the corresponding measurement obtained from the whole population.

Sandhoff's disease *see gangliosidosis.*

sandwich assay or **sandwich technique** a type of immunoassay in which antibody against the antigen to be assayed is bound to a solid surface (e.g. plastic). After addition of solution containing antigen the fixed antigen is washed. A second antibody, which is radioactive or fluorescent, is added, sandwiching the antigen; after removal of excess, the amount of bound label is determined. The second antibody may be specific for a different epitope on the antigen, thus enhancing overall specificity, or for the first antibody bound to an antigen.

sandwich complex a 2:1 macrocycle:cation complex in which the metal ion is held between two parallel macrocyclic **complexones**.

sandwich technique *an alternative name for sandwich assay.*

sandwich test an immunohistochemical procedure employing a **sandwich assay** to detect an antibody within a cell.

Sanfilippo syndrome A *an alternative name for mucopolysaccharidosis type IIIA.*

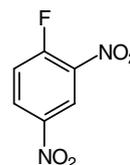

Sanfilippo syndrome B *an alternative name for mucopolysaccharidosis type IIIB.*

Sanfilippo syndrome C *the alternative name for mucopolysaccharidosis IIIC.*

Sanfilippo syndrome D *the alternative name for mucopolysaccharidosis IIID.*

Sanger method 1 (for identifying and estimating N-terminal amino-acid residues of polypeptides) a method in which free unprotonated amino groups react with 1-fluoro-2,4-dinitrobenzene (FDNB). The dinitrophenylamino groups formed are stable to the acid used to hydrolyse the peptide bonds; the yellow arylated (DNP-) amino acids so released can then be identified by chromatography and estimated spectrophotometrically. **2** (for polypeptide sequencing) a general method for deriving the primary sequence of a polypeptide chain, based on selective hydrolytic degradation of the chain into smaller peptides. The sequence of each smaller peptide may then be found by use of FDNB to label its N-terminal amino acid, together with total hydrolysis to give the amino-acid composition and further stepwise degradation by use of carboxypeptidase or by **Edman degradation**. By selection of degradation procedures to ensure overlap of sequences between the various smaller peptides, the overall sequence of the starting material may be determined. **3** (for DNA sequencing) *an alternative name for chain-termination method.* [After Frederick Sanger (1918–), British biochemist.]

Sanger's reagent 2,4-dinitrofluorobenzene (*abbr.:* DNFB); 1-fluoro-2,4-dinitrobenzene (*abbr.:* FDNB); a substance used in structural protein chemistry to arylate free amino groups. *See Sanger's method* (def. 1, 2).

sanitizer a substance that significantly reduces the bacterial population in the inanimate environment but does not destroy or eliminate all microorganisms. *Compare disinfectant, sterilant.*

SAP *abbr. for 1 Sin 3-associated protein; see Sin 3-HDAC. 2 serum amyloid P-component. 3 sphingolipid activator protein. 4 see SAP domain.*

SAP domain *abbr. for SAF-A/B, Acinus, and PIAS domain; a peptide sequence (35 amino acids) predicted to form two DNA-binding amphipathic alpha helices and present in proteins involved in chromosomal organization (e.g. SAF-A/B, Acinus, and PIAS).*

sapecin an insect **defensin** that is active against (mainly Gram-positive) bacteria. It has a high affinity for **cardiolipin**.

SAPK *abbr. for stress-activated (or stress-associated) protein kinase.*

sapogenin any of the **aglycon** moieties of **saponins**; they may be steroids or triterpenes.

saponifiable fraction the portion of total lipid that, after treatment with hot alkali, is soluble in water and insoluble in ether.

saponifiable lipid any **lipid** that can be hydrolysed with alkali to give soap (fatty-acid salts) as one product; they include any **glycolipid**, **cholesteryl ester**, or **sphingolipid**.

saponification the hydrolysis of an **ester** by an alkali to give the alcohol and salt of the acid. Originally the term meant the hydrolysis of a neutral fat by alkali (e.g. potassium hydroxide) into glycerol and a soap. —**saponify** *vb.*

saponification equivalent the amount in grams of an ester that

consumes one gram-equivalent of alkali in **saponification**. *Compare saponification number.*

saponification number the number of milligrams of potassium hydroxide consumed in the complete **saponification** of one gram of any particular fat, oil, or wax. *Compare saponification equivalent.*

saponin any of the glycosides, widely distributed in plants, that are powerful **surfactants**. Each saponin consists of an aglycon moiety (i.e. **sapogenin**), which may be a steroid or a triterpene, and a sugar moiety, which may be glucose, galactose, a pentose or methylpentose, or an oligosaccharide. All saponins foam strongly when shaken with water. They are membrane-active, powerful hemolytic agents and are used at low concentrations to **permeabilize** cells. They are highly toxic on injection, but not on ingestion as they are not absorbed through the gut. *See also digitonin.*

saponin detoxifying enzyme an enzyme that prevents activity of antifungal **saponins**.

sapor that which is sensed by taste; any quality relating to taste or odor. —**saporific** or **saporous** *adj.*

saporin a type I **ribosome-inactivating protein**, EC 3.2.2.22, from the soapwort, *Saponaria officinalis*.

saposin or **sphingolipid activator protein** any of a group of peptide cofactors of enzymes for the lysosomal degradation of sphingolipids. They stimulate various enzymes, including glucosylceramidase, galactosylceramidase, cerebroside-sulfatase, α -galactosidase, β -galactosidase, and sphingomyelin phosphodiesterase. Saposins A to D are known. Deficiency of any may cause a mild form of a **sphingolipidosis** that normally results from deficiency of an enzyme the saposin activates. They contain characteristic domains, known as saposin A-type or B-type domains. As examples, from the human precursor, saposin A and saposin C together stimulate hydrolysis of glucosylceramide by β -glucosylceramidase (EC 3.2.1.45) and of galactosylceramide by β -galactosylceramidase (EC 3.2.1.46). Saposin C deficiency causes a variant of **Gaucher's disease**. Saposin B is a homodimer, and forms a solubilizing complex with the substrates of the sphingolipid hydrolases; deficiency causes a variant of **metachromatic leukodystrophy**. Saposin D is a specific activator of sphingomyelin phosphodiesterase (EC 3.1.4.12), and deficiency causes a variant of **Tay-Sachs disease** (G_{M2} gangliosidosis). *See also swaposin.*

saprophyte any plant, fungus, or microorganism that lives on dead or decaying organic matter. —**saprophytic** *adj.*

saquinavir a peptidomimetic antiviral drug that contains phenyl and other bulky groups and inhibits HIV protease by binding to its active site.

SAR *abbr.* for scaffold-associated region; *other name*: matrix-associated region (*abbr.*: MAR). A DNA sequence of interphase chromosomes that binds them to the nuclear matrix.

SARA *abbr.* for Smad anchor for receptor activation; a protein that recruits Smad2 to transforming growth factor β receptors for phosphorylation by their protein serine/threonine kinase. *See Smad.*

sarafotoxin any of the toxic peptides from the burrowing asp, *Atractaspis engaddensis*. They cause cardiac arrest when injected into mice, and are strong vasoconstrictors. All have 21 amino acids, with four cysteine residues in identical positions and tryptophan at the C terminus. They are homologous with **endothelins** and have endothelin receptor agonist action. Sarafotoxin S6D has the sequence

CTCKDMDTKECLYFCHQDIHW.

See also bibrotoxin.

Saran Wrap *proprietary name* for a vinylidene chloride copolymer cling-film used for gel drying, food storage, etc.

α -sarcin a cytotoxin produced by *Aspergillus giganteus*. It has ribonuclease activity, specific for purines in both single-stranded and double-stranded RNA. It inhibits protein synthesis, cleaving a single phosphodiester linkage between guanosine and adenosine residues in 28S rRNA in the 60S' subunit of the eukaryotic ribosome, resulting in loss of 393 nucleotides from the 3' end of 28S rRNA. This single site of action in the intact ribosome contrasts with its action on purified 28S rRNA, in which it causes extensive degradation, cutting on the 3' side of every adenine or guanine.

sarcoglycan a complex of proteins found in skeletal and cardiac muscle, associated with the dystrophin glycoprotein complex but of

unknown function. It consists of four type I transmembrane proteins: α , (50 kDa), also known as adhalin; β (43 kDa); γ (35 kDa); and δ (35 kDa). The α , γ , and δ proteins are expressed exclusively in muscle, whereas the β protein occurs predominantly in muscle. Mutation in any of them causes limb-girdle muscular dystrophy.

sarcolemma the outer membrane of a muscle fibre. It consists of the plasma membrane, a covering basement membrane (about 100 nm thick and sometimes common to more than one fibre), and the associated loose network of collagen fibres. The term was first used to designate the line visibly marking the outer fibre edge.

sarcoma a malignant tumour of connective tissue or of its derivatives. —**sarcomatous** *adj.*

sarcomere the functional unit of a myofibril of vertebrate muscle, about 2.3 μ m long. In **striated muscle** the sarcomeres of many parallel myofibrils are positioned such that myosin **thick filaments** are aligned in register across the myofibril (having a dense appearance in microscopic preparations), as also are the actin **thin filaments** (which have a lighter appearance), resulting in the alternation of light, isotropic bands known as **I bands**, and dark, anisotropic bands known as **A bands**; the I band is bisected by a very dense, narrow **Z line**, while the central, less dense region of the A band is known as the **H zone**, which in turn is bisected by the dark **M line**, or midline, the location of specific proteins that link adjacent thick filaments to each other. The Z lines are due to attachment sites for thin filaments.

sarcoplasm all of the contents of a muscle fibre except nuclei. The sarcoplasm is pervaded by the **sarcoplasmic reticulum**. *Compare cytoplasm.* —**sarcoplasmic** *adj.*

sarcoplasmic reticulum *abbr.*: SR; a fine reticular membranous network that pervades the **sarcoplasm** of a muscle fibre. Like the endoplasmic reticulum the SR is continuous over large portions of the cell, it has a large surface-to-volume ratio, and is continuous with and/or homologous to the nuclear envelope. At the level of the I band (*see sarcomere*), the SR forms dilated sacs, or cisternae. Opposite the I bands and Z lines of every sarcomere two SR terminal sacs face each other across a narrow space, through which run **T tubules**. At the level of the A-I junction longitudinally orientated SR sacs run along the fibril, forming a pallsade around the A band. The SR contains a Ca^{2+} -translocating ATPase that moves Ca^{2+} into the SR during ATP hydrolysis; ATP resynthesis is associated with movement of Ca^{2+} out of the SR vesicles.

sarcosine *N*-methylglycine; an intermediate in the conversion of choline, via betaine and dimethylglycine, to glycine, and in the synthesis of choline from glycine. *See also sarcosinemia.*

sarcosine dehydrogenase EC 1.5.99.1; a mitochondrial flavoprotein enzyme that catalyses the reaction:

The flavin is FAD. The acceptor is electron-transfer flavoprotein.

sarcosinemia or (*esp. Brit.*) **sarcosinaemia** a rare inherited metabolic disease of humans, also found in ethylnitrosourea-induced mutants of mice, giving elevated plasma and urine levels of **sarcosine**. Primary sarcosinemia results from deficiency of **sarcosine dehydrogenase** (EC 1.5.99.1). Sarcosinemia may also be caused by folate deficiency (*see folic acid*) in humans, and occur in glutaric aciduria type II, but in primary sarcosinemia elevated levels of other organic acids are not found. Inheritance is probably autosomal recessive.

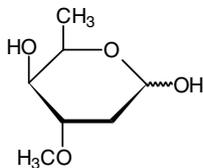

sarcosome a subcellular organelle found in muscle tissue with similar biochemical properties as a **mitochondrion** in other tissues. In muscles that are largely anaerobic, such as skeletal muscles of vertebrates and invertebrates, sarcosomes are found near the I bands (*see sarcomere*). In predominantly aerobic muscles, such as bird and insect flight muscles and vertebrate heart muscle, sarcosomes are found near the A bands.

sarcotubule *another name* for **T tubule**.

sarin methylphosphonofluoridic acid 1-methylethyl ester; an **organophosphate** (def. 2) that inhibits acetylcholinesterase and other serine esterases. It is a nerve gas but is useful in the treatment of leprosy and has some effect on AIDS.

Sarkosyl sodium lauroyl sarcosinate; a mild anionic surfactant used for solubilizing membrane proteins.

D-sarmentose 2,6-dideoxy-3-*O*-methyl-D-xylo-hexose; a substance found as a component of some **cardiac glycosides**.

SARS *abbr.* for severe acute respiratory syndrome. *See* **coronavirus**.

satellite colony any of numerous small bacterial colonies that can surround a large antibiotic-resistant colony when grown on nutrient agar plates. When the antibiotic is ampicillin the secretion of β -lactamase by the resistant colony depletes the antibiotic in the surrounding medium thereby permitting nonresistant bacteria to grow in that zone.

satellite DNA a fraction of DNA, amounting to 10% or more of total DNA in most eukaryotic cells, with a highly repetitive nucleotide sequence. Its base composition gives rise to a 'satellite' band having a different buoyant density when DNA preparations, following **shear** force degradation, are centrifuged in cesium chloride density gradients. Mouse satellite DNA contains about a million copies of a sequence of 300 bp with a lower (G+C) content than that of the moderately repetitive and unique DNA sequences. *See also* **minisatellite**.

satellite RNA small RNAs (\approx 350 bases) also called **virusoids**, found in plants; they are **encapsidated** by some plant viruses. *See also* **ribozyme**.

satellite virus a small virus that occurs in association with another virus, upon which it is dependent. **Satellite tobacco mosaic virus** (STMV) is a 172 Å diameter particle containing a 1059 nt RNA that encodes only two proteins, the 159-residue viral coat protein and a 58-residue protein of unknown function. STMV can only multiply in cells coinfecting with tobacco mosaic virus.

saturable capable of undergoing **saturation** (def. 5). —**saturability** *n*.

saturated fatty acid any **fatty acid** in which the carbon-carbon bonds of the alkyl chain are exclusively single bonds. The predominant natural ones are **palmitate** and **stearate**; others include **laurate**, **myristate**, arachidate (*see* **arachidic acid**), behenate (*see* **behenoyl**), **lignocerate**, and cerotate (*see* **ceretoyl**). They can all be derived metabolically from acetyl-CoA, in animals and plants. *See also* **fatty-acid nomenclature**.

saturates *an informal term for saturated fatty acids*.

saturation 1 (of a chemical compound) the point at which all the valence bonds of the component atoms are satisfied, especially the state of an organic compound that contains only single carbon-carbon bonds. **2** (of a solution) the state in which it has the greatest concentration of the solute that can remain in stable equilibrium with undissolved solute at a given temperature and pressure. **3** (of a gas) the state in which there is the greatest concentration of the vapour associated with a liquid or solid that can remain in stable equilibrium with unvaporized liquid or solid, respectively, at a given temperature and pressure. **4** (of an active site of an enzyme or transporter) the point at which the site is fully occupied with ligand. Saturable enzyme or receptor systems exhibit hyperbolic or sigmoid curves of activity versus concentration (*see* **saturation kinetics**). **5** the act or process of bringing to or towards saturation; especially the addition of hydrogen to triple and double bonds.

saturation analysis or **binding assay** a development of **isotope dilution analysis** used for the measurement of very low concentrations of biologically active substances in small samples of complex mixtures such as biological fluids. The essential steps are: (1) the substance, S, is allowed to react with a fixed amount of a specific binding agent under conditions such that the latter is always fully saturated with S; (2) the partitioning of S between the free and bound states is determined by the use of an indicator and by physical separation of the free from the bound form; and (3) the distribution of the indicator is compared with distributions obtained using a series of known

amounts of S. The indicator is a form of pure S labelled with a radioisotope of high specific activity; alternatively, fluorescent, enzymic, or other labels may be used if they give the required sensitivity. The specific binding agent is generally an antibody, as in **enzyme immunoassay**, **fluoroimmunoassay**, or **radioimmunoassay**, or a naturally occurring macromolecular carrier or cellular receptor, as in **competitive protein-binding assay**.

saturation fraction *symbol:* y ; the ratio of the concentration of bound ligand to the total concentration of the binding agent. Hence, in a binding reaction where a compound P binds X to form PX, then $y = [PX]/[P_{total}]$. A plot of y against $[X]$ is known as the **adsorption isotherm** for this system.

saturation kinetics the kinetics of a reaction (or of **mediated transport**) when the velocity of the reaction (or of the transport) increases to a maximal value (plateau) as the concentration of the reactant (or of a component being transported) is increased.

saturation ratio or **cooperativity index** *symbol:* R_0 ; (of an allosteric protein) the ratio of the concentration of the substrate (or other small molecule) necessary to produce 90% to that required to produce 10% saturation of the specific sites on a protein. It is a convenient measure of the extent of cooperativity. *See also* **cooperative ligand binding**.

saxiphilin a protein, derived from the bullfrog, that is related to transferrin and binds saxitoxin with great affinity.

saxitoxin *abbr.:* STX; a paralytic poison, produced by the marine dinoflagellates *Gonyaulax catenella* and *G. excavata*. It can be accumulated by shellfish, making them toxic when eaten. Its action is similar to that of **tetrodotoxin**, with which it competes for sodium channels.

Sb *symbol for* antimony.

SBH *abbr.* for sequencing by hybridization; a hypothetical method yet to be implemented for the very rapid sequencing of DNA. It is based on the idea of having all possible octamers (there are 63536) on a small hybridization screen called a DNA chip. As the octamers form nested arrays, a DNA fragment (of a few hundred bases) would only hybridize to some of these and the sequence could be deduced computationally.

SBP2 *abbr.* for SECIS-binding protein 2; a mammalian protein (\approx 94 kDa) that binds the selenocysteine insertion sequence (**SECIS**) of mRNA for selenoproteins and is required for selenocysteine insertion into the latter. It binds through a 32-amino acid sequence that it shares with several ribosomal proteins. SBP2 also binds the mRNA at a region 5' to the SecUDA codon. *See also* **Self**.

SBS model or **SBS** *abbr.* for side-by-side model.

sc *abbr.* for synclinal (def. 2).

s.c. *abbr.* for subcutaneous.

Sc 1 *symbol for* scandium. **2** *abbr.* for secretory component (*see* **secretory piece**).

SCAD *abbr.* for short-chain acyl-CoA dehydrogenase or butyryl-CoA dehydrogenase; *see* **beta-oxidation system**.

SCAF *abbr.* for SR-like CTD-associated factor; *other name:* CTD-associated SR-like protein (*abbr.:* CASP); any protein that is homologous with splicing regulatory (SR) proteins and binds to the C-terminal domain (CTD) of the largest subunit of RNA polymerase II. *See* **SR protein**.

scaffold (*in gene sequencing*) an ordered set of **contigs** that are in the right order but do not necessarily form a contiguous stretch of sequence.

scaffold attachment factor *abbr.:* SAF; either of two nuclear proteins (SAF-A and SAF-B) of humans that bind AT-rich chromosomal regions termed scaffold attachment regions. They bind DNA through an N-terminal **SAP domain**. SAF-A also binds ATP and is a target for cleavage by caspase during apoptosis. SAF-B (or SAF-145) also contains a conserved domain seen in proteins involved in splicing of pre-mRNA.

scaffolding protein any of a group of proteins that have specific binding sites for, and are instrumental in determining the structure and assembly of, large 3-D structures, such as viruses. Such proteins are integral to the **self-assembly doctrine** elaborated by Caspar and Klug.

scalar 1 a physical quantity, such as mass or time, that is characterized only by its magnitude and does not contain any concept of di-

rection. **2** describable by a number representing a point on a scale undirected in space. *Compare* **tensor**, **vector** (def. 1).

scaler an electronic circuit or device that counts electrical pulses by aggregating the pulses and giving one output pulse for a predetermined number of input pulses.

scaloped the DNA-binding component of the selector complex for wing formation in *Drosophila*.

SCAM *abbr. for* substitute cysteine accessibility method; a method used in studying integral membrane proteins, in which specific amino acids are mutated to cysteine and their accessibility is then tested by thiol-reacting chemicals.

SCAMP *abbr. for* secretory carrier membrane protein; a Ca²⁺-binding protein with leucine zipper and zinc finger. SCAMPs are components of post-Golgi membranes, and function in recycling proteins between the Golgi and the cell surface.

scanner an instrument or device used to measure or sample the distribution of some quantity or condition in a particular system, area, or region, e.g. to measure the distribution of colour or radioactivity on a chromatogram or electrophoretogram, or to measure the radial distribution of light absorbance in a cell in an ultracentrifuge.

scanning electron microscope *abbr.:* SEM; *see* **electron microscope**.

scanning proton microprobe an instrument in which a sample is bombarded by a high-energy (1–4 MeV) proton beam, causing emission of X-rays that can be characteristically attributed to certain elements. The technique permits the detection of elements down to about 1 ppm.

SCAP *abbr. for* SREBP-cleavage activating protein; a membrane protein of the endoplasmic reticulum and Golgi apparatus that regulates cleavage and release of the transcriptional domain of **SREBP** by **S1P** and **S2P** acting in sequence. It consists of N-terminal transmembrane segments (of which five constitute a sterol-sensing domain), and a cytoplasmic C-terminal region that contains five **WD40** repeats and interacts with the regulatory domain of SREBP. Cholesterol and polyunsaturated fatty acids, acting via the sterol-sensing domain, inhibit cleavage of SREBP and release of its transcriptional domain.

Scatchard plot a method of analysis of the binding of ligand to a macromolecule (or receptor), based on the **Scatchard equation**, $\bar{v}/[L] = (n - \bar{v})/K$, where \bar{v} is the average number of ligand molecules bound per binding macromolecule, $[L]$ is the free ligand concentration, n is the number of binding sites on the macromolecule and K is the intrinsic association constant. A plot is made of $\bar{v}/[L]$ on the y -axis and \bar{v} on the x -axis. If the binding sites are identical and independent, a straight line is obtained of slope $-K$ with intercepts on the x -axis of n and on the y -axis of Kn . If there is interaction between the binding sites, or there are several classes of independent sites, the plot is not linear. [After George Scatchard (1892–1973), US physical chemist.]

scatter to disperse in random direction(s) by impact or other interaction, especially light, electrons, neutrons, or X-rays. The measurement of scattered rays or particles may lead to useful analysis, as in **light scattering**.

scatter diagram a graph upon which two measured characteristics of each individual of a population are represented by one dot.

scatter factor *an alternative name for* **hepatocyte growth factor**.

scavenger (*in chemistry*) a substance that reacts with or binds a trace component, such as a trace metal ion, or that traps a reactive reaction intermediate.

Sec *abbr. for* separate cysteine cleaved; any of a small family of proteins that are cleaved by **separases**. Sec1 and Sec3 are components of the **cohesin** complex.

SCF *abbr. for* stem cell factor.

Schardinger dextrin *an alternative name for* **cyclodextrin**. [After Franz Schardinger (1853–1920), who first described such compounds in 1908.]

Schardinger enzyme *an alternative name for* **xanthine oxidase**.

Schardinger reaction the decolorization of methylene blue by milk in the presence of formaldehyde; the reaction is catalysed by **xanthine oxidase** (or Schardinger enzyme) in the milk.

Scheie syndrome *an alternative name for* **mucopolysaccharidosis I S**. [After Harold G. Scheie (1909–1990).]

schema *pl. schemata* (*in informatics*) **1** a specification or description of the types of data represented in a database, the attributes they possess, and the relationships between them. **2** a diagram representing this specification.

Schiff base or **Schiff's base** any **imine** having the more limited general structure R₂C=NR' where R may be any organyl group or H and R' is any organyl group. It may be formed by condensation of the carbonyl group of an aldehyde or ketone with the amino group of a primary amine according to the equation:

Often considered to be synonymous with **azomethine**. [After Hugo Schiff (1834–1915), German chemist.]

Schiff reagent a solution of leucofuchsin – fuchsin bleached with sulfurous acid – that produces a red colour when reacted with an aldehyde. The reagent is used in the **Feulgen reaction** and the **periodic acid–Schiff reaction**.

Schiff test 1 (for aldehydes) a test based on the red colour produced when aldehydes react with **Schiff reagent**. **2** (for uric acid) a test based on the reduction of silver ions (silver nitrate solution) to metallic silver by uric acid in sodium carbonate solution. **3** (for urea) a test based on the formation of a purple colour when urea is treated with a concentrated solution of furfural in concentrated hydrochloric acid solution. Allantoin, but not uric acid, also gives a positive test.

Schild equation the expected relationship between the **concentration ratio**, r , and the concentration of a reversible competitive antagonist, B. It is given by $r = [B]/K_B + 1$, where K_B is the dissociation equilibrium constant for the combination of B with the receptor. *Compare* **Gaddum equation**. [After Heinz Otto Schild (1906–84), Austrian-born British pharmacologist.]

Schild plot a plot of log (**concentration ratio** – 1) versus log concentration of antagonist. For a reversible competitive antagonist the plot has a gradient of 1. The intercept on the abscissa then defines the concentration of antagonist required to reduce the response of the target tissue (or organism) by half (the dissociation equilibrium constant: $-\log K_B = pA_2$ when the slope is exactly unity and there are no complicating factors; *see* pA_2).

Schilling test a test for cobalamin (vitamin B₁₂) malabsorption that depends on the oral administration of ⁵⁷Co- or ⁵⁸Co-labelled **cyanocobalamin** and measurement of the urinary excretion of the radioactive label during the ensuing 24 hours. [After Robert Frederick Schilling (1919–), US hematologist and nutritionist.]

Schindler disease *see* **α -N-acetylgalactosaminidase deficiency**.

schizencephaly a rare disorder of human brain development that produces seizures, mental retardation, and blindness or speech defects. One or both cerebral hemispheres contain a full-thickness cleft and missing portions. It results from mutation in the homeo-domain protein **EMX2**. —**schizencephalic** *adj.*

schizogeny (*in botany*) the separation of cells that occurs when new structures (e.g. aerenchyma or oil glands) are differentiating.

schizolysigeny (*in botany*) a combination of **schizogeny** and **lysisigeny**.

schizophrenia any mental disorder characterized by a special type of personality disintegration, random thought processes, and impaired relation to reality. Antipsychotic (neuroleptic) drugs such as **chlorpromazine**, widely used in the symptomatic treatment of all forms of schizophrenia, are considered to act by blocking post-synaptic dopamine D₂ receptors, though most are not totally selective in this action. —**schizophrenic** *adj.*, *n.*

Schizosaccharomyces pombe the fission yeast that is used to brew the African beer called *pombe*. The rod-shaped cells grow by elongation, and the spores germinate and divide as haploids. The membranous organelles, e.g. the Golgi apparatus, are closely similar to those of higher eukaryotes, in marked contrast to those of budding yeast. It is suitable for analysing the relationship between cell size and the cell cycle because: (1) the cells divide symmetrically, unlike budding yeast; and (2) the yeast grows in length but not in diameter.

Schlesinger test a qualitative test for **urobilin** in urine. The urobilinogen in the urine is first oxidized by iodine to urobilin, then a zinc–urobilin complex is formed by addition of zinc acetate in ethanol; the complex has a yellow-green fluorescence and an absorption band at 507 nm.

Schlieren method an optical method of exhibiting inhomogeneities in refractive index in transparent media, dependent on the deflection of a ray of light from its undisturbed path when it passes through a medium in which there is a solute inducing a gradient of refractive index normal to the ray. The curvature of the ray is proportional to the refractive-index gradient in the direction normal to the ray. It is used in biochemistry particularly in measurements of diffusion, sedimentation, and electrophoretic mobility of proteins and other substances. [From German *Schliere*, streak.]

Schmidt-Thannhauser procedure a method for the extraction and determination of DNA, RNA, and phosphoproteins. Material insoluble in dilute, cold trichloroacetic acid is dried, digested with alkali, and subsequently precipitated with a strong acid. The total phosphorus in the precipitate represents DNA, the soluble inorganic phosphorus represents the phosphoproteins, and the soluble organic phosphorus represents the RNA. [After Gerhard Schmidt (1901–81) and Siegfried Joseph Thannhauser (1885–1962), German-born US biochemist.]

Schultz-Dale reaction an *in vitro* anaphylactic reaction in which the uterus or ileum of a sensitized animal (guinea pig) contracts specifically when a small amount of the sensitizing antigen is added to the bathing medium. The reaction is caused by histamine and similar substances that are released when the antigen combines with cellular antibody. [After H. H. Dale.]

Schütz-Borrisow rule or **Schütz law** an empirical rule according to which the velocity of an enzyme reaction is proportional to the square root of the enzyme concentration. It was first developed for pepsin but applies only to the crude enzyme under certain limited conditions; similar results have been obtained with some other proteases. The effect is due to the presence of a reversibly dissociating pepsin inhibitor in crude pepsin preparations.

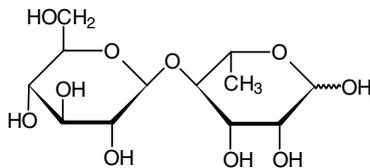

Schwann cell a unipolar cell of the **neurilemma** surrounding a myelinated neuronal axon that is responsible for the formation and maintenance of the **myelin sheath** in peripheral myelinated neurons. [After Theodor Schwann (1810–82), German anatomist and physiologist.]

Schwannomin *see* **merlin**.

SCID *abbr.* for severe combined immunodeficiency; a heterogeneous group of primary immunodeficiency disorders that result from profound functional impairment of B and T lymphocytes. It presents with severe or repeated infections (especially by opportunistic microorganisms). About 50–60% of patients are boys, the disorder being X-linked and caused by numerous mutations in the gene for interleukin 2 receptor γ chain (IL-2R γ) at Xp13.1 (*see* **interleukin 2**). Autosomal recessive forms are due to deficiency of adenosine deaminase, purine nucleoside phosphorylase, JAK3, IL-7R α , RAG1, RAG2, ZAP-70, or Lck. *See* **adenosine deaminase deficiency**.

SCIF *abbr.* for secondary cytotoxic T-cell-inducing factor (i.e. **interleukin 2**).

scillabiose the disaccharide 4-O- β -D-glucopyranosyl-L-rhamnose, found in a **glycoside** of *Scilla maritima*.

scinderin or **adseverin** a Ca²⁺-dependent cytosolic actin filament-severing protein present in chromaffin cells, platelets, and a variety of secretory cells.

scintillant 1 (of a phosphor) exhibiting scintillation. **2** a jargon term for **scintillator**.

scintillate 1 to give off sparks, to sparkle. **2** (of a phosphor) to emit quanta of light discontinuously, by fluorescence, when struck by a charged particle or a high-energy photon.

scintillation 1 the act of scintillating. **2** the flash of light produced in a phosphor when it is struck by a charged particle or a high-energy photon.

scintillation autoradiography an alternative term for **fluorography** (def. 2).

scintillation cocktail or **scintillation fluid** any mixture, containing a **scintillator**, to which **beta emitters** can be added for the purpose of **scintillation counting**; the radiation excites the scintillator to emit light. Many scintillation cocktails are based on hydrophobic solvents, since for the most part scintillators sparingly soluble in aqueous solutions have been used. The first scintillator to be widely used was 2,5-diphenyloxazole (PPO), often with 1,4-bis(5-phenyl-2-oxazolyl)benzene (PoPoP), which is excited by the light emitted by PPO to emit light of a higher wavelength more suitable for measurement. Many other scintillators, especially biodegradable compounds and others more compatible with water, have been developed. *See also* **biphenylphenyloxadiazole**, **bismethylstyrylbenzene**.

scintillation counter an instrument for the detection and measurement of the intensity of high-energy radiation. Instruments for detecting gamma radiation contain a detector, normally a crystal of sodium iodide containing a small amount of thallium, and this is encased in a metal 'top hat' lined with a white reflector, the open end being sealed with Perspex. When the sodium iodide absorbs γ rays it emits a flash of light. For the counting of β^- emissions, the radioactive substance is dissolved or suspended in a **scintillation cocktail** contained in a glass or plastic vial, which is inserted into a chamber in the counter. Sometimes a solid scintillant is used for this also, e.g. for the effluent from chromatography columns. In the case of both types of instrument, the flashes of light produced are detected by a photomultiplier and converted into pulses of electric current which may be counted by an electronic counter.

scintillation fluid an alternative term for **scintillation cocktail**.

scintillation spectrometer another name for **scintillation counter**.

scintillator or **scintillant** any phosphor that fluoresces when struck by a charged particle or a high-energy photon. *See* **scintillation cocktail**.

scintillon a subcellular, crystal-like structure, found in bioluminescent organisms, that emits light on acidification in the presence of oxygen.

scissile capable of being split easily or cut smoothly, especially of an easily cleaved chemical bond.

scission a division or splitting; an act of dividing a nonisometric object orthogonally to its longest axis, especially a chemical bond or a fibrous molecule; **cleavage** (def. 2).

scleral pertaining to the sclera, the fibrous outer layer of the eyeball.

scleroderma or **systemic sclerosis** a chronic autoimmune disease in which skin, subcutaneous tissues, and various internal organs accumulate several types of collagen in the extracellular matrix. Autoantibodies to nuclear antigens are present in the serum.

scleroprotein any of a group of simple, generally fibrous, proteins that are insoluble in aqueous solutions; examples include **keratin** and silk **fibroin**.

sclerosis hardening of a tissue as a sequel to inflammation; especially an increase of connective tissue in the nervous system. *See also* **arteriosclerosis**. —**sclerotic** *adj.*

SCOP *abbr.* for structural classification of proteins; *see* **structure classification database**.

scopolamine *see* **hyoscyne**.

scorbatic of, pertaining to, or affected with **scurvy**.

scoring matrix or **weight matrix** (*in sequence analysis*) a table of all possible pairwise relationships between nucleotide or amino acid symbols, used by database search and sequence alignment programs to quantify the similarity between sequences. The simplest scoring matrix is an identity or unitary matrix, in which only pairwise identities receive a positive score (nonidentical characters receive zero score). *Compare* **substitution matrix**.

scotophobin a 15-residue peptide that accumulates in the brains of rats trained to avoid the dark; administration is said to elicit a similar response in untrained animals. It is thought to be the first memory-directing substance isolated and identified.

scotopia adaptation to darkness; the adjustment of the eye to vision in dim light or the dark. It is considered to involve mainly retinal **rod cells**. *Compare* **photopia**. —**scotopic** *adj.*

scotopsin an **opsin** that is the apoprotein of a **rhodopsin**.

SCP *abbr.* for **1** single-cell protein. **2** sterol carrier protein.

SCP2 *abbr.* for sterol carrier protein 2.

SCPx or **SCP2/3-ketothiolase** a protein (547 amino acids) of the peroxisomal matrix that is processed therein into 3-ketothiolase (residues 1–404) and to **sterol carrier protein 2** (SCP2; the remaining residues). It is essential for beta oxidation of pristanic acid by catalysing the final step.

scrambalase a membrane protein that acts as a procoagulant by prompting Ca^{2+} -dependent migration of phosphatidylserine across the membrane bilayer of activated platelets. A defect in the protein may be associated with a bleeding disorder.

scrapie a **spongiform encephalopathy** of sheep and goats, and the first to be identified of a group once thought to be 'slow virus' infections occurring naturally and caused by an unconventional agent. Scrapie has similarities to two other animal diseases, transmissible mink encephalopathy and **bovine spongiform encephalopathy**, and three transmissible human dementias, **kuru**, **Creutzfeldt–Jakob disease**, and **Gerstmann–Sträussler syndrome**. All these diseases are now accepted as being caused by alterations in the **prion proteins** in the nervous system. The disease has been known since its first reported occurrence in merino sheep in Spain in 1732, which was rapidly followed by reports of other cases in Britain and Germany. The incubation period for the scrapie agent is usually 1–3 years. Different breeds of sheep exhibit markedly different susceptibilities to scrapie. As many as 20 different strains of scrapie agent, each with distinct properties in terms of incubation period in a given host and location of damage within the brain have been identified and transferred to mice. It would appear that the strains are passed to the progeny, so any explanation of the nature of the infective agent and process must take this into account.

screen 1 to protect from; esp. from harmful agents or radioactivity using sheets of lead, glass, or plastic; or from radiofrequency interference using a copper sheath or wire net. **2** to sift data, often using a limited or general assay, for selection of a particular phenomenon or result; samples selected by preliminary screening can be isolated for more detailed study. **3** (*in clinical chemistry*) to carry out any diagnostic procedure on a large cohort of patients with a view to detecting hitherto asymptomatic disease; *see also* **genetic screening**. **4** any device or material that acts to screen.

screw axis a crystal or an oligomeric protein molecule is said to possess an *n*-fold screw axis if it presents exactly the same appearance after rotation about that axis of $360^\circ/n$, coupled with a translation parallel to the axis. *Compare* **rotation axis**.

scRNA *abbr.* for small cytoplasmic RNA.

scRNP *abbr.* for small cytoplasmic ribonucleoprotein.

SCU *abbr.* for synonymous codon usage.

scurfin an alternative name for **FOXP3**

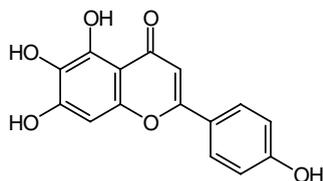

scurfy an X-linked disease of mice caused by mutations in **FOXP3** and resulting in a multiorgan autoimmune and inflammatory syndrome.

scurvy avitaminosis C; a deficiency disease caused by lack of **ascorbic acid** (vitamin C) in the diet. It is characterized by anemia, sponginess and ulceration of the gums, hemorrhages into the skin and subcutaneous tissues, and delayed wound healing.

scute a gene in *Drosophila* for **AS-C protein**.

scutellarin EC 3.4.21.60; *other name*: taipan activator (being from the venom of the taipan (snake), *Oxyuramus scutellatus*). An enzyme that catalyses (like factor Xa of blood coagulation) the cleavage of Arg-[\cdot]Thr and Arg-[\cdot]Ile in prothrombin to form **thrombin** and two inactive fragments. *Compare* **scutellarein**.

scutellarein 4',5,6,7-tetrahydroxyflavone; the aglycon of **scutellarin**. *Compare* **scutellarin**.

scutellarin the glucuronide of **scutellarein**, from *Scutellaria* spp. *Compare* **scutellarin**.

scryp colloquialism for scRNP (i.e. **small cytoplasmic ribonucleoprotein**).

SD *abbr.* for standard deviation.

SDS *abbr.* for sodium dodecyl sulfate.

SD sequence *abbr.* for Shine–Dalgarno sequence.

SDS-PAGE *abbr.* for SDS–polyacrylamide gel electrophoresis.

SDS–polyacrylamide gel electrophoresis or **SDS gel electrophoresis** or **detergent gel electrophoresis** *abbr.*: SDS–PAGE; a rapid method for resolving a protein into its subunits and determining their relative molecular masses, based on the ability of **sodium dodecyl sulfate** to cause dissociation of oligomeric proteins and to bind to the subunits to form complexes of constant charge-to-mass ratio. On **zone electrophoresis** in polyacrylamide gel, such complexes often have mobilities directly related to their M_r values, which may thus be obtained by comparison with standards.

Se *symbol* for selenium.

SE *abbr.* for standard error; *see* **standard error of estimate of the mean**.

SEA a family of genes for membrane receptor tyrosine kinases homologous with the **insulin receptor** family. The acutely transforming virus, avian erythroblastosis virus (*abbr.*: AEV) strain 13, contains the oncogene *v-sea*; this transforms fibroblasts and erythroblasts, but not avian myeloid cells. Sea, the product of *c-sea*, the cellular homologue of *v-sea*, phosphorylates Shc (*see* **SHC**) on tyrosine residues.

sealase a former name for DNA ligase (ATP); *see* **DNA ligase**.

search engines Internet sites that have facilities for text searching. Depending on the way they work they are variously referred to as Web crawlers, spiders, robots, etc. For general purposes the search engine <http://www.google.com> or one of its mirrors such as <http://www.google.co.uk> is an excellent starting point.

sea-urchin-hatching proteinase *see* **envelysin**.

sebaceous gland any of the single or branched glands in the skin that secrete **sebum** into the hair follicles.

sebum the oily secretion of the sebaceous glands in the skin. It contains lipids such as waxes, squalene, and triacylglycerols; the triacylglycerols are broken down by anaerobic bacteria during secretion to form fatty acids. Sebum helps to form an effective barrier against water loss.

sec *symbol* for secant (def. 1).

sec. *abbr.* and *obsolete symbol* for **second** (def. 1).

sec- *abbr.*: *s-*; *prefix* (*in chemical nomenclature*) signifying **secondary** (def. 1a).

Sec *symbol* for a residue of the α -amino acid L-selenocysteine.

secant 1 *abbr.* and *symbol*: sec; the reciprocal of the **cosine** of an angle. **2** a straight line cutting a curve at two or more points.

SECIS *abbr.* for selenocysteine insertion sequence; a putative stem-loop nucleotide sequence required for decoding the SecUGA codon of eukaryotic mRNA for selenoproteins. It is located in the 3' untranslated region of the mRNA that binds **SBP2** and **SeIb**

seco- *prefix* (*in chemical nomenclature*) denoting cleavage of a ring with addition of one or more hydrogen atoms at each terminal group thus created. The numbering of the skeletal atoms of the parent molecule is retained.

seco-carotenoid a **carotenoid** in which a ring has been opened by breakage of a carbon–carbon bond; e.g. semi- β -carotene (5,6-seco- β - β -carotene-5,6-dione).

second 1 *symbol*: s; the SI base unit of time, equal to the duration of 9 192 631 770 periods of the radiation corresponding to the transition between the two hyperfine levels of the ground state of the caesium-133 atom. **2** *symbol*: " a unit of plane angle equal to 1/60 of a minute; i.e. 4.84814 microradian ($\pi/648000$ rad). *See* **angle** (def. 1).

secondary (*in chemistry*) **1 a** *prefix*: *sec-* (*abbr.*: *s-*); describing an alkyl compound (e.g. an alcohol) in which the functional group (e.g. a hydroxyl group) is attached to a carbon atom linked to two others. **b** describing the carbon atom bearing the functional group in such a compound. **2** describing an amide or amine in which two appropriate groups are attached to a nitrogen atom. **3** describing a salt formed by replacing two of the ionizable hydrogen atoms of a tribasic acid by one or two other cations of appropriate valency. *Compare* **primary**, **tertiary**.

secondary bond any of the weak attractive forces between atoms and/or molecules, especially when these stabilize a three-dimensional structure. It includes **hydrogen bonds**, **hydrophobic interactions**, and **van der Waals forces**.

secondary cell wall (*in plants*) the microfibrils and noncellulosic polysaccharides deposited on the primary cell wall. It provides additional conducting and supporting tissue and often makes up the greater part of the mature cell wall.

secondary charge effect an effect seen in the hydrodynamic study of charged macromolecules when the positive and negative ions of the supporting electrolyte have different sedimentation (or diffusion) coefficients, leading to the establishment of local electric fields due to charge separation. These local fields act as an additional force on the macromolecules, either accelerating or retarding their movement.

secondary cytotoxic T cell-inducing factor *abbr.*: SCIF; *an alternative name for interleukin 2*.

secondary database *an alternative name for pattern database*.

secondary deficiency a nutritional deficiency occurring when the dietary content of some essential nutrient is known to be adequate in normal conditions. It may be caused by malabsorption from the gut due to disease, diminished synthesis of a vitamin by the intestinal flora during treatment with an antibacterial agent, or increased requirement, e.g. in pregnancy.

secondary electron an electron emitted from a solid as a result of the impact of another electron. If the energy of the incident primary electron is sufficient, more than one secondary electron may be emitted, an effect exploited in an **electron multiplier**. *See also photo-multiplier*.

secondary emission the emission of **secondary electrons**.

secondary F'-containing strain *see F plasmid*.

secondary fluor a second fluorescent agent that absorbs the fluorescent light emitted by a **primary fluor** and is thus excited to emit light at a higher wavelength, which may be more convenient for detection.

secondary hyperlipidemia *see hyperlipidemia*.

secondary immune response a response to an **immunogen** to which an animal has previously been exposed. It is characterized by the rapid production of large amounts of **antibody** over a few days, followed by an exponential decline. *Compare primary immune response*.

secondary lysosome or **phagolysosome** a **lysosome** that results from fusion of a **primary lysosome** with a **phagosome** or a vesicle containing endocytosed matter. *Compare telolysosome*.

secondary messenger *a variant form of second messenger*.

secondary metabolism the formation of end products of metabolism – **secondary metabolites** – that often have no readily apparent use in the producing organism.

secondary metabolite any of a group of very diverse natural products that have a restricted taxonomic distribution, usually possess no obvious function in cell growth, and are often synthesized by cells that have stopped dividing; they usually belong to closely related chemical families, usually of $M_r < 1500$, but some bacterial toxins are considerably larger. An example of a secondary metabolite is penicillin.

secondary response *see secondary immune response*.

secondary structure 1 (*of a protein*) the arrangement of the polypeptide primary structure into locally-organised, hydrogen-bonded structures, in particular α -helices and β -sheets; *see alpha helix, beta sheet*. **2** (*of a nucleic acid*) the arrangement of one or two polynucleotide chains in bihelical structures, stabilized by hydrogen bonds between complementary bases (*see complementary base sequence*); *compare clover-leaf structure*. *See also primary structure, quaternary structure, tertiary structure*.

second law of thermodynamics *see thermodynamics*.

second messenger or **secondary messenger** a mediator that is caused to accumulate in an effector (target) cell by the action of a **hormone**, **growth factor**, or other agonist, and that brings about the action of that agonist on the cell. The major second messenger systems include: synthesis of cyclic AMP by **adenylate cyclase** (the first of such systems to be discovered); synthesis of cyclic GMP by **guanylate cyclase**; opening of **ion channels**; the phosphoinositide sys-

tem, (*see phosphatidylinositol cycle*) involving activation of phosphoinositide-specific phospholipase C (*see phospholipase*), or **1-phosphatidylinositol 3-kinase**; the release of ceramide from sphingolipids by sphingomyelinase; and protein phosphorylation by serine/threonine-specific or tyrosine-specific **protein kinases**. An important component in several of these involves coupling of activated receptor to the effector system through a **G-protein**.

second-order rate constant *see rate constant*.

second-order reaction *see order of reaction*.

second-steroid a **steroid** in which a ring has been opened by breakage of a carbon-carbon bond.

secretagogue or **secretogogue** an agent that stimulates secretion (usually of a hormone, juice, or other glandular product). *See also +agogue*.

secretase an enzyme that cleaves the extracellular domain of type I or II transmembrane proteins, releasing that part of the protein into the circulation. Cleavage normally occurs near the extracellular face of the membrane. Substrates for secretases include Alzheimer's amyloid precursor protein (APP), angiotensin-converting enzyme, transforming growth factor- α , and the tumour necrosis factor ligand and receptor superfamilies. α -Secretase is a zinc-dependent protease; β -secretase (*also called memapsin 2*; BACE2) is a type I transmembrane protein with an aspartyl protease domain; γ -secretase requires senilins for activity and cleaves the transmembrane segment of APP. All three cleave APP but only β - and γ -secretases are required for release of β -amyloid peptide.

α -secretase *see ADAM-10*.

secrete to elaborate and emit a **secretion** from a cell or, particularly, from a gland.

secretin an intestinal hormone, discovered in 1902 by William Maddock Bayliss (1860–1924, British biologist) and Ernest Henry Starling (1866–1927, British physiologist) (the first hormone to be discovered). It has the sequence (human):

(3.04 kDa), and is formed from a precursor synthesized in the S cells of the small intestinal mucosa. It stimulates the release of bicarbonate, enzymes, and potassium ions from the pancreas and stimulates the secretion of enzymes and electrolytes in the gut; it also inhibits HCl production by the stomach. Secretin lends its name to a superfamily that includes **gastric inhibitory peptide**, **GHRH**, **glucagon**, **peptide HI**, and **vasoactive intestinal polypeptide**.

secretin receptor any G-protein-associated membrane receptor that binds **secretin** and mediates its intracellular effects by activating adenylate cyclase. Secretin receptors are not structurally related to other G-protein-coupled receptors.

secretion 1 the process of elaborating, segregating, and emitting a substance or juice from a cell, organ, or organism; e.g. insulin by the B cells of the islets of Langerhans, or urine by the kidneys. There are three basic types of secretion: **apocrine**, **holocrine**, and **merocrine**. **2** a product of **secretion** (def. 1) from a cell, organ, or organism.

secretogogue *a variant spelling of secretagogue*.

secretogranin I *another name for chromogranin B (see chromogranin)*.

secretor any person who secretes water-soluble glycoproteins with A, B, or H blood-group specificities into their mucous secretions, e.g. saliva and gastric juices. Over 80% of humans are secretors, having a **secretor gene** in their genomes.

secretor gene a gene determining **secretor** phenotype in humans. Secretor status is determined by a pair of allelic genes, *Se* and *se*. Secretors are either *Se/Se* or *Se/se* while nonsecretors are *se/se*. These alleles occur at a different locus from the ABO locus and do not affect the A, B, and H specificities of the red blood cells.

secretory describing a molecule or molecular fragment destined for secretion from a cell, such as secretory protein, polypeptide, etc.

secretory actin-binding protein *abbr.*: SABP; *also called* prolactin-inducible protein; gross cystic disease fluid protein 15; a glycoprotein that has been isolated in several different studies (as the alternative names indicate), but whose function remains unknown. As the prolactin-inducible protein, it was identified as a highly specific and sensitive marker of primary and metastatic breast cancer.

secretory component *another name for secretory piece.*

secretory granule a membrane-bound subcellular vesicle that is formed from the Golgi apparatus and contains a protein destined for secretion. The membrane of the granule fuses with the plasma membrane, and its protein load is exteriorized. Processing of the contained protein may take place in secretory granules. *Compare zymogen granule.*

secretory piece (*abbr.*: SP) or **secretory component** (*abbr.*: Sc) the 58 kDa polypeptide that joins the two identical monomers comprising the secretory form of **immunoglobulin A**. It has strong affinity for mucus, thus prolonging retention of IgA on mucous surfaces, and may protect the IgA against proteolytic destruction in the digestive tract. *Other names*: T chain; transport piece.

secretory protein I *abbr.*: SP-I; a glycoprotein of the parathyroid gland that is co-secreted *in vitro* with **parathyrin**. It consists of at least two homologous glycoproteins of similar size (M_r 72 000 and 70 000), related to chromogranin A (*see chromogranin*).

sector any portion of a circle bounded by two radii and the included arc. —*sectoral adj.*

sector cell or **sector-shaped cell** a cell used in an analytical ultracentrifuge to contain the sample. It is sector-shaped when viewed parallel to the rotation axis. Since the accelerating force is radial, sedimenting molecules move along radii and this cell shape minimizes the collision of sedimenting molecules with the cell walls.

securin a protein that binds to the N- and C-terminal regions of **separase** and inhibits its protease activity. Mutations in the securin gene are associated with defects in the separation of sister chromatids during anaphase of cell division.

sediment 1 to undergo **sedimentation**. **2** the accumulation of material resulting from sedimentation.

sedimentation the setting of solid particles (or solute) through a liquid (or solution) under the influence of a gravitational or centrifugal field.

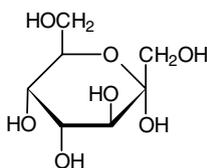

sedimentation coefficient symbol: *s*; the rate of sedimentation of a particle in an ultracentrifuge or other system. For a particle or solute sedimenting in a system at constant applied field, temperature, and pressure, $s = v/a$, where *a* is the acceleration of free fall or centrifugation and *v* is the velocity of sedimentation. In centrifugation $s = v/\omega^2 r$, where ω is the angular velocity in rad s^{-1} and *r* is the distance of the particle or solute from the axis of rotation. It has the dimensions of time. The sedimentation coefficients of macromolecules and cellular particles are often expressed in **svedbergs**.

sedimentation equilibrium a technique in which compounds of interest are centrifuged for a period sufficiently long for the system to come to equilibrium. The technique has a number of applications. In one, used for molecules that have a density greater than the solvent, centrifugation is carried out at relatively slow speeds so that sedimentation of the molecule is slow enough to be counterbalanced by diffusion. At equilibrium, the concentration is lower at the meniscus and higher at the bottom of the cell, but is unchanging. The relative molecular mass, M_r , of the compound in question, often a protein, can be calculated from the expression:

$$m_r = 2RT \ln(c_2/c_1) / \omega^2 (1 - \nu\rho)(r_2^2 - r_1^2),$$

where *R* is the gas constant, *T* is the thermodynamic temperature, ν is the specific volume of the component, ρ is the density of the solution, ω is the angular velocity of the rotor, and c_1 and c_2 are the concentrations of the component at distances r_1 and r_2 from the centre of rotation. Ideally, determinations should be done at several concentrations and extrapolated to zero concentration.

sedoheptulose a *nonsystematic name for* D-altrio-2-heptulose.

α -D-pyranose form

sedoheptulose-bisphosphatase EC 3.1.3.37; a chloroplast enzyme of the **reductive pentose phosphate cycle** that catalyses the reaction:

sedoheptulose 7-phosphate the 7-phosphate ester of **sedoheptulose**; it is a component of the **pentose phosphate pathway**.

SEE1 a cysteine protease (360 amino acids) of senescing leaves of maize. It is homologous to aleurain (of barley) and γ -oryzain (of rice).

Seebeck effect the phenomenon whereby an electromotive force is generated in a circuit containing junctions between dissimilar metals if these junctions are not all at the same temperature. *See thermocouple*. *Compare Peltier effect*. [After Thomas Johann Seebeck (1770–1831), Estonian-born German physicist.]

SEG *see sequence filter*.

Segawa syndrome *an alternative name for dopamine-responsive dystonia*.

segmentation 1 (of an ovum) *see cleavage* (def. 3). **2** (of an animal's body) *see metamerism*.

segmentation genes any of the 15 genes that are active during early development of *Drosophila* whose products are involved in dividing the embryo into a series of segments. There are three categories: segment polarity genes; pair-rule genes; and gap genes.

segment polarity gene any of the 16 or so genes in *Drosophila* that define the anterior and posterior compartments of segments. Examples are *engrailed*, *wingless*, and *hedgehog*.

segregation (*in genetics*) **1** the separation of homologous genetic elements (i.e. allele pairs) during meiosis in diploid cells. **2** the separation of sister chromatids during mitosis; by extension, the separation of any two independent genetic elements during cell division in prokaryotes. **3** (of plasmids) the partitioning of plasmids into daughter cells at cell division. Naturally occurring plasmids contain a partitioning function, *par*, which ensures correct partitioning into the two daughter cells.

segresome a membrane-bound, cytoplasmic aggregate of a dye, formed either by passage of the dye into a pre-existing **phagosome** or **lysosome**, or by the *de novo* formation of a membrane around the dye aggregate.

Seitz filter a filtration apparatus that removes microorganisms from a liquid. It formerly consisted of a flat pad of asbestos, or asbestos and cellulose, suitably mounted between the sample container and the receiving flask, filtration being assisted by reducing the pressure in the receiving flask. It has now been superseded by a sintered-glass filter. [After Seitz-Filter-Werke, T. and G. Seitz GmbH & Co., Bad Kreuznach, Germany.]

selachyl alcohol 3-(octadec-9-enyloxy)-1,2-propanediol; a 1-octadec-9-enyl ether of glycerol, and a hydrolysis product of **ether lipids**.

SelB or **eEFsec** a specific eukaryotic elongation factor that conveys selenocysteine tRNA (Sec-tRNA^{Sec}) to the ribosome and binds the selenocysteine insertion sequence (**SECIS**) of the mRNA for a selenoprotein. Mouse SelB (583 amino acids) contains four GTP-binding sites in the N-terminal portion, which also binds the tRNA. It functions with **SBP2**. In eubacteria SelB and SBP2 form part of a bifunctional protein.

SELDI *abbr. for* surface-enhanced laser desorption and ionization; a commercial mass spectrometry technique for capturing peptides and proteins on an affinity surface (either chemical or biological) and subsequently quantifying and identifying the proteins. *See also tandem mass spectrometry*.

selectable marker a gene whose expression confers selective advantage on a cell or organism when exposed to an antibiotic. The marker is often an enzyme whose action modifies the antibiotic thereby making it inactive. Markers for use in eukaryotes are usually derived from bacteria and have no eukaryotic counterparts.

selected-ion monitoring or **mass fragmentography** or **molecular fragmentography** a type of **gas chromatography/mass spectrometry** in which the intensities of one or more molecular or fragment ions selected from the mass spectrum of a particular compound are monitored continuously as a means of quantifying that compound.

selectin any of a group of leukocyte surface molecules that act as

leukocyte adhesion molecules; they are classed as CD62 in the **CD marker** system. All have **lectin** family carbohydrate-binding domains and EGF-repeats, with four motifs. They are expressed on the surface of platelets and endothelial cells as well as leukocytes. **E selectin** (CD62E), M_r 107–115 000 in various glycosylated forms, is expressed on endothelial cells, being induced by cytokines such as interleukin 1 β and tumour necrosis factor α in 3–6 hours. It mediates endothelial cell binding to neutrophils, monocytes, and some memory T cells. **L selectin** (or lymph node homing receptor; CD62L), M_r 74 000 (on lymphocytes), is constitutively expressed on monocytes, lymphocytes (thymocytes, NK cells), neutrophils, eosinophils, and basophils. It mediates the adherence of lymphocytes, neutrophils, and monocytes to endothelium, including that of lymphocytes to endothelial cells of high endothelial venules in peripheral lymph nodes. It binds to **MadCAM** and CD34. **P-selectin** (or PADGEM; *abbr.* for platelet activation dependent granule external membrane protein), M_r 140 000, is expressed at the surface of activated platelets and endothelial cells, and is inducible within minutes by thrombin, histamine, or peroxides from α granules of platelets or Weibel–Palade bodies of neutrophils. It mediates the adhesion of neutrophils and monocytes to platelets and endothelial cells.

selection (*in microbiology*) a laboratory method in which a mixture of microorganisms is cultured under particular growth conditions that permit only cells with certain characteristics to survive, thereby enabling their isolation.

selection pressure the intensity with which natural selection operates; it is often measured by the change in **gene frequency** per generation due to the effects of natural selection.

selectively labelled indicating an isotopically labelled molecule in which the position(s) of the labelling is known, but the number of labelling nuclides at that (those) position(s) is not known; e.g. selectively labelled ethanol is designated as [1,2- ^2H]CH₃-CH₂-OH, which indicates that some, or all, of the hydrogen atoms on carbon atoms 1 and 2 are ^2H atoms.

selective medium a culture medium designed either to encourage or to inhibit the growth of certain types of organisms, especially microorganisms.

selective theory of immunity or **elective theory of immunity** any theory that ascribes to antigens a selective function in immunity by which antigens select cells genetically prepared to respond specifically and cause them to multiply and differentiate. They include the **clonal-selection theory** and the **natural-selection theory of immunity**.

Compare **instructive theory of immunity**.

selectivity (*in informatics*) an alternative name for **precision** (def. 2).

selector a gene whose product controls the formation and identity of a discrete set of cells in an embryo that forms a particular structure (e.g. eye, leg, or wing). One type includes the *Hox* genes, whose products differentiate between homologous morphological fields; another type consists of field-specific genes (e.g. *eyeless* or *Distalless* in *Drosophila*), which direct the formation of entire complex structures.

selector gene any of a class of genes encoding transcription factors that specify cell type and tissue, organ, and regional identity in animals such as *Drosophila*, in which they were first described.

selenium *symbol:* Se; a metalloid element of group 16 of the (IUPAC) **periodic table**; atomic number 34; relative atomic mass 78.96. Its main oxidation states are -2, +2, +4, and +6, with properties similar to those of sulfur, but more metallic. It occurs in various allotropic forms (grey, red, black); the grey form shows some electrical conductivity, which is enhanced by light, and it is used in 'selenium cells' to measure light intensity. The most abundant isotope is selenium-80 (mass 79.916; relative abundance 49.8%); others are selenium-74 (0.9%), selenium-76 (9.0%), selenium-77 (7.6%), selenium-78 (23.5%), and selenium-82 (9.4%). Radioactive isotopes are **selenium-72**, **selenium-73**, **selenium-75**, and **selenium-79**. Selenium is an essential trace element, required for the formation of **selenoproteins**, notably **glutathione peroxidase**. Gut absorption is poor, but selenium deficiency is rare (seen, e.g., in some parts of China with low soil selenium), and manifests as myopathy (especially cardiomyopathy). Measurement of red-cell glutathione peroxidase activity gives an index of selenium status.

selenium-72 a radioactive nuclide of selenium, $^{72}_{34}\text{Se}$, mass 71.927; it emits gamma radiation (0.046 Mev) and has a half-life of 8.4 days.

selenium-73 a radioactive nuclide of selenium, $^{73}_{34}\text{Se}$, mass 72.927; it emits a β^+ particle (1.32 Mev) and gamma radiation (0.361 Mev) and has a half-life of 7.1 h.

selenium-75 a radionuclide of selenium, $^{75}_{34}\text{Se}$, mass 74.923; it emits gamma radiation (0.481 Mev) and has a half-life of 118.5 days.

selenium-79 a radionuclide of selenium, $^{79}_{34}\text{Se}$, mass 78.918; it emits an electron (β^- particle, 0.16 Mev), no gamma radiation, and has a half-life of 6.5×10^4 years.

selenoamino acid an amino acid in which selenium replaces a sulfur atom; *see* **selenocysteine**, **selenomethionine**.

selenocysteine *symbol:* U or Sec; $\text{H-Se-CH}_2\text{-CH(NH}_2\text{)-COOH}$; an essential component of glutathione peroxidase and some other proteins (*see* **selenoprotein**). For its synthesis, a special tRNA, charged with serine, responds to a UGA codon. The serine is converted to selenocysteine just before its use on the ribosome. It is assumed that the neighbouring base sequence indicates a special sense for this codon, which is normally a 'stop' codon.

selenocysteine insertion complex *abbr.:* SIC; the complex of requirements for recoding an in-frame UGA codon as selenocysteine (Sec) in the mRNA for a selenoprotein. It comprises: a Sec codon UGA; a selenocysteine insertion sequence (**SECIS**) in the 3' untranslated region of the mRNA; the selenocysteine tRNA (Sec-tRNA^{Sec}); the elongation factor **SelB**; and the SECIS-binding protein **SBP2**.

selenomethionine $\text{CH}_3\text{-Se-}[\text{CH}_2]_2\text{-CH(NH}_2\text{)-COOH}$; (*symbol:* Sem) a selenoamino acid used as an antimetabolite, competing with methionine; it is also found in proteins; *see* **selenoprotein**. For the solution of the phases in x-ray crystallography by single-wavelength anomalous dispersion (SAD), it is introduced into proteins by growth of bacteria on medium containing selenomethionine instead of methionine.

selenoprotein a protein containing selenium, almost invariably as **selenocysteine**, although **selenomethionine** can occur, apparently as a random substitute for methionine. Well-known selenoproteins include the mammalian **glutathione peroxidases** and tetraiodothyronine 5'-deiodinase, and bacterial formate dehydrogenases and glycine reductase.

selenoprotein P a plasma glycoprotein (42 kDa) of mammals that is rich in Lys and His residues and contains 10 selenocysteine residues per monomer. Its function is unknown.

selenoprotein W a protein (10 kDa) of skeletal and cardiac muscle that contains one selenocysteine residue per monomer. Its function is unknown.

SELEX *abbr.* for systematic evolution of ligands by exponential enrichment.

self 1 the individuality of a person or thing; the totality of components intrinsic to an individual or thing. **2** (*in immunology*) the components of an individual's own tissues that can be distinguished from foreign substances by the individual's immune system, and towards which **immunological tolerance** is shown.

self-absorption the absorption of any emission by the emitting molecules.

self antigen any (potentially) antigenic molecule originating in an individual that is recognized as nonforeign by the individual's immune system, and towards which **immunological tolerance** is normally shown. *See also* **autoimmunity**, **self-tolerance**.

self-assembly the formation of a complex entity from more simple, identical units without intervention from any external agency.

self-assembly doctrine a doctrine elaborated by Aaron Klug (1926–), Lithuanian-born British molecular biologist, and Caspar to explain the assembly of small viruses and subcellular organelles. It is postulated that the structure assembles as a result of specific binding sites on proteins that interact to form a scaffold on which other components form.

self-catabolite repression repression of gene expression by a **catabolite** formed within the same organism.

self-cloning the cloning of a gene within the species from which it was derived, a technique that in some countries attracts less strin-

gent government restrictions than when a gene is cloned in another species, being considered the less hazardous of the two approaches with respect to the genetic environment.

self determinant a **determinant** originating from the tissue of an organism and thus treated as **self** (def. 2) by the immune system of that organism (except in the case of autoimmune pathology; *see* **autoimmunity**).

self-fertilization the union of male and female gametes of the same organism.

self-hybridization hybridization between nucleic acids that exhibit complementarity.

selfing (*in microbiology*) the production of wild-type 'transductants' by infection of an auxotrophic strain with a transducing phage grown on the same auxotroph as the donor.

selfish DNA hypothesis a hypothesis that accounts for the presence in eukaryotic genomes of large amounts of repetitive DNA (*see* **repetitive sequences**). Because there is no evidence that such DNA serves any useful purpose for its host, it has been termed **selfish DNA** or **junk DNA**, and is suggested to be a molecular parasite that has disseminated itself throughout the genome. It is a mystery why natural selection has not eliminated 'selfish DNA'.

self tolerance the state in which the immune system of an individual lacks reactivity against potentially antigenic molecules originating within that individual. Self tolerance develops during perinatal life. *See also* **acquired tolerance**, **autoimmunity**, **immunological tolerance**.

Seliwanoff test a test for ketohexoses based on the production of a red colour when the sample is boiled with a solution of 0.05% w/v resorcinol in 3 M hydrochloric acid. The test relies on the fact that ketoses are dehydrated more rapidly than aldoses to yield furfural products. [After Feodor Feodorowitsch Seliwanoff (1859–1938), Russian chemist.]

Sem *symbol* for a residue of L-selenomethionine.

SEM or **S.E.M.** **1** *abbr.* for standard error of estimate of mean. **2** *abbr.* for scanning electron microscope; *see* **electron microscope**.

sem-5 the gene for Sem-5, sex muscle abnormal protein 5, in *Caenorhabditis elegans*. Sem-5 acts in vulval induction and sex myoblast migration, contains SH2 and SH3 domains (*see* **SH domain**), and is phosphorylated by some tyrosine kinase receptors. Mutations of the *sem-5* gene block its function in the worm.

Sema *abbr.* for **semaphorin**.

semantide or **semantophoretic molecule** or **informational macromolecule** any of the macromolecules that carry the information of the genes or a transcript (or a translation) thereof. The genes themselves are **primary semantides**, messenger RNA molecules are **secondary semantides**, and most polypeptides are **tertiary semantides**.

semantophoretic molecule *an alternative name for semantide*.

semaphorin (*abbr.*: Sema) or **collapsin** any of a family of secreted or membrane-bound proteins (≈ 750 residues) that are expressed in various embryonal and adult tissues. In the developing nervous system they are released by cells that surround the paths of axon migration and can repel (e.g. Sema 3A and Sema 3F) or attract growing axons. They may also have non-neuronal functions. Their extracellular N-terminal regions (≈ 500 residues) are homologous to those of hepatocyte growth factor receptors and of **plexins**. Semaphorins are overexpressed during invasive or metastatic progression of tumours. Plexins are components of semaphorin receptor complexes.

semen the fecundating fluid of male higher animals, consisting of spermatozoa suspended in seminal plasma – secretions of the accessory glands.

semenogelin one of two major gel-forming proteins of semen. These proteins have 80% of their amino-acid residues in common, and their genes are localized to the long arm of chromosome 20. They are hydrolysed by a **kallikrein**-like protease.

semi+ *prefix* **1** half. **2** partial or partially; intermediate.

SEMI *abbr.* for specific endogenous mitotic inhibitor; *see* **chalone**.

semialdehyde any organic compound formed by the reduction of one carboxyl group of a dicarboxylic acid to an aldehyde group, as in glutamic semialdehyde.

semiconductor any material, e.g. germanium or silicon, whose electrical conductivity lies between that of conductors and insulators and increases with increasing temperature. Its crystal structure

has atomic bonds that allow the conduction of electric current by either positive or negative carriers when the appropriate additives (dopants) are present.

semiconservative replication of DNA *see* **replication of DNA**.

semiconstitutive mutant a mutant in which negative regulation is partially lost, so that a gene is expressed in the absence of inducer, but at a lower level than in the fully constitutive mutation, yet in the presence of inducer the expression reaches the fully constitutive level. *See also* **constitutive mutation**.

semi-micro **1** describing or concerning something moderately small; applied to a scale of operation, an item of equipment, a quantity of material, etc. **2** (*in analytical chemistry*) denoting the analysis of amounts of substance in the range 10–100 mg. *Compare* **micro** (def. 1). *See also* **microanalysis**.

seminal **1** a pertaining to seed. **b** of, or relating to, semen. **2** germinating new concepts; fundamentally original.

seminal plasma the suspending fluid in which semen is ejaculated.

seminalplasma *another name for caltrin*.

seminolipid 1-O-alkyl-2-O-acyl-3-(β -3'-sulfolactosyl) glycerol; the major sulfolactoglycerolipid of mammalian testes and sperm.

semiochemical any chemical substance that delivers a message or signal between two organisms. There are two classes: (1) **pheromones**, in which information transfer is intraspecific; and (2) **allelochemicals**, in which information transfer is interspecific. *See also* **allomone**, **kairomone**.

semiotics *functioning as sing.* **1** the practice of symptomatology; a term that became obsolescent, but has been reintroduced in connection with CT, NMR, and other imaging techniques. **2** the philosophical theory of signs and symbols, having three branches: syntactics, semantics, and pragmatics.

semipermeable membrane a membrane that allows the passage of only certain solutes, usually small molecules, but is freely permeable to solvent.

semipolar double bond *an alternative name for dipolar bond*.

semiquinone any free radical derived from a quinone or quinoid compound by removal of a single hydrogen atom. *Compare* **quinone**.

semisolid medium (*in cell culture*) a medium of consistency between those of a solution and a full gel.

semisynthesis the partial synthesis of a chemical compound by chemical or/and enzymic modification of one isolated from natural sources or produced biotechnologically (e.g. by fermentation). The procedure has been used successfully in the manufacture of artificial penicillins and cephalosporins. —**semisynthetic** *adj.*

semisystematic name or **semitrivial name** (*in organic chemistry*) a name of a molecule in which only a part is used in a systematic sense; e.g. (meth)ane, (but)ene, (calci)diol (in each of which only the part of the name outside the parentheses is systematic). Most names in organic chemistry are of this type. *Compare* **systematic name**, **trivial name**.

senescence the process of ageing. —**senescent** *adj.*

senescence-associated gene *abbr.*: SAG; any gene expressed during leaf senescence, fruit ripening, death of floral parts or unpolinated fruit tissues, and in seeds of germinating plants. Their products include cysteine proteases, aspartic proteases, other enzymes, polyubiquitin, metallothioneins, and pathogenesis-related proteins. They may be expressed early or late in senescence, in an organ-specific manner, or show enhanced expression due to stress (e.g. drought). Some respond to ethylene, others respond to abscisic acid.

senile aged, to a point of severely decreased capability. —**senility** *n.*

senna a preparation of the dried leaves of *Cassia angustifolia* or *C. senna* used as a laxative. It contains glycosides of hydroxyanthracene (sennoside B), which are metabolized to purgative anthraquinones by colonic bacteria.

sense DNA *see* **coding strand**.

sense strand (of duplex DNA) *see* **coding strand**.

sensitivity **1** an index of the ability of any analytical method or other detection procedure to make quantitative determinations at very low levels. **2** (*in metabolic control theory*) the susceptibility of flux through a pathway to change in response to change in the level of one of the component enzymes, expressed quantitatively in terms

of the **flux control coefficient**. An alternative meaning arises when an allosteric ligand acts at several points in a pathway, where a plot of the fractional modification in flux versus ligand concentration yields a sigmoidal curve for a positive effector; the sensitivity in this case can be derived from the slope of the sigmoidal curve. **3** (*in informatics*) an alternative name for **recall**.

sensitivity coefficient former name for **flux control coefficient**.

sensitization or **sensitisation** **1** enhanced reactivity to any treatment (such as exposure to an agonist) of any tissue, cell, or molecular system resulting from prior experience or treatment (often by the same agonist). **2** the conditioning of an animal by antigen in such a way that **hypersensitivity** reactions occur on subsequent exposure to the antigen. **3** the attachment of antibody to sheep red blood cells to make them susceptible to lysis by complement in the **complement-fixation test**. Red blood cells treated in such a way are commonly referred to as **sensitized cells**. —**sensitize** or **sensitise** *vb*.

sensitizer or **sensitiser** *see allergen*.

sensor any device that records the level of a substance of interest or under investigation, using physical parameters (heat, conductivity) or chemical methods. Sensors are often applied to continuous monitoring in flow systems; **biosensors** utilize the reactions of enzymes immobilized on a probe and often coupled with a second substrate that yields a coloured or fluorescent product.

sensor kinase *abbr.*: SK; a histidine kinase that forms one element of the **two-component regulatory systems** that perform signal transduction in microorganisms and plants. Sensor kinases are often membrane proteins that respond to environmental changes.

sensory rhodopsin either of two phototaxis proteins (SRI or SRII) of plasma membranes of halobacteria, similar in structure to the light-driven proton pump bacteriorhodopsin, that influence bacterial migration via signals to the flagellar motor. Their action is mediated by integral membrane proteins (HtrI and HtrII respectively) that extend far into the cytoplasm.

sensory transducer any component of bacterial systems involved in signal transduction. An example is the *ntxB/ntxC* system, which occurs in several bacteria. In *Escherichia coli* under nitrogen limitation the product of the *ntxB* gene, NtrB (EC 2.7.1.–), activates NtrC – the *ntxC* gene product – by phosphorylating it; in nitrogen excess it reverses this. NtrC contains an ATP-binding domain that interacts with **sigma factor** σ^{54} . Another example is sensory rhodopsin I transducer from archaeobacteria. This is a typical seven-transmembrane-domain **opsin**-type protein used for sensing light. *See also che*.

sentrin an alternative name for **SUMO**.

separase *see separase*.

separase a cysteine peptidase, EC 3.4.22.49, that cleaves SecI of the **cohesin** complex to cause sister chromatid separation at the anaphase stage of the cell cycle. Most separases are large molecules (180–250 kDa) that have a catalytic domain homologous to that of the **caspsases**, and a highly conserved C-terminal region. Separases are inhibited by binding to **securin**.

separation (*in genetics*) the break-up of a cointegrate into two or more **replicons** of similar sizes. *Compare excision*.

Sephacel *proprietary name* for a gel-filtration medium based on **cellulose** cross-linked using **epichlorohydrin** so that a mesh results, the size of the apertures in the mesh being determined by the extent of cross-linking.

Sephacryl *proprietary name* for a gel-filtration medium prepared from allyldextran covalently cross-linked using *N,N*-methylene bisacrylamide, to yield a mesh; the size of the apertures in the mesh depend on the degree of cross-linking.

Sephadex *proprietary name* for a gel-filtration medium based on **dextran** cross-linked using **epichlorohydrin** so that a mesh results, the size of the apertures in the mesh being determined by the extent of cross-linking.

Sepharose *proprietary name* for a gel-filtration medium based on **agarose** cross-linked using **epichlorohydrin** to form a mesh, the size of the interspaces being determined by the extent of cross-linking.

septanose the form of any **monosaccharide**, or monosaccharide derivative, that contains a ring consisting of six carbon atoms and one oxygen atom. In monosaccharide symbolism the septanose form

may be indicated by the suffix *s*; e.g. Glcs symbolizes glucoseseptanose. *Compare furanose, heptose, pyranose*.

septate divided by, or involving, a **septum** or septa.

septation the process of forming the **septum** that cuts a cell into two at the end of the **cell cycle** in bacteria.

septic shock the clinical state of hypotension and multiorgan dysfunction that results from systemic infection by Gram-negative bacteria. Bacterial lipopolysaccharide endotoxins stimulate the host's immune system, causing the secretion of **tumour necrosis factor- α** (cachectin) and other factors.

septum **1** (*in anatomy*) a wall of tissue, sheet of cells, or other membrane-like structure that partitions two compartments. **2** a disk of silicone rubber, PTFE, or similar material used in any apparatus to seal an injection port. A syringe needle can pierce the septum for the purpose of injection, and on withdrawal the elasticity of the septum ensures that the hole reseals.

Sequenase *proprietary name* for a chemically modified T7 DNA polymerase with high **processivity**. It is the usual choice for DNA sequencing by the **chain-termination method**. *See also ThermoSequenase*.

sequenator an apparatus for determining the sequence of monomeric residues (e.g. amino acids) in an ordered linear polymer (e.g. an oligopeptide) by repeating a chemical process.

sequence **1** the ordinal arrangement of the constituent parts of a biopolymer, e.g. the order of amino-acid residues in a polypeptide chain, or of the nucleotide residues in a polynucleotide chain; the known arrangement of such units in any biopolymer or fragment. **2** any particular segment, occurring in, or derived from, a biopolymer, having a known order of its constituent parts; a synthetic polymer composed of parts equivalent to those occurring naturally, and present in a particular known order. **3** to determine the order of residues in a biopolymer or fragment. —**sequential** *adj*.

sequence analysis package a suite of programs for the computational analysis of protein and/or nucleic acid sequences, including, for example, tools for fragment assembly, mapping, translation, automatic and manual sequence alignment, phylogenetic analysis, database searching, pattern recognition, property visualization, composition analysis, and RNA secondary structure plotting. One of the first academic packages was GCG, which then became a commercial product; a freely available alternative is EMBOSS, the European Molecular Biology Open Software Suite.

sequence assembly or **assembly** the process by which the overlapping DNA sequence readings from a single sequencing experiment (usually fragments ~500–800bp in length) are correctly ordered along the genome. *See also sequence assembly software*.

sequence assembly software software for computational **sequence assembly**, including programs for base calling from sequencing gels (e.g. PHRED) and for ordering the resulting overlapping DNA sequence fragments (e.g. PHRAP).

sequence compression *see band compression*.

sequence database or (*sometimes*) **primary database** a database that houses biomolecular sequences (nucleotide or protein) and associated annotation (relating to organism, species, function, mutations linked to particular diseases, functional or structural features, bibliographic references, etc.): e.g. EMBL, GenBank, and DDBJ are the primary nucleotide sequence databases; PIR-PSD, Swiss-Prot, TrEMBL, JIPID, and PRF are primary protein sequence databases.

sequence filter (*in bioinformatics*) a program that masks regions of local compositional bias in biological sequences, usually as a pre-processing step for database-search programs to reduce the number of spurious matches and thereby increase the likelihood that the highest scoring matches are the result of common descent. Examples include SEG, DUST, and XNU.

sequence hypothesis the hypothesis, formulated by F. H. C. Crick in 1958, that 'the specificity of a piece of nucleic acid is expressed solely by the sequence of its bases, and that this sequence is a (simple) code for the amino-acid sequence of a particular protein.'

sequence ladder the ladder-like bands of separated components occurring in the electrophoresis gel that result from DNA sequencing experiments.

sequencer an apparatus for automatically determining the sequence of monomeric residues in an ordered linear polymer.

sequence rule or **Cahn–Ingold–Prelog rule** or ***R S* convention** (of configuration specification) a system for specifying the absolute molecular chirality of a chemical compound. This system considers the sequence of the proton numbers of the atoms directly attached to a chiral centre (see **chirality**); if two or more of these atoms have the same proton number, their substituents are then taken into account, the group with substituents of highest proton number taking precedence. When a multiple bond to a substituent is present, the substituent is arbitrarily considered to occur twice, or thrice; an isotope of higher nucleon number takes precedence over one of lower number. For a tetrahedral centre (e.g. a carbon atom) the substituent with the lowest priority is placed away from the observer (behind the chiral atom) with the other three projecting towards the observer; if these three substituents lie in a clockwise (right-handed) array of decreasing priority, then the chiral centre is designated with the stereochemical descriptor *R*, denoting Latin *rectus*, right; if the substituents lie in an anticlockwise (left-handed) array of decreasing priority, then the chiral centre is designated with the stereochemical descriptor *S*, denoting Latin *sinister*, left. For the name of a compound consisting of molecules with a single chiral centre the descriptor *R* or *S*, with a preceding locant if needed, is formed into a prefix by placing it in parentheses and adding a linking hyphen; a racemate with a single chiral centre in its molecules is labelled with the prefix (*RS*). When a molecule contains more than one chiral centre the prefix to the name is composed of multiple descriptors, each preceded by an appropriate locant; e.g. (2*R*,3*R*)-2,3-dihydroxybutanedioic acid (= L_g-tartaric acid). If only the relative, but not the absolute, configurations of two or more chiral centres in a molecule are known, these centres may be designated with the descriptors *R** and *S** (spoken as *R* star, *S* star), preceded when necessary by appropriate locants, on the arbitrary assumption that the chiral centre first cited (which usually is the one with the lowest locant) has an *R* configuration; for examples, compare the systematic names of **allothreonine** and **threonine**. See also **D/L** convention. Extensions of the sequence rule are the ***E/Z* convention**, the **pro-*E*/pro-*Z* convention**, the **pro-*R*/pro-*S* convention** and the ***Re/Si* convention**. [After Robert Sidney Cahn (1899–1981), British natural-products chemist, editor, and scientific semanticist, (Sir) Christopher Kelk Ingold (1893–1970), British physical organic chemist, and Vladimir Prelog (1906–98), Bosnian-born Swiss organic chemist, who jointly developed the system and described it in a series of three papers published in 1951, 1956, and 1966.]

sequence-tagged site *abbr.*: STS; a unique short, single-copy DNA sequence that characterizes a mapping landmark on the genome. Such sequences provide unambiguous identification of DNA markers generated by the Human Genome Project (see **HUGO**). STSs bind to **YACs**. If two YACs contain the same STS they must overlap. The YACs can be built up into an overlapping series of clones (a **contig**) covering an entire gene.

sequencing the act, or process, of determining the **sequence** (def. 1) of proteins or nucleic acids. See **chain-termination method**, **chemical cleavage method**, **solid-phase technique**.

sequencing by hybridization see **SBH**.

sequencing centre a research institute that provides a major focus for genome mapping and sequencing, often also providing genome analysis software for free use by the community. Notable examples include the Sanger Institute in the UK, and The Institute for Genome Research (TIGR) and the Whitehead Institute for Biomedical Research (WIBR) in the USA.

sequencing gel a polyacrylamide gel run to resolve oligonucleotides produced in a DNA sequencing procedure. See **chain-termination method**, **chemical cleavage method**.

sequential analysis the analysis of a protein or nucleic-acid **sequence** (def. 1).

sequential mechanism an enzyme reaction involving two or more substrates in such a way that all the substrates must be bound to the enzyme to form the central complex before any products can be released. A sequential mechanism may be an **ordered mechanism** or a **random mechanism**.

sequestering agent see **chelating agent**.

sequestration 1 the process of removal or separation. **2** (in *chemistry*) the effective removal of ions from solution by **coordination**

with another kind of ion or molecule to form a firm complex molecule with different properties from the original ion. Compare **chelation. 3** (in *cell biology*) the intracellular enclosing of material in an organelle. —**sequester** *vb*.

Ser *symbol* for a residue of the α -amino acid L-serine (alternative to **S**).

SER *abbr.* for smooth endoplasmic reticulum (see **endoplasmic reticulum**).

sera a plural of **serum**.

SERCA *abbr.* for sarcoplasmic/endoplasmic reticulum **calcium-transporting ATPase**, EC 3.6.1.38; a family of Ca²⁺ pump integral membrane protein isoforms of sarcoplasmic or endoplasmic reticulum. They catalyse the hydrolysis of ATP coupled with Ca²⁺ transport from the cytosol.

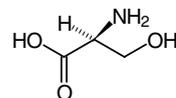

serglycin a proteoglycan of secretory vesicles of leukocytes. In rat, the core protein (104 amino acids) contains a central domain of 49 alternating Ser and Gly residues. Some 15 chondroitin sulfate/dermatan sulfate chains are linked to the Ser residues in this domain.

serial analysis of gene expression *abbr.*: SAGE; a method for detecting and quantifying gene expression. Short sequence tags (10–14bp), each serving as a unique marker for its transcript, are extracted from defined locations at the 3' end of cDNAs, concatenated, inserted into vectors, and cloned in bacteria. The concatamers are sequenced and the tags counted. The relative numbers of each tag provide an estimate of the expression level of the corresponding transcript. Also, tags are matched with their corresponding genes where the gene sequences are known. SAGE projects usually generate an order of magnitude more tags than expressed sequence tag (EST) sequencing projects, allowing statistically more accurate and more sensitive expression estimates to be made.

serial dilution a method of achieving dilution of a liquid by sequentially transferring a sample of predetermined volume into another, empty, vessel (usually a tube), which is then made up with diluent to the same total volume as the first. The overall dilution achieved is (v/s)^{*x*} fold, where *v* is the chosen total volume in each tube, *s* is the size of the sample, and *x* is the number of times the procedure is repeated.

serinate 1 serine anion; the anion, HO–CH₂–CH(NH₂)–COO[–], derived from **serine. 2** any salt containing serine anion. **3** any ester of serine.

serine *the trivial name for* α -amino- β -hydroxypropionic acid; 2-amino-3-hydroxypropanoic acid; HO–CH₂–CH(NH₂)–COOH; a chiral α -amino acid. L-Serine (*symbol*: S or Ser), (*S*)-2-amino-3-hydroxypropanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: AGC or AGU; UCA, UCC, UCG, or UCU. In mammals, it is a non-essential dietary amino acid, and is glucogenic. D-Serine (*symbol*: D-Ser or D-Ser), (*R*)-2-amino-3-hydroxypropanoic acid, in both free and combined forms occurs in silkworms and earthworms; residues of D-serine occur in certain peptide antibiotics, e.g. polymyxins D₁ and D₂. [Note: the absolute configuration of D-serine (and hence that at the α -carbon atom of other α -amino acids of the D series) is identical to that of D-glyceraldehyde (and hence that at the reference carbon atom of other monosaccharides of the D series).]

L-serine

L-serine dehydratase EC 4.2.1.13; *systematic name*: L-serine hydro-lyase (deaminating); *other names*: serine deaminase; L-hydroxyaminoacid dehydratase. An enzyme that catalyses a reaction between L-serine and water to form pyruvate and ammonium ion. It is a pyridoxal-phosphate enzyme. The enzyme for gluconeogenesis from serine in *Escherichia coli* is a 4Fe–4S protein.

serine hydroxymethyl transferase see **glycine hydroxymethyltransferase**.

serine-like carboxypeptidase *see* **serine endopeptidase**.

serine C-palmitoyltransferase EC 2.3.1.50; an enzyme involved in the biosynthesis of **sphingoid** bases. It catalyses the formation of 3-dehydro-D-sphinganine from palmitoyl-CoA and L-serine, releasing CoA and CO₂. Pyridoxal-phosphate is a coenzyme.

serine peptidase any enzyme that has a residue of serine (and one each of aspartate and histidine) at the active centre and is irreversibly inhibited by organic fluorophosphates (which phosphorylate the serine's hydroxyl group). Serine peptidases are of two types: (1) **serine-type carboxypeptidases**, and (2) **serine endopeptidases**, subclass EC 3.4.21. During catalysis by serine peptidases an acyl-enzyme intermediate is formed by esterification of the hydroxyl group of the reactive serine with the carbonyl group of a sensitive peptide bond of the substrate. The serine endopeptidase group includes **chymotrypsin**, most **elastases**, **kallikrein**, **thrombin**, **trypsin**, and a number of microbial proteinases. *See also* **serine-type carboxypeptidase**.

serine/threonine kinase a **protein kinase** that phosphorylates serines or threonines on its target protein.

serine/threonine-specific protein phosphatase EC 3.1.3.16; *recommended name*: phosphoprotein phosphatase; *other names*: protein phosphatase-1; protein phosphatase-2A; protein phosphatase-2B; protein phosphatase-2C. This name includes enzymes that hydrolyse the serine- or threonine-bound phosphate group from phosphoproteins.

serine transhydroxymethylase *see* **glycine hydroxymethyltransferase**.

serine-type carboxypeptidase EC 3.4.16.1; any enzyme of broad specificity that hydrolyses protein with release of a C-terminal amino acid.

serinium serine cation; the cation, HO-CH₂-CH(NH₃⁺)-COOH, derived from **serine**.

serino+ *prefix* denoting the group, HO-CH₂-CH(NH-)-COOH, derived from **serine** by loss of hydrogen from the amino group.

sero+ *comb. form* denoting a connection within or origin in **serum**.

serological pertaining to, or originating in, **serum**; connected with the study of **serum**.

serology the study of **serum**; in particular, the immunological phenomena involving circulating antibody that may be observed *in vitro*.

serosa a **serous membrane**, especially the peritoneal covering. —*serosal* *adj.*

serotonergic 1 describing a nerve that is activated by **serotonin**. **2** describing a nerve that acts by the release of serotonin from the nerve endings. *Compare* **adrenergic**, **aminergic**, **cholinergic**, **peptidergic**, **purinergic**.

serotonin 5-hydroxytryptamine (*abbr.*: 5-HT); a monoamine neurotransmitter occurring in the peripheral and central nervous systems and having hormonal properties; it is also found in mast cells, platelets, brain, and the enterochromaffin cells of the gastrointestinal tract, and causes vasoconstriction, increased vascular permeability, and contraction of smooth muscle. Its reuptake via a 5-HT transporter is sensitive to antidepressants and to cocaine. Serotonin is involved in mood control, fear, and anxiety. It is formed from tryptophan, after hydroxylation to 5-hydroxytryptophan, by tryptophan 5-monooxygenase (EC 1.14.16.4; requires tetrahydrobiopterin), followed by decarboxylation by aromatic-L-amino-acid decarboxylase (EC 4.1.1.28). It is a substrate for **monoamine oxidase**.

serotonin receptor *see* **5-hydroxytryptamine receptor**.

serotransferrin *see* **transferrin**.

serous 1 relating to or resembling **serum** (or similar watery fluid). **2** producing a fluid resembling serum.

serous membrane or **serosa** a thin connective-tissue membrane lining certain closed body cavities and reflected over the viscera. The peritoneum of the abdomen, pleura of the chest, and pericardium of the heart are all serous membranes. Each consists of a **parietal layer**, lining the walls of the cavity, and a **visceral layer** covering the organs. The two are continuous, forming a closed sac. *Compare* **mucous membrane**.

serpentine domain any series of transmembrane segments of a single polypeptide chain of a membrane protein that traverses the lipid bilayer several times, as, e.g., in **7TM proteins**.

serpin any of a superfamily of proteins, many of which inhibit serine proteases, and are highly similar to classical serine protease inhibitors, such as **α₁-antitrypsin** or antithrombin. The superfamily is now considered to extend beyond compounds that are known to be protease inhibitors and, based on similarity, includes proteins such as **ovalbumin** and **angiotensinogen**, which have no inhibitory function. [From serine protease inhibitor.]

serpocidins members of the serine protease (with chymotryptic activity) superfamily that are present in neutrophil **azurophil granules**. They include: **cathepsin G**, which is active against proteins of Gram-positive and Gram-negative bacteria; and **azurocidin**, **elastase**, and **proteinase 3**. The latter three are encoded by a gene cluster at 19pter, and are active against proteins of Gram-negative bacteria.

Sertoli cell or **sustentacular cell** a supporting cell of the mammalian testis that surrounds and nourishes developing sperm cells. [After Enrico Sertoli (1842–1910), Italian histologist.]

serum (*pl. sera* or (*esp. US*) **serums**) the liquid extruded after blood has clotted and the clot has retracted (**syneresis** (def. 2)). *Compare* **plasma**.

serum albumin or **plasma albumin** the smallest and most abundant of the plasma proteins; *M_r* 65 000–68 000 for the bovine form, 69 000 for the human. It is involved in the regulation of osmotic pressure, and in the transport of sparingly soluble metabolites. The serum albumins belong to a multigene family of proteins that includes **α₂-fetoprotein** and **vitamin D binding protein**. Human serum albumin has three homologous domains, which assemble to form a heart-shaped molecule. It is an all-α protein, containing 28 helices, ranging from five to 31 amino-acid residues, formed into six subdomains; two each of these subdomains form one of the major domains. Bovine (serum) albumin (*abbr.*: BSA) and human (serum) albumin (*abbr.*: HSA) are widely used as standards in protein estimations; these include fatty acids, amino acids (such as tryptophan), steroids, metals (e.g., calcium, copper, zinc), and hydrophobic drugs. *See also* **albumin**.

serum amyloid A *abbr.*: SAA; any plasma protein whose synthesis in liver is induced by interleukins 1 and 6 and other cytokines. **SAA1** and **SAA2** (each of 104 amino acids) are acute-phase reactants. Their cleavage releases the N-terminal polypeptide (76 residues), which forms fibrils and accumulates in reactive amyloidosis. **SAA4** is not an acute-phase reactant, does not form fibrils, and is a normal constituent of high-density lipoproteins (HDL). Their function is unknown.

serum amyloid P-component *abbr.*: SAP; a precursor of amyloid component P. Amyloid component P is found in basement membranes, and is associated with **amyloid** deposits.

serum converting enzyme a former name for **angiotensin converting enzyme**.

serum globulin any **serum protein** that is also a **globulin**. An early classification of globulins was based on their mobility on electrophoresis. **Serum albumin** moves the fastest; behind albumin on paper electrophoresis or cellulose acetate strips are two bands known as the α₁- and α₂-globulin bands, followed by a β-globulin band, with the γ-globulins forming a diffuse band near the origin. The α₁-globulins include thyroxine-binding protein, transcortin, α₁-glycoprotein, α-lipoprotein, and antitrypsin; the α₂-globulins include haptoglobin, α₂-glycoprotein, macroglobulin, and ceruloplasmin; the β-globulins include transferrin, β-lipoprotein, and β-glycoprotein; the γ-globulins comprise the immunoglobulins.

serum protein any protein contained in serum; the term is usually applied to those proteins present in high quantities. The most prominent of these is **albumin**, which is present in the normal serum of human adults in the range 34–48 g L⁻¹. *See also* **serum globulin**.

serum response element *abbr.*: SRE; a stretch of DNA, usually of the sequence CCATATTAGG, that regulates promoters for genes that are activated by addition of serum to cell cultures.

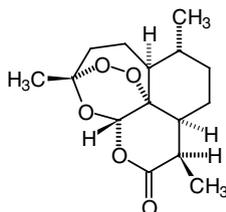

serum spreading factor *see* **vitronectin**.

seryl the acyl group, HO-CH₂-CH(NH₂)-CO-, derived from **serine**. **sesqui+** *comb. form 1* denoting one-and-a-half times; in a ratio of three parts to two. **2** (*in chemistry*) indicating a compound having one-and-a-half molecular proportions of the specified element group, or unit, either in relation to a second component, as in

sesquioxide (e.g. chromium sesquioxide, Co_2O_3), or in relation to a reference compound, as in **sesquiterpene**; it also sometimes denotes a compound intermediate in constitution between two others, as in sesquicarbonate (e.g. sodium sesquicarbonate, $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$).

sesquiterpene any **terpene** formed from three isoprene units, i.e. having 15 carbon atoms per molecule (a monoterpene has 10 carbon atoms and is formed from two isoprene units).

sesquiterpene lactone any sesquiterpene (15 carbon atoms) containing a lactone structure. Several are derived from *Artemisia* spp., including **artemisinin** (qinghaosu) from *A. annua* (qing hao), which has been used for almost 2000 years as an antimalarial.

artemisinin

sester+ *comb. form 1* denoting two-and-a-half times; in a ratio of five parts to two or 10 parts to 4. **2** (*in chemistry*) indicating a compound having two-and-a-half molecular proportions of the specified group or unit in relation to a reference compound, as in **sesterterpene**.

sesterterpene any **terpene** formed from five isoprene units, i.e. having 25 carbon atoms per molecule (a monoterpene has 10 carbon atoms and is formed from two isoprene units). An **ophiobolin** is an example.

sev *symbol for sevenless gene*; see **Sevenless protein**.

Sevav method a method for removing proteins from nucleic acids. The proteins are precipitated after repeated denaturation by shaking with a solution of octanol in chloroform.

Sevenless protein *abbr.*: Sev; a **tyrosine kinase** receptor, encoded by the *sevenless* (*sev*) gene, that participates in differentiation of R7 photoreceptors in *Drosophila*. Sev has a ligand, **Boss**, the product of the *bride of sevenless* (*boss*) gene; it is expressed by R8 photoreceptor cells and internalized in a Sev-dependent manner.

seven-minute phosphate see **labile phosphate**.

seven-transmembrane-domain protein or **seven-transmembrane-segment protein** or **seven-transmembrane-helix protein** or **7TM protein** a protein that contains, in a single polypeptide chain, seven hydrophobic domains that traverse the lipid bilayer. This structural characteristic is typically used to describe the structures of receptors that couple to effector systems through **G proteins**; these are also sometimes referred to as **serpentine receptors**. The structures of bacteriorhodopsin (a 7TM protein but not a G protein-coupled receptor (GPCR)) and of bovine rhodopsin (which is a GPCR) have been determined to high resolution; similar structural characteristics have been attributed to several other proteins, largely on the basis of sequence comparison. Thus, for many proteins, the name '7TM protein' is a tentative one, and the implication that the transmembrane domains are helical is equally so.

seven-up a receptor required for photoreceptor cells during eye development. It is a **zinc-finger** DNA-binding protein with two forms (1 and 2) generated by alternative splicing.

severe combined immunodeficiency see **SCID**.

sex chromatin a condensed mass of **chromatin** that represents an inactivated X chromosome. In mammalian nuclei, each X chromosome apart from the activated one forms a sex chromatin body or **Barr body**.

sex chromosome a chromosome involved in sex determination. In many species, these are the **X chromosome** and **Y chromosome**. They are distinguished from the **autosomes** i.e. all the other chromosomes of that species. In some species, however, e.g. fish of the genus

Xiphophorus, sex determinants are spread over a number of chromosomes.

sex determination the specification of the sex of an individual organism by genes. In many animal species, these genes are located on the **X chromosome** and the **Y chromosome**. Their effects are manifested as a result of secretion of **androgens** and **estrogens**.

sex-determining region of Y chromosome see **SRY**.

sex factor or **fertility factor** or **F factor** or **F agent** an episomal genetic element (see **episome**) in bacteria that enables the cell to act as a genetic donor. Cells of such donor strains are able to form stable unions with cells devoid of such factors and to transfer to them extrachromosomal material, including the sex factor, and sometimes segments of bacterial chromosomes (see **conjugation** (def. 4)). The **F plasmid** is the prototypical sex factor, responsible for conjugation in certain strains of *Escherichia coli*.

sex hormone any steroid hormone that is responsible for controlling sexual characteristics and reproductive function. **Estrogens** and **progesterone** are the female sex hormones, while **androgens** are the male sex hormones. They are produced mainly by the ovaries or testes, with contributions from the adrenals and placenta.

sex hormone-binding globulin (*abbr.*: SHBG) or **testosterone-binding globulin** a plasma glycoprotein of the globulin group, secreted by liver, that transports the sex hormones testosterone, estradiol, or their derivatives. Its level increases rapidly early in pregnancy and following estrogen therapy.

Sex lethal *symbol*: *Sxl*; a *Drosophila* gene whose product regulates sexual differentiation. It is so called because it kills flies if it is inappropriately active in males or inactive in females. The functional gene product is expressed in embryos that have the chromosomal constitution 2X:2A where A represents a single set of autosomes. Flies with an X:A ratio of 1.0 express SXL and develop as females whereas those with a ratio of 0.5 do not produce SXL and develop as males. The presence of SXL in females triggers sex-specific alternative mRNA splicing that leads to the production of sex-specific *doublesex* (*dscx*) and *transformer* (*tra*) products.

sex linkage the linkage of a gene producing a certain phenotype (often unrelated to primary or secondary sexual characters) with a **sex chromosome** (usually an X chromosome). Such a gene, or the character it determines, is said to be **sex linked**. Mutation of genes on the X chromosome is often apparent only in male offspring, which have only one X chromosome. The mutation may be masked in the female unless the mutation also occurs on the other X chromosome.

sex pilus (*pl. sex pili*) a long (2–3 μm but can be up to 20 μm) hollow proteinaceous projection from the surface of a bacterium that permits **conjugation** and the transfer of an episome from a donor 'male' cell to a recipient 'female' cell. The **F plasmid** of *E. coli* is an episome that carries genes for the expression of the **F-pilus** and is transferred as single-stranded DNA during conjugation.

sexual conjugation see **conjugation** (def. 4).

S-form *abbr.* for smooth form; describing bacterial colonies with a smooth appearance. Compare **R form** (def. 2).

SGD *abbr.* for *Saccharomyces* genome database; see **genome database**.

SGF *abbr.* for skeletal growth factor.

SGOT *abbr.* for serum glutamic-oxaloacetic transaminase (not recommended; see **aspartate transaminase**).

SGPT *abbr.* for serum glutamic-pyruvic transaminase (not recommended; see **alanine transaminase**).

sh see **programming language**.

shadow casting a procedure used in the preparation of specimens for electron microscopic examination. The specimen is exposed in a vacuum to a heavy metal evaporated with an electrically heated tungsten filament. Because the metal atoms travel in straight lines, if evaporation is from an acute angle the metal will condense on only one side of the features of the specimen leading to variations in electron density over the specimen, creating a 'shadow' effect.

SHAGGY a protein serine/threonine kinase of *Drosophila* that is highly homologous with mammalian **GSK-3**.

shaker a superfamily of voltage-gated channels for K^+ , Na^+ , and Ca^{2+} found in animal cells, named for the *Drosophila* mutant from which the first K^+ channel was cloned. Shaker proteins are homotetramers, each subunit containing six transmembrane segments. Seg-

ment 4 has a regular pattern of lysine or arginine residues in the third position. This forms the voltage sensor. Between segments 5 and 6 is a loop (the P domain) that is forced back into the membrane by two proline residues at each end (which act as helix breakers), and also contains a conserved TXYGD motif. The four P domains form the ion pore. See **AKT1**.

sham operated describing a control procedure in which all the operations employed in a surgical technique are imitated with the exception of the experimental lesion that is the subject of study.

SHAR *abbr.* for shell archive; a file format that is similar in some respects to a **TAR** file but does not require a special program to extract the archive because of a facility in the UNIX Bourne shell. The command (UNIX or Linux) to extract files from an archive programs.shar is: sh programs.shar.

Shardinger enzyme *see* **xanthine oxidase**.

shark's tooth comb a plastic device for creating wells in an electrophoretic gel. It is shaped like a comb with the teeth coming to a point.

Sharples super centrifuge a, now superseded, efficient centrifuge with a flow-through rotor in which the sedimentation path was short. It is used for harvesting bacteria, blood cells, etc. The version powered with an electric motor turned at 21 000–23 000 rpm while the air-turbine-driven version turned at 50 000 rpm. The instruments of this type have been superseded by others that can operate continuous flow rotors.

SHBG *abbr.* for sex hormone-binding globulin.

SHC a gene family first identified by screening cDNA libraries for genes encoding SH2-containing proteins (*see* **SH domain**). The mammalian gene encodes two overlapping, widely expressed proteins with a C-terminal SH2 domain that binds phosphotyrosine residues on activated growth factor receptors. Phosphorylated Shc binds **Grb2**, and may form a link between certain tyrosine kinases and the Grb2/Ras signalling pathway.

SH domain *abbr.* for Src homology domain; the **SH2 domain** is a protein module, consisting of ~100 residues, found in many proteins involved in signal transduction. Apart from Src, which contains the prototype SH2 domain (*see* **src**), these include, among many others, phospholipase C, products of proto-oncogenes such as **ABL**, **FYN**, and **FGR**, GTPase-activating protein, and protein tyrosine phosphatases. The SH2 domain has also been found in structural proteins such as **fos** and **fos**. One function of the domain is to bind to the autophosphorylated site of growth factor receptors, e.g. PDGF and EGF receptors. Proteins with SH2 domains are frequently found also to have SH3 domains. The **SH3 domain** is composed of ~50 amino acids, and was originally identified in Src, but has since been found within a number of other proteins. SH3 domains mediate protein-protein interactions through their ability to recognize and bind proteins containing specific amino-acid sequences rich in proline and hydrophobic residues. To date, there are known to be at least two general classes of ligand to which SH3 domains can bind: class I, which comprises proteins containing the consensus sequence PxLPPZP; and class II, with the sequence XPPLPxR (where x is any amino acid, and Z appears to be a residue specific to the type of SH3 domain involved). Given the nature of the proteins possessing SH3 domains and SH3-binding domains, it is clear that the protein interactions mediated by these motifs are important to the operation and maintenance of cytoskeletal architecture and intracellular signalling pathways.

SH2 domain *see* **SH domain**.

SH3 domain *abbr.* for Src homology 3 domain. *See* **SH domain**. *Also see* **src**.

shear 1 to disrupt or fracture (an entity) using forces acting parallel to a plane, rather than perpendicularly, as with tensile or compressive forces. For example, shear forces can be used to disrupt DNA or other macromolecules by enclosing the molecules between two closely applied plane surfaces moving rapidly in opposite directions. Homogenization techniques depend on shear forces. **2** the deformation or fracture produced by such forces.

shear gradient *see* **viscosity**.

shear rate *see* **viscosity**.

shear stress *see* **viscosity**.

Sherman paradox the seemingly paradoxical situation in fragile-X

syndrome whereby the risk of mental retardation appears to increase in successive generations and the daughter of an unaffected male carrier is more likely to have affected offspring than the mother of the unaffected male carrier. This phenomenon is now called **anticipation**, and is explained by the expansion of CGG repeats during maternal meiosis. [After Stephanie L. Sherman, US geneticist.]

shibire the protein homologue of **dynamin** in *Drosophila*.

shikalkin the racemic mixture of **alkannin** and its (+)(*R*) enantiomer, **shikonin**.

shikimate the anion of shikimic acid; [–]3 α ,4 α ,5 β -trihydroxy-1-cyclohexene-1-carboxylic acid; (3*R*,4*S*,5*R*)-trihydroxy-1-cyclohexene-carboxylic acid; an important intermediate, in microorganisms and plants, in the **shikimate pathway** for the synthesis of phenylalanine, tyrosine, tryptophan, and many other substances (e.g. tocopherol, vitamin K, folic acid, ubiquinone, enterobactin, and some antibiotics). The enzyme **3-phosphoshikimate 1-carboxyvinyltransferase** (EPSP synthase) in higher plants is specifically inhibited by the compound **glyphosate**, which inhibits growth and is an effective and readily degraded broad-spectrum herbicide. Shikimic acid was first isolated from the plant *Illicium religiosum* (star anise) in 1885. The name is derived from the Japanese name for this plant, *shikimi-no-ki*. *See also* **shikimate kinase**.

shikimate 5-dehydrogenase EC 1.1.1.25; *systematic name* shikimate: NADP⁺ 5-oxidoreductase; an enzyme of the **shikimate pathway** that catalyses the reduction by NADPH of 3-dehydroshikimate to shikimate with formation of NADP⁺. With the now-accepted chemical numbering for shikimate, it is in fact a 3-dehydrogenase. *See also* **pentafunctional arom polypeptide**.

shikimate kinase EC 2.7.1.71; *systematic name*: ATP:shikimate 3-phosphotransferase; an enzyme of the **shikimate pathway** that catalyses the phosphorylation by ATP of shikimate to shikimate 3-phosphate with formation of ADP. The product is the precursor of 5-*enol*pyruvylshikimate 3-phosphate (5-*O*-(1-carboxyvinyl)-3-phosphoshikimate) from which **chorismate** is formed. *See* **pentafunctional arom polypeptide** for another example. *See also* **shikimate**.

shikimate pathway a multi-branched metabolic pathway that leads from carbohydrate precursors via shikimate to: (1) phenylalanine and tyrosine, via chorismate and prephenate (*see* **arogenate**); (2) tryptophan, via chorismate and anthranilate; (3) ubiquinone, plastoquinones, and tocopherols, via chorismate; (4) many naphthoquinones (including the vitamins K), 3-carboxy aromatic amino acids, salicylate, and dihydroxybenzoate (for enterobactin formation) via chorismate and isochorismate; and (5) certain non-aromatic cyclohexane compounds, via shikimate. The carbohydrate precursors are phospho-*enol*pyruvate and D-erythrose 4-phosphate; they yield 2-dehydro-3-deoxy-D-*arabino*-heptonate 7-phosphate (I, more commonly termed 3-deoxy-D-*arabino*-heptulosonate 7-phosphate, *abbr.*: DAHP) by action of EC 4.1.2.15, 2-dehydro-3-deoxyphosphoheptonate aldolase (DAHP synthase). I is converted to 3-dehydroquinone (II) by 3-dehydroquinone synthase, EC 4.6.1.3, and II is then converted to 3-dehydroshikimate (III) by 3-dehydroshikimate dehydratase, EC 4.2.1.10. Shikimate is then formed from III by **shikimate 5-dehydrogenase**, EC 1.1.1.25, and converted to shikimate 3-phosphate (IV) by **shikimate kinase**, EC 2.7.1.71. Phospho-*enol*pyruvate is used again to convert IV to 5-*enol*pyruvylshikimate 3-phosphate (V, *abbr.*: EPSP) by 3-phosphoshikimate 1-carboxyvinyltransferase, EC 2.5.1.19, and V yields chorismate (VI) by action of **chorismate synthase**, EC 4.6.1.4. Chorismate leads to prephenate by action of **chorismate mutase**, EC 5.4.99.5, and undergoes isomerization by isochorismate synthase, EC 5.4.99.6, to form isochorismate. Organization of the various enzymatic activities varies considerably in plants, bacteria, yeasts, and other fungi. In yeasts and other fungi, and also in *Euglena gracilis*, the conversion of DAHP to EPSP requires a complex pentafunctional polypeptide specified by the *arom* gene cluster (*see* **pentafunctional arom polypeptide**).

shikonin the (+)-(*R*) enantiomer of **alkannin**.

Shine-Dalgarno sequence a ribonucleotide sequence for the formation of the preinitiation complex between a 30S ribosomal subunit and an mRNA molecule. It is a seven-nucleotide, pyrimidine-rich sequence near the 3' terminus of 16S (prokaryotic) or 18S

eukaryote ribosomal RNA, found in many organisms, that forms base pairs with a complementary three- to seven-nucleotide, purine-rich sequence (the Shine–Dalgarno sequence) preceding the initiation codon in many mRNA molecules, thereby allowing the initiating ribosomal subunit to bind the mRNA so as to discriminate between AUG or GUG (i.e. initiation) triplets and to select the one at the beginning of a cistron. [After John Shine (1946–) and Lynn Dalgarno (1935–).]

SHIRPA a protocol for phenotype assessment designed to analyse behavioural changes in mice caused by **ENU mutagenesis**. The first four letters of the acronym are from the names of participating institutions in the UK.

shockate the preparation that is obtained when (bacterial) cells are suspended in an osmotically stabilizing medium and lysed by the sudden addition of water, followed by immediate centrifugation.

short-chain describing an aliphatic compound with a chain length of less than 10 carbons.

short-chain acyl-CoA dehydrogenase an enzyme that catalyses the following reaction in fatty-acid oxidation:

in which the acyl moiety (R) contains 4–6 carbon atoms. It is a homotetrameric flavoprotein of the mitochondrial matrix, with each subunit containing 388 amino acids). Several mutations lead to enzyme deficiency, which manifests in infancy as hypoglycemia, acidosis, hyperammonemia, and short-chain organic aciduria.

short interfering RNA *abbr.*: siRNA; a double-stranded RNA, 21–23 bp long, that can specifically silence gene expression. The most efficient gene silencing effect is given by having a 19 nucleotide region complementary to the mRNA and projections of two nucleotides at the 3' ends.

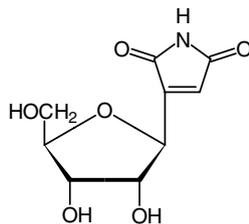

short-patch repair excision repair of DNA in which the excised DNA is about 20 nt long. It contrasts with **very-short-patch repair**, for mismatches between specific bases, and **long-patch repair**, in which stretches of ≈1500 nt or longer are involved. *See also* **DNA repair enzyme**, *uvr*.

shotgun cloning a method, first used for cloning an entire genome, in which the DNA is randomly broken into fragments of approximately the average size of genes. The fragments are then cloned into suitable vectors, to give a **genome library**.

shotgun collection *see* **genomic library**.

shotgun sequencing a strategy for sequencing whole genomes. Fragmented genomic DNA is cloned into a plasmid vector and randomly picked clones are sequenced using primers annealing to the plasmid. Sequences are compared and aligned using contig building software. Enormous computational power is required for sequencing large genomes in this way.

showdomycin 2-(β-D-ribofuranosyl)-maleimide; an antibiotic produced by *Streptomyces showdoensis* and active against several Gram-positive bacteria. It is used as a thiol-reactive agent. *Compare* **N-ethylmaleimide**.

shrimp alkaline phosphatase an enzyme that catalyses hydrolysis of 5'-phosphate from DNA (or RNA) regardless of whether the DNA has the 5' end protruding or recessed, or is blunt-ended.

shRNA *abbr.* for short-hairpin RNA.

shuttle an intracellular metabolic cycle concerned in the transfer of, e.g., reducing equivalents or carbon chains across membranes. Different carriers operate each way across the membrane. Examples include the **3-hydroxybutyrate cycle**, the **glycerol-3-phosphate cycle**, and the **malate–aspartate cycle**.

shuttle vector a DNA molecule, e.g. a plasmid, that can replicate in two different host organisms and can therefore be used to 'shuttle' or convey genes from one to the other.

shuttle vesicle an endocytotic vesicle that transfers proteins across an epithelial cell from one face to another e.g. from the sinusoidal to the bile-canalicular face of a hepatocyte.

sl *symbol* for a residue of the ribonucleoside thioinosine; mercaptopurine ribonucleoside (alternative to Sno).

Si *symbol* for silicon.

si- *stereochemical descriptor* denoting *sinister* (i.e. counterclockwise, or 'left-handed') configuration of face of a trigonal atom. *See* **Re/Si convention**.

SI *abbr.* for *Système International (d'Unités)*; International System (of Units); a rationalized coherent system of metric units, in which the magnitude of any physical quantity may be expressed, that is recommended for use by scientists throughout the world. It is based on seven **SI base units**: **ampere**, **candela**, **kelvin**, **kilogram**, **metre**, **mole**, and **second**. There are also 22 named **SI derived units**, which are expressed in terms of the base units, and two **SI supplementary units**, **radian** and **steradian**, which are regarded as dimensionless derived units. A series of prefixes signify decimal multiples and submultiples of any SI unit.

Sia *symbol* for the sialoyl group.

sial+ a variant of **sialo+** (before a vowel).

sialagogue or **sialogogue** any agent that stimulates the flow of saliva. —**sialagogic** or **sialogogic** *adj.*

sialate the anion of **sialic acid**.

sialic of, or relating to, saliva or a salivary gland.

sialic acid any of the *N*- or *O*-substituted derivatives of **neuraminic acid** found as components of complex carbohydrates, e.g. *N*-acetylneuraminic acid (5-(acetyl-amino)-3,5-dideoxy-D-glycero-D-galactonon-2-ulosonic acid, (*abbr.*: Neu5Ac; *see also* **NeuNAc**). Linkage of sialic acids is through C-2 to monosaccharides at the ends of glycosylation chains of glycolipids and glycoproteins. Neu5Ac can also be linked at its C-8 and C-9 hydroxyl groups to another Neu5Ac residue, often forming multiple repeats as in mammalian **NCAM**. Hydroxyl groups at C-4, -7, -8, and -9 can be *O*-acylated (*see also* **NeuOAc**). Other common derivatives are *N*-glycolylneuraminic acid (in mammals, but not normally in humans; *abbr.*: NeuGc), and **N-ketodeoxyoctanooylneuraminic acid** (e.g. in bacteria). Sialic acid accumulates in lysosomes in Salla disease and infantile sialic acid storage disease, and in cell cytosol in sialuria.

sialidase EC 3.2.1.18; *recommended name*: exo-α-sialidase; *former name*: neuraminidase; a glycosidase enzyme that hydrolyses 2,3-, 2,6-, and 2,8-glucosidic linkages joining terminal nonreducing *N*- or *O*-acylneuraminyl residues to galactose, *N*-acetylhexosamine, or *N*- or *O*-acylated neuraminyl residues in oligosaccharides, glycoproteins, or glycolipids.

sialidosis *another name* for **mucopolipidosis I**.

sialin or **anion and sugar transporter** (*abbr.*: AST); an integral protein (495 amino acids) of lysosomal membranes, that contains 12 transmembrane segments and permits hydron-driven exit of sialic acid (and glucuronic acid) into the cytosol. It is expressed mostly in cardiac and skeletal muscle, liver, kidney, brain, and placenta. Mutations result in the allelic **Salla disease** and infantile sialic acid storage disease.

sialo- or (before a vowel) **sial+** *comb. form* **1** of, or relating to, saliva or a salivary gland; **sialic**, **2** denoting the presence in a compound of one or more residues of sialic acid. *Compare* **asialo-**.

sialoadhesin a macrophage-restricted sialic-acid-dependent glycoprotein receptor of several forms. It contains 17 immunoglobulin-like domains. It is an adhesion molecule that recognizes oligosaccharides terminating in NeuAc(α2-3)Gal in N-linked and O-linked glycans.

sialogogue a variant spelling of **sialagogue**.

sialosyl the glycosyl group derived by removal of the exomeric hydroxyl group from sialic acid or sialate.

sialoyl the acyl group derived from sialic acid by removing the hydroxyl group from its carboxyl group.

sialuria a very rare, autosomal dominant disease in which coarse features, hepatosplenomegaly, and developmental delay accompany massive excretion of free sialic acid in urine. Sialic acid accu-

mutates in cell cytosol as a result of impaired regulation of sialic acid synthesis by **UDP-N-acetylglucosamine 2-epimerase** by the allosteric inhibitor CMP-sialic acid.

SIC *abbr.* for selenocysteine insertion complex.

sickle cell an abnormal red blood cell that contains mostly HbS or HbS and another hemoglobin variant. Such cells occur chiefly in **sickle-cell anemia** and in the sickle-cell trait. At low oxygen tensions such cells adopt a crescent shape reminiscent of the blade of a sickle. In HbS there is replacement of Glu by Val at position 6 in the hemoglobin β chain. In its deoxygenated state the HbS forms long rodlike helical fibres, which deform the red cells because the $\beta 6$ Val can pack into a pocket at the EF corner (between helices E and F) of another β chain, a pocket which is lost in conformational changes resulting from oxygenation.

sickle-cell anemia an inherited disease of humans caused by homozygosity for the gene for HbS (see **sickle cell**). It is particularly common in populations indigenous to or originating from the Mediterranean region, parts of Saudi Arabia and India, and in those of African origin. The resultant abnormal red blood cells, called **sickle cells**, are removed from the circulation at a faster rate than normal, leading to anemia. There is no satisfactory treatment, and early death often results. Heterozygotes have **sickle-cell trait**; these survive longer and benefit from greater resistance against the malaria parasite, which is adversely affected by sickle-cell trait during the red-cell phase of its life cycle. When the heterozygous sickle cells pass through capillaries, they sickle, causing them to lose K^+ and killing the malaria parasite, which needs high levels of K^+ . See also **glucose-6-phosphate dehydrogenase**.

side-by-side model *abbr.*: SBS model or SBS; a model of duplex DNA consisting of an alternating arrangement of right-handed and left-handed segments of duplex DNA, or other double-stranded polynucleotide, with five base pairs per segment. This produces a structure similar to the **Watson-Crick model of DNA** except that the two antiparallel strands are side by side rather than intertwined in a double helix.

side chain 1 any part of an organic molecule based on an aliphatic carbon chain that can be regarded as branching from a main chain. **2** the part of an amino acid that extends from the α -carbon atom, and is unique to that amino acid.

sideramine one of the categories of **siderochrome**. See also **sideromycin**.

siderochrome see **siderophore**.

sideromycin any iron-containing antibiotic compound elaborated by certain actinomycetes. Sideromycins are structurally related to sideramines (see **siderochrome**), which can antagonize their antibiotic action.

siderophage an alternative name for **siderophore D**.

siderophilin an alternative name for serotransferrin, serum **transferrin**.

siderophore or **siderochrome** any of various low-molecular-mass Fe(III)-chelating substances elaborated by aerobic or facultatively anaerobic microorganisms, especially when growing in iron-deficient media. Fe^{3+} -siderochrome complexes have very high stability constants (10^{30} – 10^{50} dm³mol⁻¹). They are taken up by specific transport proteins in the microorganisms; subsequent intracellular release of iron requires enzymic action. Siderophores are of two main categories, one or both of which may be formed by any particular organism: (1) catechol derivatives, e.g. **enterobactin**; and (2) hydroxamic acid derivatives, e.g. **mycobactin** (see also **ferrichrome**). The transport systems for ferrichrome or ferric enterobactin in certain strains of bacteria appear to be identical with the membrane receptors for colicin M or B respectively (see **colicin**), and in the former case for the antibiotic albomycin and various phages as well.

siderosome a membrane-bound organelle found in spleen macrophages. Siderosomes contain aggregates of **hemosiderin** and may be derived from **lysosomes**.

siemens *symbol*: S; the SI derived unit of **electric conductance**, defined as the electric conductance between two points on an electric conductor when an electric potential difference of one volt causes an electric current of one ampere to flow; i.e. $1\text{ S} = 1\ \Omega^{-1}$. It was formerly called the **mho** or the reciprocal ohm. [After (Ernst) Werner von Siemens (1816–92), German electrical engineer, industrialist, inventor, and metrologist.]

sievert *symbol*: Sv; **1** the SI derived unit of (radiation) **dose equivalent**, equal to one joule per kilogram of living tissue; i.e. $1\text{ Sv} = 1\text{ J kg}^{-1}$. Also, $1\text{ Sv} = 100\text{ rem}$. Compare **gray**, **2** or **intensity millicurie** an obsolete non-SI unit of intensity of gamma radiation, numerically equal to 8.4 röntgens per hour. [After Rolf Maximilian Sievert (1896–1966), Swedish radiation physicist.]

sieve tube exudate protein *abbr.*: STEP; any of numerous types of proteins present usually at low concentration in phloem exudates. They include enzymes of glycolysis, gluconeogenesis, and other aspects of carbohydrate metabolism, structural proteins (**P-proteins**), transcription factors, and lectins.

sievorptive chromatography a form of **chromatography** in which absorption and molecular-sieve properties are combined.

Si-face (of an atom or molecule) see **Re/Si convention**.

SIF cell *abbr.* for small intensely fluorescent cell.

sigma *symbol*: σ (lower case) or Σ (upper case); the eighteenth letter of the Greek alphabet. For uses see **Appendix A**.

sigma bond see **orbital**.

sigma factor an RNA polymerase initiation factor occurring in bacteria; a protein that promotes attachment of the RNA polymerase, of which it is a subunit, to specific initiation sites, and is then released. The main sigma factor of *Escherichia coli* is σ^{70} . An unrelated family is σ^{54} , with associated regulatory proteins; members of this are specific to certain operons. Other sigma factors are involved in response to heat shock and respiratory stress; examples from *E. coli* include σ^E and σ^{32} . Major switches in transcriptional control in bacteria, e.g. sporulation in bacilli, and transcriptional control in certain phages, involve modification to, or replacement of, sigma factors.

sigma orbital see **orbital**.

sigma receptor any receptor that is activated by powerful psychotomimetic drugs, e.g. **phencyclidine**. Sigma receptors appear to mediate disorientated and depersonalized feelings.

sigma subunit a component of bacterial RNA polymerase; see **sigma factor**.

sigmoid or **sigmoidal** S-shaped; especially as in a sigmoid flexure (e.g. of the large intestine); or a sigmoid plot, i.e. one similar to a skewed letter S, that is with slope increasing initially slowly, progressively increasing more rapidly, and then decreasing towards a plateau.—**sigmoidicity** *n*.

sigmoid kinetics (*in enzymology*) a type of kinetics of enzyme-catalysed reactions characterized by a sigmoid plot of rate versus substrate concentration. Such kinetics are characteristic of **allosteric** enzymes, in that progressive activation occurs with increasing substrate concentration due to **cooperativity** in binding of substrate. The presence of allosteric modifiers will alter the inflection of the curve, activators shifting it towards that found in Michaelis–Menten kinetics (see **Michaelis kinetics**).

signal 1 any variable property or parameter that serves to convey information. **2** the message potentially to be transmitted by any agonist interacting with a cell membrane receptor. **3** a **signal peptide**.

signalase see **signal peptidase**.

signal averaging a method used to improve **signal-to-noise ratios**, particularly in spectroscopy, by summing repeated scans of the information. The signals are thereby reinforced while the background noise tends to average out.

signal hypothesis a model, now largely substantiated, for the synthesis of secretory proteins on ribosomes bound to the rough **endoplasmic reticulum**. It holds that secretory proteins have mostly hydrophobic residues at the N terminus, which act as a signal to mediate binding to the ER membrane. It was proposed in 1971 by the US cytologist Gunter Blobel (1936–) and the US cell biologist David Domingo Sabatini (1931–), and by the Argentinian-born British biochemist César Milstein (1927–) and coworkers in 1972. See **signal peptidase**, **signal peptide**, **signal recognition particle**.

signalling molecule any molecule, e.g. **hormone**, **cytokine**, or **second messenger**, that cues the response of a cell to the behaviour of other cells or objects in its environment.

signal peptidase any endopeptidase that removes the **signal peptide** after passage of a protein through an endoplasmic reticulum (ER), mitochondrial, or chloroplast membrane. In prokaryotes there are two types: **1** signal peptidase I, EC 3.4.99.36; *recommended name*:

leader peptidase; *other name*: prelipoprotein signal peptidase; an endopeptidase that cleaves N-terminal signal peptides from secreted proteins and periplasmic membrane proteins. It is a single-pass protein of the inner membrane. **2** signal peptidase II, EC 3.4.99.35; *recommended name*: premurein-leader peptidase; an endopeptidase that selectively cleaves the signal peptide from bacterial membrane lipoproteins, hydrolysing the protein on the N-terminal side of a specific Cys residue.

In mammals, signal peptidases of the ER (EC 3.4.--) consist of: SPC 18 and SPC 21 (single-pass type I transmembrane proteins, each with a luminal serine endopeptidase domain); SPC 22/23 (a single-pass glycoprotein); and SPC 25 and SPC 12 (which span the membrane twice and have termini in the cytosol). Signal peptidases for processing proteins targeted to mitochondrial and chloroplast membranes are poorly understood.

signal peptidase II *see* premurein-leader peptidase.

signal peptide or **leader peptide** or **pre-part** or **prepeptide** or **piece** or **presequence** (def.1) or **signal** any sequence of amino-acid residues that, when linked to a newly synthesized protein, directs the protein to a location among the organelles of a eukaryotic cell, or from the cytoplasm to the periplasmic space of prokaryotic cells. The term originally applied to the N-terminal linked peptide of secretory proteins that is bound by the **signal recognition particle**, which transfers the ribosome to the endoplasmic reticulum. Such peptides usually comprise 20–30 amino-acid residues, and are characterized by a central region of hydrophobic amino acids preceded by one or more basic amino-acid residues. An interesting feature is that, at the junction of the signal peptide and the mature protein, there is no consensus sequence of amino-acid residues, so the basis for the specificity of the protease at this position remains unclear (*see* **signal peptidase**). The term signal peptide is now more generally applied to any peptide that is responsible for the location of a newly synthesized protein within the organelles of eukaryotic cells (*see* **protein kinesis**). Thus it applies to the mitochondrial proteins synthesized in the cytoplasm, nuclear proteins, and luminal proteins that are retained within the cisternae of the endoplasmic reticulum. In addition to the signal peptides described, which may be located either at the N terminus or C terminus of the nascent protein, and which are subsequently cleaved, single-spanning membrane proteins also contain a signal sequence within the protein known as a **stop-transfer sequence**. This serves to anchor the protein within the membrane. The orientation of the protein within the membrane may be either type I or type II, depending on whether the N terminus of the resulting protein is extracytoplasmic (type I) or cytoplasmic (type II). *See also* **signal recognition particle**.

signal peptide protease *abbr.*: SPP; a presenilin-type aspartic protease that catalyses intramembrane cleavage of some signal peptides after they have been removed from a preprotein. It is an integral membrane protein of the endoplasmic reticulum and contains seven transmembrane segments. In humans it generates signal sequence-derived lymphocyte antigen-E epitopes, which are recognized by the immune system.

signal recognition particle *abbr.*: SRP; a ribonucleoprotein particle of 325 kDa, composed of a 7S (300 nucleotide) RNA molecule and a complex of six different polypeptides. For proteins destined for the endoplasmic reticulum, as they emerge from the large ribosomal subunit, the SRP binds both to the N-terminal signal peptide and to the ribosome. This binding arrests further translation, preventing the proteins from being released into the cytosol. The SRP-ribosome complex then diffuses to the endoplasmic reticulum, where it is bound to the **signal recognition particle receptor**, which allows resumption of protein synthesis, and facilitates the passage of the growing polypeptide chain through the **translocon**. Through a process involving GTP hydrolysis, the SRP-SRP receptor complex dissociates, and SRP returns to the cytosol. Of the six polypeptides of SRP, the 54 kDa subunit (SRP54) is the central player. It contains an N-terminal GTPase domain and a C-terminal domain that binds directly to the signal peptide and the SRP RNA.

signal recognition particle receptor *abbr.*: SRP receptor; a transmembrane heterodimeric protein (α subunit, 69 kDa; β subunit, 30 kDa), also known as **docking protein**, located in the rough endoplasmic reticulum. Both subunits contain GTPase domains

with which **signal recognition particle** interacts. In the presence of GTP and SRP receptor, SRP is released from the ribosome-nascent chain complex. The α subunits have a negatively charged N-terminus and a positively charged but phosphorylated cytoplasmic tail (C terminus). *See also* **signal peptide**.

signal-to-noise ratio the proportional difference between the average values for a specific property under investigation (signal) and the average of nonspecific values (noise) in any record. *See also* **signal averaging**.

signal transduction the process by which an extracellular signal (chemical, electrical, or mechanical) is converted into a cellular response. Typically, interaction of a hormone, growth factor, or other agonist with a specific membrane receptor leads to signal amplification by synthesis within the cell of one or more **second messengers**, or to activation of other downstream cascades, e.g. by phosphorylation of proteins. Chemical agonists that cross the cell membrane (e.g. steroid hormones) produce a cellular response without such amplification of the signal. Electrical signals flowing down axonal membranes lead to release of neurotransmitters at synapses. Their plasma membrane receptors are similar to those for hormones and growth factors, or are ion channels. For phototransduction *see* **photosynthesis**, **visual cascade**.

signature *see* **pattern**.

signature database *an alternative name for* **pattern database**.

significant (*in statistics*) reaching a degree of **probability** that experimental values lie on a distribution different from that of control values, such that the investigator will conclude that experimental and control samples differ, using tests such as Student's *t*-test or the chi-square test. The degree of probability that will be accepted as indicating a significant difference depends on the type of investigation being conducted. If the tests indicate that the probability that the results are due to chance is $\geq 5\%$ (for biological or medical studies) or $\leq 1\%$ or, in some cases, $\leq 0.1\%$ (for biochemical studies), differences are considered significant. —**significance** *n*.

silaffin a peptide that is implicated in the biogenesis of diatom biosilica. Silaffins are rich in serine and lysine residues that are, respectively, phosphorylated and linked to long-chain polyamines. Silaffin-1A from *Cylindrotheca fusiformis* has the sequence (before modification): SSKKSGSYSGKSGK.

silane **1** monosilane; silicon tetrahydride; SiH_4 ; the silicon-containing analogue of methane. **2** any of a class of saturated silicon hydrides. Such compounds are silicon-containing analogues of alkanes or cycloalkanes; linear or branched silanes are of general formula $\text{Si}_n \text{H}_{2n+2}$, and cyclic silanes, termed cyclosilanes, are of general formula $[\text{SiH}_2]_n$ ($n > 2$). The value of n , when > 1 , may be indicated by a specific or general numerical prefix; e.g. disilane, cyclohexasilane, oligosilane, polysilane. Silane and disilane are gases with a repulsive odour; higher silanes are liquids or solids. Silanes are spontaneously flammable in oxygen or air. **3** *a term often loosely applied to* any hydrocarbyl or other derivative of a silane.

silanization treatment of a hydrophilic surface with a reactive **silane** (def. 3) such as dimethyldichlorosilane, trimethylchlorosilane, octyltrichlorosilane, or an octadecyltrialkoxysilane in order to render it more hydrophobic. Such a treatment is useful in particular for converting hydrophilic **silanol** (def. 4) groups on the surfaces of glassware or dried silica-gel particles into lipophilic alkylsiloxane moieties. When applied to glass, it reduces adsorption of polar compounds and minimizes the activation of lymphocytes, platelets, or other cells that can occur when untreated glass vessels are used; other benefits include promotion of drainage of aqueous liquids and minimization of electrical leakage (*see also* **siliconize**). Silanization has been applied to particles of dried silica gel for use in reversed-phase adsorption chromatography (*see also* **end capping**) and to diatomaceous earth used as the support for the stationary phase in reversed-phase liquid-liquid partition chromatography or in some variants of gas-liquid (partition) chromatography. *Compare* **silylation**. —**silanize** *vb.*; **silanized** *adj.*

silanol **1** silyl hydroxide; H_2SiOH ; the silicon-containing analogue of methanol. **2** any monohydroxy derivative of a **silane** (def. 2); such compounds are silicon-containing analogues of alkanols and are of general formula $\text{Si}_n \text{H}_{2n+1}\text{OH}$. **3** *a commonly used term for* any Si-hydrocarbyl derivative of silanol, silanediol, or silanetriol; such de-

derivatives are respectively of general formula R_3SiOH , $R_2Si(OH)_2$, or $RSi(OH)_3$. **4** the trivalent group $\rightarrow Si-OH$ occurring in hydrated silica (so-called silicic acid). Such groups occur also on the surfaces of dried silica-gel particles and of silica-based glasses under normal conditions (i.e. in equilibrium with undried air).

sildenafil *see* **Viagra**.

silent mutation or **synonymous mutation** or **same-sense mutation** a nucleotide substitution that does not result in an amino acid substitution in the translation product owing to the redundancy of the genetic code. The term 'silent' is also applied to a protein gene product arising from such a mutation, e.g. **silent hemoglobin**. *Other names*: silent site mutation; silent nucleotide change; silent polymorphism.

silent polymorphism *an alternative name for* **silent mutation**.

silica silicon(IV) oxide; silicon dioxide; SiO_2 ; a colourless or white solid used in many chromatographic procedures; silicic acid contains **silanol** (def. 4) groups to some of which water is bound. For chromatographic use, it is heated to 100 °C to drive out this water. Heating above 170 °C causes formation of oxide linkages ($Si-O-Si$), and at very high temperatures (800–1000 °C) it forms glass. Silicic acid is available in a variety of particle sizes. For chromatography, these range from 10 to 500 μm , the larger sizes being used for column chromatography at normal pressures, the smaller sizes for thin layer chromatography and high-pressure liquid chromatography. **Silica gel** is silicic acid precipitated as granules, about 3 mm diameter; it is hygroscopic and used as a drying agent, which can be re-used after heating. A powder of very fine silica particles, 0.007–0.014 μm , known as **fumed silica**, has thixotropic properties and has been used to create a gel in organic solvents, e.g. in scintillation cocktails to maintain hydrophilic materials in suspension during counting (now superseded by cocktails that themselves form a gel with water). Silica is found in certain algae, notably in the hard shell, or test, of diatoms (*see* **silaffin**); it also serves to reinforce the stems of the primitive vascular plants known as horsetails.

siliceous or **silicious** of, pertaining to, or containing silica.

silicone any oligomeric or polymeric **siloxane** containing the repeating structural unit $-O-SiR_2-$, where R is a hydrocarbyl (e.g. methyl or phenyl) group. The molecule is usually linear, but can be branched, crosslinked, or cyclic. Silicones are odourless and generally colourless, and are characterized by high hydrophobicity and by remarkably high chemical and thermal stability. Silicones may be oils, greases, gums, elastomers, or resins, and have a wide range of clinical, electrical, engineering, industrial, and laboratory applications. In commercial usage, the term often includes organosilicon compounds used for **silanization** and **silylation**.

siliconize to render (filter-paper, glassware, textiles, etc.) water-repellent by application of a coating of an appropriate silicone. *See also* **silanization**. —**siliconized** *adj.*; **siliconizing** *n.*

siloxane any saturated silicon-oxygen hydride with unbranched or branched chains of alternating silicon and oxygen atoms in the molecule. Unbranched siloxanes are of general formula $H_3Si-[O-SiH_2]_n-SiH_3$; each is named after its parent **silane** (def. 2), e.g. disiloxane ($n = 0$), tetrasiloxane ($n = 2$). Hydrocarbyl derivatives are commonly included. *See also* **silicone**.

silver staining a sensitive method for detecting protein in polyacrylamide gels. Silver ions are reduced to metallic silver in the presence of the developing reagent, formaldehyde, in a reaction promoted by the protein. Amounts of less than 1 μg of protein can be detected. A modification of the protocol can be used for the sensitive detection of DNA in polyacrylamide gels.

silyl 1 H_3Si- , the group derived from **silane** (def. 1) by loss of a hydrogen atom. **2** any hydrocarbyl derivative, R_3Si- , of the **silyl** (def. 1) group.

silylation the process of converting an organic compound into its **silyl** (def. 2) derivative by attachment of trimethylsilyl (or similar organosilicon) groups. Reagents frequently used are trimethylchlorosilane and 1-(trimethylsilyl)imidazole, although others have particular applications. Reactive compounds include those possessing amino, carboxyl, hydroxyl, or thiol groups, for which silylation affords selective protection during synthetic work (*see* **protecting group**). Silylation is widely used for conversion of mixtures of related compounds into derivatives capable of separation

and analysis by gas chromatography/mass spectrometry. *Compare* **silanization**. —**silylate** *vb.*; **silylator** *n.*; **silylated**, **silylating**, **adj.**

simian characteristic of, resembling, or belonging to the apes.

simian immunodeficiency virus *abbr.*: SIV; a lentivirus, common in the sooty mangabey (a type of monkey) and many African green monkeys. SIV_{SM} is closely related to – and probably gave rise to – HIV-2 (*see* **HIV**). HIV-1 is closely related to SIV from chimpanzees. Infection of sooty mangabeys and African green monkeys does not cause disease, but SIV infection occurs in macaques in captivity and is pathogenic.

simian virus 40 *abbr.*: SV40; an icosahedral virus containing circular duplex DNA of about 5.2kb associated with four histones (H4, H2A, H2B, H3) in a minichromosome. It infects monkeys and apes and induces tumours in other species, its DNA being integrated into the host genome. It has two types of life cycle: in permissive cells (usually monkey permanent cell lines) replication occurs in normal infection; in nonpermissive cells there is no lytic infection, but growth transformation can occur. The virus is useful as an **expression vector** in recombinant DNA technology, having good promoter properties: it can be used either as a virion or as a construct maintained transiently in host cells at high copy number in unintegrated plasmid-like DNA molecules. *See also* **small T-antigen**.

similarity (*in bioinformatics*) the extent to which biopolymeric sequences share identical or related characters (nucleotides or amino acids) at equivalent positions, usually expressed as a percentage. For protein sequences, the degree of relatedness of amino acids is quantified in substitution or mutation matrices – e.g. PAM (point accepted mutation), BLOSUM – allowing similarity scores to be assigned in pairwise comparisons.

similarity matrix *see* **scoring matrix**.

simple diffusion or **passive diffusion** a type of **diffusion** (def. 2) across a membrane in the absence of any specific transporting agent or carrier. *Compare* **facilitated diffusion**, **active transport**.

simple radial immunodiffusion *see* **single radial immunodiffusion**.

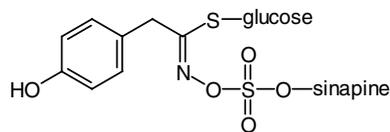

simple sequence repeat *abbr.*: SSR; a DNA sequence comprising repeats of identical or highly similar short motifs. SSRs are polymorphic and include minisatellites, microsatellites, and nontandem motif arrangements (the latter are called **cryptically simple sequences**). SSRs are ubiquitous in the human genome and account for at least 0.5% of genomic DNA.

SIMS *abbr. for* secondary ion mass spectrometer.

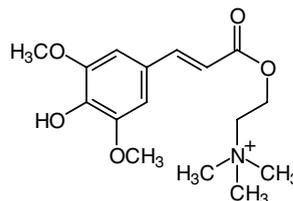

sin *abbr. for* sine.

Sin 3 a mammalian nuclear protein that contains four paired amphipathic helix domains and associates with two histone deacetylases, retinoblastoma protein-binding proteins, p53, BRCA1, c-Ski, and possibly other proteins.

sinalbin a glucoside found in white or yellow mustard. *See also* **sinapine**.

sinapine 2[[3-(4-hydroxy-3,5-dimethoxyphenyl)-1-oxo-2-propenyl]-oxy]-*N,N,N*-trimethylethanaminium; a component of **sinalbin**; it is also found in black mustard and other seeds.

sinaptobrevin a variant spelling of **synaptobrevin**.

sine *abbr.*: sin; a trigonometric function, being the ratio of the side of a right-angled triangle opposite a given angle to the hypotenuse; the sine of an obtuse angle is numerically equal to that of its supplement.

SINE *abbr.* for short interspersed nucleotide element; a highly repeated sequence of DNA occurring interspersed in a mammalian genome; it is similar to a **LINE** but is shorter – typically less than 500 bp long. The major SINE in the human genome is the **Alu sequence**. SINES appear to be processed **pseudogenes** derived from genes that encode small cytoplasmic RNAs including tRNAs. Thus the sequences of SINES are often homologous to the sequences of such RNAs.

Singer-Nicholson model an alternative name for **fluid-mosaic model**.

single-cell protein *abbr.*: SCP; a protein-rich material produced by the culture of bacteria, yeasts, other fungi or algae, and extracted for use as a protein supplement in animal or human foods.

single-copy plasmid a plasmid that replicates at the same pace as the bacterial chromosome, and thus maintains equality in numbers with the chromosome.

single nucleotide polymorphism *abbr.*: SNP; a single nucleotide position in a genome sequence at which alternative alleles are present at an appreciable frequency within a population. SNPs are important in biomedical research because they can be used as markers for disease-associated mutations, and may account for the variations in individual responses to bacteria, viruses, toxins, and drugs.

single-pass (*in protein biochemistry*) describing an integral membrane protein that contains only one transmembrane segment. *Compare multipass.*

single radial immunodiffusion or **Mancini method** an immunodiffusion technique in which holes (wells) are cut in a sheet of antibody-containing agar in a glass dish or on a slide. The wells are filled with antigen solution, which is then left to diffuse radially outwards; in doing so, it reacts with antibody to form a ring of precipitate. The diameter of the circle of precipitate is proportional to the concentration of antigen.

single-spanning describing an integral membrane protein having a single hydrophobic sequence embedded in the membrane lipid bilayer. Such a sequence anchors the protein in the membrane.

single-strand binding protein *abbr.*: SSB protein; any of a group of proteins found in bacteria and mitochondria that have a greater affinity for **single-stranded DNA** than for double-stranded species. They are essential for replication, recombination, and repair. They bind tightly and cooperatively, and do not catalyse associated activities, such as the DNA-dependent ATPase activities of **helicases** and **topoisomerases**. They have been called 'unwinding', 'melting' and 'helix-destabilizing' proteins, but each of these names is rather misleading, as these proteins have multiple functions.

single-strand conformation polymorphism analysis *abbr.*: SSCP analysis; a method for detecting mutations by the rate at which single-stranded DNA migrates on electrophoresis gels, under conditions in which the conformation adopted by the DNA is critical. The technique involves amplification of a DNA sequence of interest using the **polymerase chain reaction** (PCR); the DNA is denatured to form single strands and then applied to the gel under non-denaturing conditions. The three-dimensional conformation adopted by ssDNA is sequence dependent and sensitive to single base changes, and this in turn affects the rate of migration in the gel. Wild-type DNA produces two bands of characteristic mobilities that act as references with which to compare the rate of migration of DNA containing a mutation or polymorphism. Heterozygotes characteristically produce four bands on the gel, two from the wild-type allele and two from the mutant or polymorphic allele.

single-stranded DNA *abbr.*: ssDNA; a form of **DNA** consisting of a single chain of deoxyribonucleotides. ssDNA occurs naturally in certain circumstances: (1) transiently, during replication (*see replicate*), when the duplex helical molecule of double-stranded (ds) DNA is unwound in the replication fork, initiated by **helicase**; (2) during replication of circular DNA, when in some circumstances only one strand is replicated, yielding a single-stranded product; as replication proceeds, the synthesized DNA unwinds as a single-

stranded 'tail'. Replication may proceed around the unbroken circular DNA strand for more than one cycle, giving rise to the term **rolling circle**; (3) in certain filamentous **coliphages**, such as M13, f1, and fd, which contain a single-stranded circular DNA molecule.

singleton (*in gene sequencing*) a nucleotide sequence that has no overlaps with other fragments at a given stringency and is not therefore contained in any fragment assembly for a given gene.

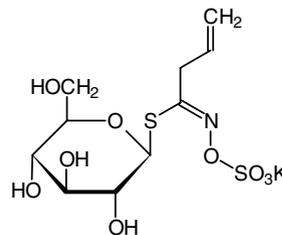

singlet oxygen a dioxygen molecule in which two 2p electrons have similar spin. It is more highly reactive than the form in which these electrons are of opposite spin. Singlet oxygen is produced in chloroplasts that, due to mutation, lack carotenoids; excited triplet chlorophyll reacts with oxygen to yield singlet oxygen, which is normally quenched by carotenoids. In the absence of carotenoids, lethal photodynamic damage occurs.

single-turnover kinetics the kinetics of an enzyme-catalysed reaction in conditions under which formation of the enzyme-substrate complex can be measured. Such conditions are required for the detection and analysis of transient enzyme-substrate and enzyme-intermediate forms in the pre-steady state (*see pre-steady state kinetics*), and contrast with measurement of the multiple recycling of the enzyme in the steady state. Although the reaction is proceeding normally, only the first part is studied, leading to the expression 'single-turnover conditions'. In this kind of study, a substrate is chosen for which the enzyme-substrate complex can be distinguished from substrate alone, e.g. by having a different absorption spectrum. The rate of formation of the complex can then be determined, often by stopped-flow methods.

singly labelled describing a **specifically labelled** compound containing only one isotopically modified atom in a uniquely specified position, e.g. CH₃-CH[²H]-OH.

Sin 3-HDAC *abbr.* for Sin 3-histone deacetylase; a protein complex that in mammals consists of **Sin 3**, two histone deacetylases (HDAC 1 and 2), two retinoblastoma-associated proteins (RbAp46 and RbAp48), and two Sin 3-associated proteins (SAP18 and SAP30)

sinigrin 1-thio-β-D-glucopyranose 1-[N-(sulfo-oxy)-3-butenimide] monopotassium salt; a β-D-thioglucoside occurring in mustard seeds and horseradish roots; it is used as a substrate for thioglucosidase.

sinister *Latin* left; used to describe the left, or counterclockwise, configuration of one of the two faces of a compound containing a trigonal carbon atom. It is designated by the prefix *si-*. *Compare rectus.* *See also Re/Si convention.*

sintered glass or **frit** small particles of glass that have been heated so that they just fuse but without extensive melting. The resultant material is porous, and is often used in glass filtration apparatus or as a support to retain packing materials in chromatographic columns.

Sir *abbr.* for silent information regulator; any of a family of highly conserved NAD-dependent histone/protein deacetylases, present in nearly all living cells, that catalyse the reaction:

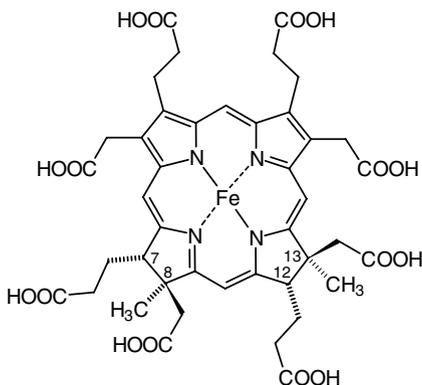

In bacteria, Sir-2 controls acetyl-CoA synthetase by deacetylating a residue in the active site. In yeast it is involved in gene silencing, chromosomal stability, and ageing. Sir-2-like proteins are called *sirtuins*. Seven homologues (SIRT1 to SIRT7) occur in humans.

sirna a bioinformatics computer program used for the design of siRNA duplexes.

siRNA *abbr.* for small interfering RNA; a form of microRNA (miRNA) that associates with RNA helicase and RNase molecules to form a complex called **RISC**. The siRNA then unwinds and directs precise, sequence-specific degradation of mRNA. siRNAs are 21–23 bp long, generated by **Dicer** from a dsRNA precursor, and are highly specific for the nucleotide sequence of their target mRNA. They require **Argonaute** to function.

siroheme or (*esp. Brit.*) **sirohaem** a heme molecule discovered in bacterial sulfite reductase, EC 1.8.99.1. It is a tetrahydroporphyrin, having adjacent, reduced pyrrole rings. It is also a component of nitrite reductase (EC 1.6.6.4) from *Nitrobacter*.

siroheme synthase or (*esp. Brit.*) **sirohaem synthase** a multifunctional bacterial protein that contains **uroporphyrin-III C-methyltransferase**, **ferrochelatase**, and precorrin-2 oxidase activities. The latter activity converts precorrin-2 into **siroheme** by oxidation and Fe²⁺ chelation.

sirtuin *see* Sir.

sirup a variant spelling (*esp. US*) of **syrup**.

sis an oncogene (*v-sis*) from simian osteosarcoma virus that is also expressed in human connective tissue tumours. The protooncogene, *c-sis*, encodes the B chain of **platelet-derived growth factor** (PDGF), and *v-sis* encodes an almost identical B chain, differing only in the amino acids at its N and C termini. Cells transformed by *v-sis* produce the B chain, which stimulates the PDGF receptor in an autocrine fashion.

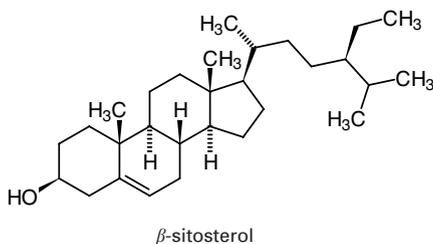

site-directed mutagenesis or **site-specific mutagenesis** the use of cDNA technology to generate a **point mutation** at a predetermined position in a gene. It may be achieved in a number of ways but is commonly performed by **oligonucleotide-directed mutagenesis**.

site-1 protease *see* SP1.

site-2 protease *see* SP2.

site-specific DNA methyltransferase *see* DNA methylase.

sitosterol 22,23-dihydrostigmasterol; a widely distributed plant sterol related to **stigmasterol**.

SI units *see* SI.

SIV *abbr.* for simian immunodeficiency virus.

six-frame translation (*in sequence analysis*) translation of a DNA sequence taking into account the three possible reading frames in

each direction of the strand, giving rise to three forward and three reverse translations.

six-loop-six structure the topology of an integral membrane protein in which six N-terminal transmembrane segments are separated from six segments in the C-terminal region by a hydrophilic loop. It is characteristic of many transporters in eukaryotes and prokaryotes.

sizing column a **gel-filtration** column that is used to provide information about the M_r (size) of proteins.

sizing gel a **gel-filtration** medium, especially one used in a sizing column.

sizukacillin *see* **peptaibopol**.

Sjl protein *abbr.* for synaptojanin-like protein; any of three proteins of yeast that have phosphatidylinositol-5-phosphatase activity: Sjl1p (946 amino acids); Sjl2p (1183 amino acids); and Sjl3p (1107 amino acids). The first two seem to function in endocytosis.

Sjögren-Larsson syndrome an autosomal recessive disorder in which congenital ichthyosis is associated with mental retardation, retinopathy, spastic diplegia or tetraplegia, and accumulation of fatty alcohols in tissues. It results from mutations that cause deficiency of the enzyme fatty aldehyde:NAD⁺ oxidoreductase. [After Torsten Sjögren (1859–1939), Swedish physician, and Tage Konrad Leopold Larsson (1905–), Swedish scientist.]

Sjögren syndrome an autoimmune disease, usually of middle-aged women, in which lymphocytes infiltrate and destroy salivary and lacrimal glands, and autoantibodies for several ribonucleoproteins appear in serum. It is often associated with other autoimmune diseases. [After Henrik C. Sjögren (1899–1986), Swedish ophthalmologist.]

S2 kallikrein *see* **tonin**.

SKALP *abbr.* for skin-derived antileukoproteinase; *other name* elafin; a serine protease inhibitor; it probably inhibits elastase-mediated tissue proteolysis.

skatole 3-methylindole; a bacterial metabolic product of indoleacetic acid that contributes to the odour of feces.

skeletal growth factor a protein that stimulates bone growth. Skeletal growth factor from human bone (hSGF) stimulates growth in human bone cells and embryonic chick bones in culture. The activity involves **insulin-like growth factors** (IGFs) in association with IGF-binding proteins (IGFBPs).

skeletin (*formerly*) an *alternative name* for **desmin**.

skeleton 1 (*in zoology*) any structure that provides support and protection for the soft tissues and organs of the body. An **exoskeleton**, such as the cuticle in arthropods, lies external to the body tissues, while an **endoskeleton**, such as the bony or cartilaginous skeleton of vertebrates, lies within the body. **2** (*in chemistry*) the carbon chain of a molecule, including any noncarbon elements that necessarily link carbon moieties of the chain. —**skeletal adj.**

skew 1 asymmetric, biased, distorted. **2** oblique, slanting. **3** (of a statistical distribution) not symmetrical about the mean. **4** to become or make skew; to distort. *See also* **skew conformation**. —**skewness n.**

skew conformation 1 any conformation of a six-membered ring form of a monosaccharide or monosaccharide derivative when three adjacent ring atoms and the remaining nonadjacent ring atom are coplanar. Such compounds may be designated by the conformational descriptor -S added to the name. The reference plane is so chosen that the lowest-numbered carbon atom in the ring, or failing that the atom numbered next above it, is exoplanar. Skew conformation is the median conformation through which one **boat conformation** passes during conversion to another boat conformation in the cycle of flexible forms; it is similar to **twist conformation** (def. 1). *See also* **conformation 2** a *less common alternative term* for synclinal conformation; *see* **conformation**.

Ski *abbr.* for super killer; any of a group of yeast cytoplasmic proteins that normally repress translation of an endogenous RNA virus. When Ski protein is mutated, a super killer phenotype results from overexpression of a toxin by the virus. Ski2p, Ski3p, Ski7p, and Ski8p are associated with the exosome core in the cytoplasm.

SKI a gene related to *v-ski*, the oncogene of Sloan-Kettering viruses; it has no marked homology with other oncogenes. It does not bind DNA but interacts with a histone deacetylase complex, Sin3, and Smads 2 and 3.

slab gel a gel, usually polyacrylamide or starch, that is formed as a sheet rather than a rod.

slaty a coat colour mutation in mice allelic for the *tyrp-2* gene that causes dark-grey (slate-coloured) melanin to be formed. The enzyme affected is **dopachrome Δ -isomerase**.

SLC *abbr.* for solute carrier; any member of the solute carrier gene series, which currently comprises 43 families and 298 transporter genes. SLC7A7, for example, is a gene for the cationic amino acid carrier light chain belonging to family SLC7.

sleep peptide any peptide that brings about sleep when infused into the cerebrospinal fluid (CSF) of animals. Delta-sleep-inducing peptide, isolated from CSF, has the structure Trp-Ala-Gly-Gly-Asp-Ala-Ser-Gly-Glu. A large number of endogenous substances isolated from the brain can likewise induce sleep, but it is not known if this is their physiological function.

sliding clamp *an alternative name for* proliferating cell nuclear antigen. *See* PCNA.

sliding filament model a model of muscle contraction in which contraction results from **thin filaments** sliding past **thick filaments**. The activation involves enhanced binding of Ca^{2+} by troponin C (*see* **troponin**) associated with the thin filament. In the resting state, troponins I and T inhibit the actin-tropomyosin complex of the thin filament from binding to myosin; increase in Ca^{2+} concentration causes troponin C (each molecule of which binds up to four Ca^{2+} ions) to release this inhibition, allowing the myosin head-groups to bind actin. Then, in the presence of ATP, the thin filaments slide over the thick filament myosin molecules to cause contraction. The ATPase of myosin heads hydrolyses the ATP; the latter must be continuously produced for contraction to continue.

sliding 1 the mode of action of **lac repressor** in *Escherichia coli*. It first binds at a non-operator site, then slides along the DNA until it finds the target site, i.e. the **operator**. **2** the displacement of a nucleosome along a track of DNA. *See* **sliding clamp**, **sliding filament model**.

slime mould *or* (*US*) **slime mold** any of a group of organisms that exhibit features of both fungi and protozoa. Characteristically they exist as slimy masses on decaying wood or in damp soil, and have the ability to switch from an amoeboid single-celled phase, called a **myxamoeba**, to an aggregated or multicellular phase from which fruiting bodies may arise. In the so-called **true slime moulds**, the myxamoebae form an acellular mass called a plasmodium, whereas in the **cellular slime moulds** the myxamoebae aggregate to form a multicellular pseudoplasmodium, or 'slug'. A well-known example of a cellular slime mould is *Dictyostelium discoideum*; when the food supply is exhausted, its myxamoebae aggregate to form a small (1–2 mm) slug, containing up to 10^5 cells, which migrates to seek an area of food abundance. When nutritional conditions are favourable the slug undergoes differentiation to form fruiting bodies, from which spores are released. Germination of a spore leads to the formation of a myxamoeba. *D. discoideum* has a relatively small genome (about 10 times larger than that of a bacterium) and is popular with geneticists, providing insights into the nature of the inducible behaviour leading to aggregation, and the rapid cell division and differentiation that precede the formation of a fruiting body.

slip a term used for situations in which the mitochondrial enzyme, **cytochrome c oxidase**, may carry out its reaction without pumping protons into the intermembrane space.

slit one of a group of proteins, secreted by cells at the midline in the *Drosophila* embryo, that binds to a **Robo** receptor on growth cones of axons and prevents them from crossing the midline. Slit proteins are also present in non-neuronal tissues.

slope $\delta y/\delta x$, where results are expressed graphically as a continuous line, the ordinate (vertical axis) representing y , the abscissa (horizontal axis) representing x .

slow-cycling rhodopsin a retinal-containing, energy-transducing pigment present in small amounts in some of the strains of *Halobacterium halobium*, in which purple membranes occur. It is distinct from **bacteriorhodopsin** and **halorhodopsin**, and is believed to play a role in the characteristic variation in the phototactic response of such organisms at different wavelengths. Illumination with yellow light, or with blue or near-ultraviolet light, results respectively in accumulation of forms with absorption maxima at 375 nm and 590 nm.

slow reacting substance (of anaphylaxis) *or* **slow reacting sub-**

stance **A** *abbr.*: SRS *or* SRS-A; a substance that mediates anaphylaxis; it was identified as a polar, lipid-like compound synthesized in mammalian tissues as a consequence of the combination of antibody with antigen. It increases vascular permeability and induces contraction of some types of smooth muscle, especially bronchial muscle. It is slow in action relative to histamine – hence its name – and is not antagonized by antihistamines. **Leukotrienes C₄, D₄, and E₄** are the active components.

SLP-76 *abbr.* for SH2-containing leukocyte protein 76 kDa; an adaptor protein involved in platelet degranulation, secretion of interleukin 2, and formation of lymphatic vessels. It is phosphorylated on tyrosine residues by **Syk**.

slurry a fluid suspension of particles having the consistency of cream.

Sly syndrome *see* **mucopolysaccharidosis VII**.

Sm symbol for samarium.

Sma I a type 2 **restriction endonuclease**; recognition sequence CCC↑CGG.

Smac *abbr.* for second mitochondria-derived activator of caspases. *See* **Diablo**.

Smad any of several proteins that act as transcription factors. The name is derived from a fusion of the gene names *sma* (in *Caenorhabditis elegans*) and *Mad* (in *Drosophila*). Smads fall into one of three classes: (1) receptor-regulated (R-Smads: 1, 2, 3, 5, and 8); (2) common-partner (Co-Smads: 4 and 4 β); and (3) inhibitory (I-Smads: 6 and 7). R-Smads and Co-Smads share two highly homologous sequences in the N-terminal and C-terminal regions: one is important for complex formation, regulation of transcription, and interaction with receptor serine/threonine protein kinases (e.g. bone morphogenetic protein receptors); the other binds DNA and associates with other transcription factors. R-Smad-Co-Smad dimers enter the nucleus following activation by ligand binding to the receptors.

small cytoplasmic ribonucleoprotein *abbr.*: scRNP; *other name*: 'scryp'; any particulate complex of proteins with molecules of **small cytoplasmic RNA**, found in the cytoplasm. The function of scRNPs is unknown.

small cytoplasmic RNA *abbr.*: scRNA; any of various low-molecular mass RNA molecules (100–300 nt) found in the cytoplasm as components of **small cytoplasmic ribonucleoprotein**.

small Hsp one of a family of small heat-shock proteins. Like the alpha-crystallin family they consist of 12- to 43-kDa proteins. They tend to form large multimeric complexes. Their chaperone activity is confined to the binding of unfolded intermediates, thereby protecting them from irreversible aggregation. Unlike Hsp70 and Hsp90, the function of small Hsp is not dependent on ATP.

small intensely fluorescent cell *abbr.*: SIF cell; a cell found in autonomic ganglia and containing dopamine. The name derives from the appearance of such cells after formaldehyde condensation in fluorescence microscopy.

small leucine rich proteoglycans a group of small interstitial proteoglycans which have a high degree of homology in their protein core sequence. Each has between 10 and 12 highly conserved leucine rich tandem repeats which makes up the central portion of the core protein. The current members of the group are **fibromodulin** and **lumican**, which are both keratan sulphate substituted, and **decorin** and **biglycan** which are both chondroitin sulphate substituted.

small modulating RNA *abbr.*: smRNA; small (~20 bp) noncoding double-stranded RNAs with possible functions in regulating cell-type-specific gene expression.

small nuclear ribonucleoprotein *abbr.*: snRNP (hence often colloquially termed 'snurp'); any of various particulate complexes of proteins with molecules of **small nuclear RNA** (snRNA), found in the eukaryotic nucleus; the particles are ~250 kDa. They are named according to the snRNAs they contain: the U4/U6 snRNP, e.g., contains U4 and U6 snRNA. They are involved in RNA splicing (*see* **spliceosome**). Patients with systemic lupus erythematosus make antibodies directed against one or more snRNPs.

small nuclear RNA *abbr.*: snRNA; any of the RNA molecules (100–300 nt) that contain a uridine-rich region, are designated U1, U2, ... U12 RNA, and are found in the eukaryotic nucleus as com-

ponents of **small nuclear ribonucleoprotein**. See **Sm protein, spliceosome**.

small nucleolar ribonucleoprotein *abbr.*: snoRNP (hence often colloquially termed 'snorp'); any of various particulate complexes of proteins with molecules of **small nucleolar RNA**, found in the eukaryotic nucleolus. They are possibly the same as **processosomes**.

small nucleolar RNA *abbr.*: snoRNA; any small RNA that is associated with the eukaryotic nucleus as a component of **small nucleolar ribonucleoproteins** and participates in the processing of ribosomal RNA in cell nuclei. snoRNAs have a long stretch of sequence complementarity to conserved sequences in mature mRNA. Six have been identified in metazoan cells (87–280 bases) and 12 in yeast (125–605 bases). They seem to assemble with a large multi-RNA RNP complex.

small serine proteinase inhibitor *see* **smapin**.

small T-antigen *see* **T-antigen** (def. 1).

smapin *abbr.* for small serine proteinase inhibitor; any protein (up to 100 amino acids) of nematodes that contains five disulfide bonds and inhibits serine proteinases.

S₁ mapping or **S₁ nuclease mapping** a technique based on the ability of **S₁ nuclease** to remove single-stranded (ss) DNA or ssRNA from DNA/RNA hybrids. It has been used to detect coding regions in DNA that has been hybridized – with cDNA for a particular mRNA or the mRNA itself – since any ssDNA formed by introns is removed by the S₁ nuclease leaving only the coding DNA. The enzyme can be used similarly to identify the 5' end of a mRNA.

SMART *abbr.* for simple modular architecture research tool; *see* **derived database**.

Smc *abbr.* for structural maintenance of chromosomes; any of a family of proteins involved in binding to and separation of sister chromatids during the cell cycle. Smc1 and Smc3 are components of the **cohesin** complex. Smc2 and Smc4 are components of the **condensin** complex.

SMCC *abbr.* for SRB- and MED-containing cofactor complex; a multiprotein complex (1.5 MDA, ≈25 polypeptides) that contains several homologues of components of the yeast transcriptional coactivator mediator. Its subunit composition is almost identical to that of **TRAP**.

SmcX a protein encoded on the X chromosome that escapes X-chromosome inactivation in mouse and human. It belongs to the ARID family of DNA-binding regulatory proteins (*see* **ARID protein**). A homologue (called **SmcY**) is encoded on the Y chromosome.

SmcY a protein encoded on the Y chromosome that is homologous to **SmcX**. It belongs to the ARID family of DNA-binding regulatory proteins (*see* **ARID protein**). In mouse, it is essential for expression of male-specific minor histocompatibility antigens.

smectic (of a substance) being or having a **mesomorphic** state in which the molecules are arranged in parallel layers. The molecules in any layer can move in the plane of that layer but not into adjacent layers. *Compare* **nematic**. *See also* **liquid crystal**.

smectic mesophase *see* **liposome, liquid crystal**.

Smith-Waterman alignment algorithm (*in sequence analysis*) a global dynamic programming algorithm optimized for local alignment. A modification of the **Needleman-Wunsch alignment algorithm**, it aligns similar segments of sequence pairs and exploits a substitution matrix with negative values (otherwise, if non-negative values are used, it behaves as a global alignment algorithm). *See* **alignment algorithm**.

SMN protein *abbr.* for survival motor neuron protein; a protein (294 amino acids) that is widely expressed in cell nuclei, where it interacts with components of the spliceosome. Mutations, including gene deletions, cause autosomal recessive spinal muscular atrophy.

smooth describing a bacterial strain having shiny (smooth) colonies. *See* **smooth-rough variation**.

smooth endoplasmic reticulum *abbr.*: SER; *see* **endoplasmic reticulum**.

smooth muscle or **involuntary muscle** muscle that lacks striations, hence giving a 'smooth' appearance under the microscope; it produces slower, longer lasting contractions than **striated muscle** and is present in visceral organs such as stomach, bladder, intestine, and uterus, and the walls of arteries. The cells are mononucleate, and contain both **thick filaments** and **thin filaments** but not in the pattern

that leads to striations. Contraction is regulated by the sarcoplasmic (cytosolic) free Ca²⁺ concentration, which increases from resting levels of 120–270 nM to 500–700 nM in response to stimuli such as membrane depolarization, or α -adrenergic or muscarinic agonists. Ca²⁺ bound to calmodulin activates **myosin-light-chain kinase**, which phosphorylates myosin at Ser¹⁹ of each of the two 20 kDa light chains. This causes cycling of myosin cross-bridges along actin filaments and the development of force (*see* **sliding filament model**). **Calponin**, **caldesmon**, and **protein kinase C** may also play a role in fine-tuning the contractile state.

smooth-rough variation or **S→R variation** any type of cell-surface variation that occurs in bacteria, usually changing the appearance of colonies from that of the original. In the Enterobacteriaceae the colonies are typically shiny (smooth) and change to matt (rough), an S→R variation that may be accompanied by loss of surface antigens, reduction or loss of virulence, and changes in susceptibility to certain bacteriophages.

Sm protein any of a family of proteins that participate in splicing of pre-mRNA. Seven members assemble into a ring, their inner surface binding the uridine-rich region of small nuclear RNAs that are shared among small ribonucleoproteins.

smRNA *abbr.* for small modulating RNA.

SMRT *abbr.* for silencing modifier of retinoid and thyroid hormone; a protein that binds **NCoR** and unliganded receptors for retinoic acid and thyroid hormone. This complex then binds the histone deacetylase complex **Sin 3-HDAC**, which represses transcription.

sn- prefix signifying stereospecifically numbered; it is used in designating the configuration of derivatives of prochiral compounds (especially glycerol and its derivatives) to ensure differentiation from conventional numbering. Thus sn-1 denotes C-1 of the glycerol moiety of a phospholipid under the **stereospecific numbering** system. C-2 and C-3 are similarly denoted *sn*-2 and *sn*-3.

Sn symbol for tin.

SNAP *abbr.* for 1 *S*-nitroso-*N*-acetylpenicillamine. 2 synaptosome-associated protein; a number of these exist. The nomenclature has become somewhat confusing, since SNAPs exist with different but closely related roles. Thus SNAP-25 functions as a SNAP receptor, or **SNARE**, while other SNAP proteins such as α -SNAP (*see* def. 3) function to bind NSF proteins (*see* **N-ethylmaleimide**) to SNAREs such as SNAP-25. 3 soluble NSF attachment proteins, such as α -SNAP, β -SNAP, etc. These are cytoplasmic proteins that mediate binding of **N-ethylmaleimide-sensitive fusion protein** to membranes. *See also* **SNARE, SNARE hypothesis**.

SNARE *abbr.* for SNAP receptor; **syntaxin**, **synaptobrevin**, and SNAP-25 (*see* **SNAP** (def. 2)) act as SNAREs; they bind in an ATP-dependent manner to NSF–SNAP complexes (SNAP in this case being the NSF attachment protein (*see* **N-ethylmaleimide**)). Syntaxin, synaptobrevin, and SNAP-25 form a complex that is much more effective than the single proteins acting alone, suggesting that a core complex bridges the synaptic vesicle and plasma membranes, and may function in the docking and fusion process. *See also* **SNARE hypothesis**.

SNARE hypothesis a model of vesicular fusion that involves two types of **SNARE**; v-SNAREs on vesicles and t-SNAREs on target membranes. Each transport vesicle has its own v-SNARE, which recognizes a cognate t-SNARE on a target membrane and mediates docking; fusion is then mediated by **N-ethylmaleimide-sensitive fusion protein** and an attachment protein (**SNAP** (def. 3)).

Snell's law *see* **refraction**.

SNF *abbr.* for sucrose nonfermenting; a defect in *Saccharomyces cerevisiae* that prevents it from metabolizing sucrose because of failure to activate transcription of the sucrase gene. *See* **SWI/SNF**.

Sno symbol for a residue of the ribonucleoside thioinosine; mercaptopurine ribonucleoside; alternative to sI.

snoRNA *abbr.* for small nucleolar RNA.

snoRNP *abbr.* for small nucleolar ribonucleoprotein.

snorp *colloquialism* for snoRNP, i.e. **small nucleolar ribonucleoprotein**.

SNP *abbr.* for single nucleotide polymorphism.

snRNA *abbr.* for small nuclear RNA.

snRNP *abbr.* for small nuclear ribonucleoprotein.

S₁ nuclease EC 3.1.30.1; *recommended name*: *Aspergillus* nuclease S₁; an endonuclease from *Aspergillus oryzae* that degrades single-stranded (ss) RNA or ssDNA to 5' mononucleotides; it has no ap-

parent base specificity. It is useful for the removal of unpaired regions in hybridization technology (see also **S₁ mapping**). The enzyme is a monomer, and contains three zinc atoms.

SNUPE a proprietary name for single nucleotide primer extension; a method for detecting **single nucleotide polymorphisms** in which a primer is annealed to the target sequence with its 3' end immediately before the polymorphic site. The identity of the polymorphic nucleotide is revealed by which of the four different fluorescently labelled dideoxynucleoside triphosphates, incorporated by DNA polymerase, it forms a base pair with.

snurp colloquialism for snRNP, i.e. **small nuclear ribonucleoprotein**.

snurposome any morphologically and biochemically distinct granule in the amphibian oocyte nucleus that contains one or more types of small nuclear ribonucleoproteins (snRNP).

soap any salt formed between a hydroxide of a metal (usually an alkali or alkaline earth) and a higher fatty acid; such compounds are useful as **detergents** (def. 2). It can also mean the salt of any ionized lipid **amphiphath**, e.g. of a long-chain amine or sulfate or of a sterol carboxylate. The common soaps were traditionally the mixed sodium salts (giving **hard soaps**) or the mixed potassium salts (giving **soft soaps**) of oleic, palmitic, and stearic acids, prepared by **saponification** of animal or vegetable fats or oils with sodium or potassium hydroxide respectively. Modern soap compositions are more complex, with solid or liquid soaps containing various additional detergents.

soapstone see **talc**.

SOB medium a nutritionally rich growth medium for the culture of recombinant strains of *E. coli*.

SOC medium a nutritionally rich growth medium for the culture of recombinant strains of *E. coli*. It is identical to **SOB medium** except that it contains 20 mM glucose.

SOD *abbr.* for superoxide dismutase.

soda any of various compounds of sodium, especially sodium hydroxide (NaOH; **caustic soda**), sodium hydrogencarbonate (sodium bicarbonate, NaHCO₃; **baking soda**), sodium carbonate decahydrate (Na₂CO₃·10H₂O; **washing soda**), or sodium monoxide (Na₂O).

soda glass common glass, made from a mixture of silica, sodium oxide (soda), and lime, in approximate proportions SiO₂ 70%, Na₂O 15%, CaO 10%. Its low melting point led to the production of more heat-resisting glasses, e.g. Pyrex. See also **borosilicate (glass)**.

sodium *symbol:* Na; a soft, silvery-white, highly reactive alkali metal of group 1 of the (IUPAC) **periodic table**; atomic number 11; relative atomic mass 22.997. Sodium is widely distributed and is one of the most abundant elements of the Earth's crust, notably as sodium chloride (salt), especially in sea water. Apart from the nonradioactive, and most abundant, isotope, sodium-23, there are two radioactive isotopes, **sodium-22** and **sodium-24**. In biochemistry, sodium (Na⁺) is the principal extracellular cation, and the one that largely determines the extracellular fluid volume. In humans the normal range for plasma sodium is 135–145 mmolL⁻¹. Sodium ions are actively pumped out of cells by **sodium/potassium ATPase**. Their concentration is regulated by **aldosterone**, which increases sodium reabsorption in the kidney distal tubule. Sodium was formerly known as 'natrium', hence the symbol Na and the term **natriuretic**.

sodium-22 a radioactive nuclide of sodium, ²²₁₁Na. It emits a β⁺ particle (1.83 MeV) and gamma radiation (1.275 MeV). Its half-life is 2.605 years.

sodium-24 a radioactive nuclide of sodium ²⁴₁₁Na. It emits an electron (β⁻ particle, 1.39 MeV) and gamma radiation (2.75 MeV). Its half-life is 15.02 h.

sodium-alanine symporter see **sodium/neutral amino acid cotransporter**.

sodium-calcium ion exchanger a plasma membrane protein **antiporter** of muscle and nerve cells that promotes the exchange diffusion of sodium and calcium ions. Influx of Na⁺ to the cytosol drives the efflux of Ca²⁺ from the cell. The affinity for Ca²⁺ is low, so that it only functions at high intracellular Ca²⁺ concentrations, transporting Ca²⁺, e.g., during excitation-contraction coupling.

sodium channel any structure that permits controlled (gated) passage of sodium ions through membranes. Voltage-gated channels are involved in conduction and transmission of nerve impulses,

whereas transmitter-gated channels respond only to neurotransmitters (see **cholinoceptor**). Voltage-gated channels are integral proteins in the plasma membranes of excitable cells. They sense the membrane electric field, opening channels to permit an inward flux of sodium ions, thereby causing the membrane depolarization that is essential for the propagation of the **action potential**. The *Electrophorus* electroplax protein is a single chain of about 2000 amino-acid residues and contains four homologous repeats, each of which has six putative transmembrane segments with extensive nonmembrane cytosolic and extracellular loops. It shares significant homology with other ion channels, particularly the α1 subunit of the Ca²⁺ channel. A cytoplasmic loop has been implicated in the rate of inactivation of the channel. The protein bears about 500 sugar residues (mostly *N*-acetylglucosamine and sialic acid) and 50 fatty-acyl chains (palmitoyl and stearoyl). The mammalian channels are heterooligomeric, consisting of a large α subunit similar to the *Electrophorus* protein, and several other smaller peptides; most of the functional properties reside in the α subunit. The α subunit is the target for polypeptide neurotoxins, e.g. from scorpions; other sodium-channel blockers include **saxitoxin**, **tetrodotoxin**, and **veratridine**.

sodium dodecyl sulfate or (*esp. Brit.*) **sodium dodecyl sulphate** *abbr.:* SDS; sodium lauryl sulfate; CH₃(CH₂)₁₀CH₂OSO₃·Na; the sodium salt of the 1-dodecanol half-ester of sulfuric acid (1-dodecanol was formerly known as lauryl alcohol). It is an anionic detergent and wetting agent; aggregation number 62 (0–0.1 m Na⁺), 101 (>0.1 m Na⁺); CMC 7–10 mm (0–0.05 m Na⁺), 1–2 mm (0.1–0.2 m Na⁺). The amphipathic dodecylsulfate anion is a powerful hydrophobic-bond breaker, hence it is much used in protein chemistry as, e.g., a denaturant, a dissociant of oligomers, and a solubilizer of membrane components. See also **SDS-polyacrylamide gel electrophoresis**.

sodium-hydrogen ion exchanger a plasma membrane protein that functions as a Na⁺/H⁺ **antiporter**. Influx of Na⁺ drives the efflux of H⁺. It functions to maintain intracellular pH, to which it is sensitive, its activity increasing as pH falls.

sodium-ion channel see **sodium channel**.

sodium/neurotransmitter transporter any of a family of integral membrane glycoproteins, having 12 putative transmembrane helices, that are involved in sodium-dependent transport of neurotransmitters: e.g., the sodium- and chloride-dependent GABA transporter 1 from human, which is the target for cocaine and other psychomotor stimulants.

sodium/neutral amino-acid cotransporter an integral membrane protein responsible for the Na⁺-dependent uptake of the neutral amino acids alanine, serine, glycine, cysteine, and proline. Transporters with specificities for different types of amino acid are **system A**, **system L**, and **system N**.

sodium/potassium ATPase EC 3.6.1.37; *recommended name:* Na⁺/K⁺-exchanging ATPase; *systematic name:* ATP phosphohydrolase (Na⁺/K⁺-transporting); *other names:* sodium pump; Na⁺/K⁺-ATPase. An integral membrane protein that catalyses the hydrolysis of ATP to ADP and orthophosphate. Na⁺/K⁺-ATPases pump out approximately 3 Na⁺ ions for every 2 K⁺ ions that enter, with hydrolysis of 1 ATP. They consist of two large α subunits and two smaller β subunits. The α subunits bear the active site and penetrate the membrane, while the β subunits carry oligosaccharide groups and face the cell exterior only. **Ouabain** is a specific inhibitor.

sodium pump any **transporter** of sodium ions across membranes, especially enzymes of the Na⁺/K⁺-ATPase type (see **sodium/potassium ATPase**). The Na⁺/K⁺ ratio across the plasma membrane of eukaryotic cells (outside: Na⁺ 140 mm, K⁺ 10 mm; inside: Na⁺ 10 mm, K⁺ 100 mm) requires that sodium ions be continually pumped out of the cell in exchange for potassium ions if the gradient is to be maintained; this is an energy-requiring process. See also **active transport**.

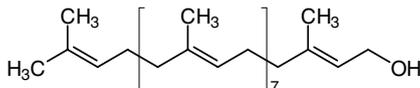

software archive a site, usually accessed by **anonymous FTP**, from which public-domain software can be downloaded. Some software is in binary, i.e. is designed to be loaded directly into the local computer; some code is written in a high-level language, such as C, C++, or PERL, and needs to be compiled locally. Typically software for Windows PCs and Apple Macintosh computers is of the former type, and more generic code and software for UNIX and

Linux systems is of the latter and requires compiling, typically with a supplied **Makefile** or (in the case of Linux) as an **RPM** file.

sol any fluid colloidal system composed of two or more components.

The dispersed phase may be either particles of solid or droplets of liquid, and the continuous phase either a liquid or a gas (see **aerosol**).

solanesol a 45-carbon polyprenol present in tobacco leaves.

solution the (usually reversible) act or process of forming a **sol** from a **gel**. Compare **gelation**. —**solate** *vb*.

solenoid **1** a cylindrical coil of wire that acts as a magnet when carrying an electric current. **2** a tightly coiled higher-order structure of **chromatin** consisting of stacks containing six nucleosomes per turn. **3** the coiled structure of some proteins.

solid a physical state of matter in which the constituent atoms, ions, or molecules have no translatory motion though they vibrate about fixed positions. In **crystalline solids** the constituents are arranged in a definite array, whereas in **amorphous solids** they are not. Solids, especially crystalline solids, commonly have characteristic melting temperatures at which they change to **liquids**.

solid-phase peptide synthesis see **peptide synthesis**.

solid-phase technique any technique in which reagents are immobilized on a support or in some other way insolubilized. In **radioimmunoassay** the insolubility or binding properties of an antigen-antibody complex are commonly exploited to remove labelled antigen. Enzymes immobilized on columns (**immobilized enzymes**) have many applications. In **peptide synthesis**, the growing peptide chain may be immobilized on a column. So-called solid-phase extraction systems are in effect extractions using batch column chromatography techniques, in which the material to be extracted is bound to a column, then removed by **batch elution**. In **peptide sequencing** a peptide immobilized on a column may be degraded residue by residue, facilitating recovery of the undegraded remaining peptide at each cycle.

solid scintillation fluorography a technique for visualizing radioactive materials in a specimen (e.g. a chromatogram) by covering the specimen with a solid **fluor** and allowing the ejected photons to darken an applied photographic emulsion. Compare **fluorography** (def. 2).

solid-state (*in electronics*) describing any system in which current flow takes place entirely through solid materials, such as semiconductors and transistors, rather than through vacuum devices such as thermionic valves.

solubility **1** the attribute of being soluble, of being able to dissolve. **2** the amount of a substance (**solute**) that can dissolve in a given amount of another substance (**solvent**) at a given temperature and pressure.

solubility product *symbol*: K_{sp} ; for a solute $A_x B_y$ that ionizes in a stated solvent according to the equilibrium $A_x B_y \rightleftharpoons xA + yB$, at a given temperature and pressure, $K_{sp} = [a_A]^x [a_B]^y$, where $[a_A]$ and $[a_B]$ are the activities of the two ions when the solution is saturated by the solute. In unsaturated solutions the product $[a_A]^x [a_B]^y$ can have any value less than K_{sp} , but if further amounts of either ion are added from whatever source, such that K_{sp} is exceeded, precipitation from solution will occur to the extent that the relationship $[a_A]^x [a_B]^y = K_{sp}$ is restored. In dilute solutions the concentrations C_A and C_B of A and B may be used as a good approximation.

solubilize or **solubilise** to bring into solution any material, especially complexes that normally exist in the cell as part of membrane structures. Such materials usually have hydrophobic domains, and solubilization depends on masking these with detergents or similar substances, to bring the material into micellar suspension.

soluble **1** capable of being dissolved in or as if in a fluid. **2** (of, e.g., a problem or mathematical equation) capable of being solved.

soluble collagen see **tropocollagen**.

soluble RNA *abbr.*: S-RNA or sRNA; an old term for **transfer RNA** (a 'soluble' RNA fraction from disrupted liver cells that did not sedi-

ment after centrifuging at 100 000 g for several hours led to the discovery of transfer RNA).

solute a dissolved substance, particularly a component of a **solution** that is present in a smaller amount than the **solvent**.

solution **1** a homogeneous molecular mixture of two or more substances, usually of dissimilar molecular structures, i.e. of a solid in a liquid. **2** the action or process of solving a problem. **3** the result of solving a problem, equation, etc.

solvation the (loose) combination of solvent with molecules or ions of the solute.

solvation effect the effect of solvent molecules on the behaviour of (especially) macromolecules in solution, especially during centrifugation.

solution **1** a substance or mixture, usually a liquid, that is able to dissolve other substances to form a solution. Typically it has the same physical state as the solution itself, and is the component of greatest extent in the solution. **2** (*in chromatography*) the liquid used to pass through a chromatography column, paper, or other support to 'develop' the chromatogram.

solvent-perturbation method a technique in which some physical property of a macromolecule is measured in a polar and in a non-polar solvent. For example, it can be determined whether an amino-acid residue in a protein is internal or external by measuring the absorption spectra of the protein in the two types of solvents. Difference spectroscopy is conveniently applied in such instances.

soma (*pl. somata or somas*) **1** the whole of any plant or animal organism but excluding the germ cells. **2** the body, as opposed to the mind. See also **somatic cell**. —**somatic** *adj.*

somat+ a variant form of **somato+** (before a vowel).

somatic cell any cell of an organism other than a germ cell.

somatic cell genetic disorder a genetic disorder in which defects are restricted to specific somatic cells, e.g. cancer cells. This contrasts with germ-line genetic disorders – single gene, multifactorial, and chromosome – in which the abnormality is present in all cells, including the germ cells.

somatic cell hybrid a hybrid cell formed from the fusion of different cells, usually from different species. Somatic cell hybrids obtained by the fusion of human and rodent cells are frequently used for gene mapping. See **cell fusion**.

somatic cell hypermutation The process in the lifetime of a **B lymphocyte** whereby **mutations** arise in the **immunoglobulin** polypeptides. The rate of mutation is especially high in the region around the **IgG** genes. The mechanism becomes activated as B cells differentiate and is associated with **class switching** and so IgG molecules usually vary more from **germline** sequences than **IgM**.

somatic crossing over an alternative name for **mitotic recombination**.

somato+ or (*before a vowel*) **somat+** *comb. for* denoting the body, or soma.

somatocrinin another name for growth hormone releasing hormone (**GHRH**).

somatogenic **1** originating in the **soma** (def. 1), or body tissues. **2** of organic, rather than mental, origin.

somatoliberin the recommended name for growth hormone releasing hormone (**GHRH**).

somatomammotropin human chorionic somatomammotropin; see **choriomammotropin**.

somatomedin *generic name for insulin-like growth factors* (*abbr.*: IGF); in the human they comprise IGF-IA, IGF-IB, and IGF-II. Somatomedins were characterized by: (a) activity on cartilage (incorporation of sulfate and thymidine), (b) insulin-like activity in adipose and muscle, and (c) mitogenic activity in cell culture. Somatomedins A is IGF-II, and somatomedins C is IGF-I (A and B). The term 'somatomedin' should be used only as a generic term, IGF-I (A or B) and IGF-II being used for the specific peptides. Somatomedin B, released from **vitronectin**, is a serum factor of unknown function, is increased in response to **somatotropin**, and is a proteinase inhibitor.

somatostatin or **somatotropin-release inhibiting factor** (*abbr.*: SRIF) or **growth hormone-release inhibiting hormone** (*abbr.*: GHRH); a hypothalamic cyclic 14-residue peptide that inhibits the release of the pituitary growth hormone **somatotropin** and the release

of glucagon and insulin from the pancreas of fasted mammals; it also inhibits the release of gastrointestinal hormones and other secretory proteins. **Somatostatin 14** has the sequence Ala-Gly-Cys-Lys-Asn-Phe-Phe-Trp-Lys-Thr-Phe-Thr-Ser-Cys, with a disulfide link between cysteines 3 and 14. In **somatostatin 28** the 14-residue peptide is extended by the N-terminal residues SANSNPALAPREKAG-. Both forms are derived from the 92 amino-acid precursor, **prosomatostatin**, by tissue-specific proteolytic processing. Somatostatin is widely distributed in the central nervous system and in peripheral tissues such as stomach, intestine, and pancreas. It has effects that are tissue specific, and can function as a neurotransmitter. *See also somatostatin receptor.*

somatostatin receptor any G-protein-associated membrane protein that binds different forms of **somatostatin** and mediates their effects. Some receptors act through G_i to decrease intracellular Ca^{2+} concentrations and inhibit the voltage-dependent current, I_{Ca} . Somatostatin 14 enhances and somatostatin 28 reduces potassium current, I_K . In *Rattus norvegicus* the type 1 receptor has higher affinity for somatostatin 14 than 28 and is coupled to phosphotyrosine phosphatase and sodium-hydrogen-ion exchanger. Types 2 and 3 are receptors for somatostatins 14 and 28 and inhibit adenylate cyclase. Type 4 is a receptor for somatostatin 14 and inhibits adenylate cyclase. Type 5 is a receptor for somatostatin 28 and inhibits adenylate cyclase. Hybridization studies indicate these are members of a larger family of somatostatin receptors; they are G-protein-coupled adenylate cyclase activators.

somatotrope or **somatotroph** a type of cell found in the lateral wings of the anterior pituitary and comprising about 50% of the hormone-producing cells of that part of the gland. Somatotropes are responsible for the production of **somatotropin**, and their adenomas cause **acromegaly**.

somatotroph *see* **somatotrope**.

somatotrophic **1** stimulating and maintaining the growth and development of any cell or tissue. **2** (*sometimes*) of or pertaining to **somatotropin**.

somatotropic **1** of, or relating to, **somatotropin**. **2** stimulating the mechanisms connected with growth or development of a cell or tissue. *Compare somatotropic.*

somatotropic hormone *see* **somatotropin**.

somatotropin or **growth hormone** (*abbr.*: GH); *also called somatotrophic hormone* (*abbr.*: STH); a hormone secreted by the anterior pituitary whose main effect is to stimulate growth. The human hormone (hGH) is mostly synthesized as the precursor of a single-chain, 191-residue protein, M_r 22000, but 5–10% is a form of M_r 20000 resulting from alternative splicing that deletes codons for amino acids 32–46 from the mRNA. Genes encoding hGH, **prolactin**, and **choriomammotropin** form a family with high nucleotide homology with five coding exons. Somatotropin secretion is pulsatile, especially during fasting, when cycles of about four hours' duration occur; it is stimulated by fasting or hypoglycemia, and hormonally by glucagon, GHRH, estrogens, and arginine vasopressin, and during the first phase of sleep; secretion is inhibited by hyperglycemia, somatostatin, the insulin-like growth factor IGF-I, and glucocorticoids. It is secreted from storage granules. *In vivo*, somatotropin tends to promote synthesis of protein, and lipolysis or reduced fat deposition, and growth and mitosis of cartilage. Deficiency leads to pituitary dwarfism types I and IV. Its actions *in vitro* include stimulation of amino-acid uptake in muscle, and lipolysis in adipose tissue, but many of its actions *in vivo* may depend on its action in stimulating synthesis and secretion of **somatomedins**. hGH has 85% homology with human choriomammotropin and 35% homology with human prolactin. *See also* GHRH, GHRH receptor, hypopituitarism.

somatotropin-release inhibiting factor *abbr.*: SRIF; *an alternative name for somatostatin*.

somatrem methionyl human **somatotropin** (growth hormone); somatotropin with an additional N-terminal methionine. It results from the production of somatotropin using cDNA technology in bacterial clones; methionine is involved in the initiation of bacterial protein synthesis.

+some *comb. form* denoting body, esp. intracellular particle.

somite any of a series of paired blocks of mesoderm that form dur-

ing early development in vertebrate embryos and lie on either side of the notochord. —**somital** or **somitic** *adj.*

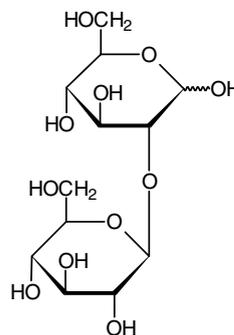

sonicate to expose any material or sample to ultrasonic pressure waves (at or around 20 kHz). The immersion of vessels in a water bath and their exposure to ultrasound is used as a means of cleaning (*see* **sonication bath**). The insertion of a **sonicator** probe into a vessel containing a suspension of membranes or other large assemblies causes their dispersion to smaller aggregates or assemblies.

sonication bath a water bath that is equipped with an oscillator, sited beneath the bowl, to produce ultrasound waves that permeate the water. It may be used for cleaning glass or other vessels or for degassing solvents.

sonicator a device that produces **ultrasonic** pressure waves. It usually consists of a stainless-steel rod, of diameter from 1–2 mm to about 2 cm, that is activated by an oscillator to produce ultrasound waves and is inserted into a vessel to **sonicate** a sample. *See also* **sonication bath**.

sonic hedgehog proteins analogues of **hedgehog protein** found in **zebrafish** and chickens, and involved (in the latter case) in limb-bud pattern formation. The hedgehog proteins thus appear to be vital to pattern formation in several metazoan groups. The name sonic hedgehog is an allusion to a children's animated cartoon character.

sophorose the disaccharide 2-O- β -D-glucopyranosyl-D-glucose; it occurs in a glycoside of *Sophora japonica*.

sorbin a heat-stable peptide isolated from porcine intestine that increases water and sodium absorption in the intestine and gall-bladder.

sorbitol a *nonsystematic name* for D-glucitol, one of the ten stereoisomeric hexitols. It can be derived from glucose chemically or metabolically (by NADPH-requiring aldehyde reductase; *other name*: aldose reductase, EC 1.1.1.21) by reduction of the aldehyde group, and is converted to D-fructose by L-idoitol 2-dehydrogenase (EC 1.1.1.14). It is widely distributed in algae and higher plants, and was first discovered (1872) in the juice of berries from mountain ash (*Sorbus aucuparia*). It about half as sweet as sucrose, and is often used in sweeteners in conjunction with saccharin. Industrially it is of great importance in the food, pharmaceutical, paper, and textile industries. Its formation from excessive glucose concentrations in diabetics may have pathological implications in lens tissue, which cannot convert it to fructose.

sorbose a *trivial name* for the ketohexose xylo-2-hexulose; the enantiomer, L-sorbose, is present in fermented juice of mountain-ash berries, being formed by the bacterial oxidation of **sorbitol**. It is produced by fermentation and used in the manufacture of **ascorbic acid**.

sorcina a protein, encoded in multidrug-resistant cells (*see* **MDR**), that binds calcium with high affinity. *See also* **grancalcin**.

Soret band an absorption band at about 400 nm, characteristic of porphyrins. *See also* **cytochrome absorption bands**. [After Louis Soret (1827–90), Swiss physicist.]

sorocarp *see* *Dictyostelium discoideum*.

sos *symbol for son of sevenless*, a gene for a guanine-nucleotide-releasing protein involved in neuronal development in *Drosophila*. When bound to the activated Sev receptor (*see* **Sevenless protein**) the *sos* product, Sos, activates *ras* by stimulating release of GDP, thereby promoting uptake of GTP.

SOS repair or **error-prone repair** a metabolic alarm system, occur-

ring in bacteria, that helps the cell to save itself in the presence of potentially lethal stresses such as UV irradiation, thymine starvation, or the inactivation of genes essential for replication. Responses include mutagenesis, filamentation (cell elongation in the absence of division), activated excision repair, and activation of latent phage genomes. Mutagenesis occurs because under SOS conditions the gaps formed opposite **thymine dimers** can be filled by replication rather than by daughter-strand transfer. Replication of the dimer template is extremely inaccurate. The proteins involved include RecA protein (see **recA**) and the products of two other RecA-inducible genes; expression is regulated by the **lexA** gene product.

SOURCE *abbr.* for Stanford Online Universal Resource for Clones and Ests; a unified genomic resource for functional annotations, ontologies, and gene expression data.

Southern blotting a procedure for transferring denatured DNA from an agarose gel to a solid support membrane such as nitrocellulose or nylon. It depends on tenacious binding by nitrocellulose of single-stranded (ss) DNA but not of double-stranded (ds) DNA. The gel is soaked in 0.5 M NaOH, which converts the dsDNA to ssDNA. The gel is then overlaid with a sheet of nitrocellulose paper, which in turn is covered by a thick layer of paper towels and the entire assembly is compressed by a heavy weight. The liquid in the gel is forced (blotted) through the nitrocellulose so that the single-stranded DNA binds to it at the same position it had in the gel. The transfer to nitrocellulose can also be accomplished by **electrophoretic transfer**. Nylon is used in preference to nitrocellulose. DNA bands may be located using a radioactive or otherwise labelled probe. The name led to a nomenclature for other types of **blotting** (see also **Northern blotting**, **South-western blotting**, **Western blotting**). [After E. M. Southern (1938–), British molecular biologist.]

South-western blotting a technique in recombinant DNA technology for detecting plaques expressing **fusion proteins** where part of the sequence is for a protein that binds to a particular DNA sequence. After treatment of the plaques to ensure release of the protein, **plaque-lift** is carried out onto a nitrocellulose (or other) **transfer membrane**, which is then incubated with a radiolabelled duplex DNA oligonucleotide that binds to the protein, which can then be detected by **autoradiography**. The term was derived by extension through the cardinal points from **Southern blotting**.

Soviet gramicidin *an alternative name for gramicidin S.*

SOX *abbr.* for SRYHMG-box gene; any of a family of genes encoding transcription factors that are related to SRY and contain HMG-type DNA-binding domains. SOX1 and SOX2 proteins are crucial for activating crystallin genes in the lens but are expressed in many tissues. SOX9 protein (509 amino acids) is widely expressed in fetal and adult tissues and is essential for formation of cartilage and testes. Many mutations result in campomelic dysplasia. **SOX10** is expressed in melanocytes and neural crest derivatives during development, and mutations result in Waardenburg syndrome type 4.

Soxhlet extractor an apparatus for exhaustive extraction of soluble components from a sample of solid material by recycling a solvent through it, whereby solvent vapour from a boiler is continually condensed and the condensate allowed to percolate through the sample in a solvent-permeable thimble, from which it is returned, usually periodically via a siphon, to the boiler, where the eluted substances accumulate. [After Franz Soxhlet (1848–1926), Belgian chemist, who devised it.]

soybean or (*esp. Brit.*) **soya bean** a leguminous plant, *Glycine max*, originating in China (known from at least 2500 BC) but cultivated widely in Asia, Europe, and America for forage and for its seeds. The bean has an oil content of 18–22%, and is also rich in protein — soybean protein is a human food and is the basis of tofu. See also **soybean oil**, **soybean trypsin inhibitor**.

soybean oil an edible oil obtained from the seeds of the soybean plant and valued for its high content of linoleic acid. The composition is typically as follows: 18:2 ω6, 44–62%; 18:3 ω3, 4–11%; 18:1 ω9, 19–30%; 16:0, 7–14%.

soybean trypsin inhibitor *abbr.*: STI; either of two types of trypsin inhibitor, the Bowman–Birk and the Kunitz inhibitors, which have given their names to classes of proteinase inhibitor. The two soybean inhibitors differ from each other in size, structure, and properties. The **Bowman–Birk inhibitor** contains 71 amino acids and

seven disulfide bonds. There are two active sites, one specific for trypsin and the other for chymotrypsin. Bowman–Birk inhibitors are found in many cereals and legumes, and may represent storage proteins. **Kunitz inhibitors** comprise three allelic proteins, A, B, and C, and two Kunitz-type inhibitors, named KT11 and KT12. The A, B, and C proteins have 181 amino acids and two disulfide bonds. They are heat-stable, resistant to proteases, and form a 1:1 stoichiometric complex with trypsin that is highly stable (K_a 5×10^9). They weakly inhibit chymotrypsin and are inactive against other endopeptidases, but modification of Arg⁶³ to Trp converts them to strong chymotrypsin inhibitors with little action on trypsin. The Kunitz family embraces trypsin, chymotrypsin, cathepsin D, and subtilisin inhibitors (see **Kunitz inhibitor**).

sp *abbr.* for synperiplanar; see **conformation**.

sp. (*pl. spp.*) *abbr.* for species (singular).

sp-300 a protein (8204 amino acids) of *Drosophila* that has the same general structure as **ANC-1** of *Caenorhabditis elegans* and the Syne proteins of mammals. It contains multiple spectrin repeats and a nuclear envelope localization domain, and structurally consists mostly of coiled coil.

Sp *abbr.* for isomer of a thionucleotide.

Sp1 *abbr.* for specificity protein 1; a transcriptional activator protein of humans that targets genes by binding to GC-rich sequences in certain promoters. It contains glutamine-rich activation domains that bind components of transcription factor TFIID, including the glutamine-rich component TAFII 130. It interacts with human mutant huntingtin, which carries an expanded glutamine repeat.

SP *abbr.* for 1 secretory piece. 2 substance P. 3 spasmodic polypeptide.

SP-1 *abbr.* for secretory protein 1.

S1P *abbr.* for site-1 protease; a transmembrane serine protease of the subtilisin family. It occurs in the Golgi apparatus, with its catalytic domain in contact with the luminal loop of **SREBP**. S1P is inhibited by binding of sterol to **SCAP**, and cleaves SREBP into its transcriptional and regulatory domains. Release of the transcriptional domain for entry into the nucleus needs a cleavage by **S2P**.

S2P *abbr.* for site-2 protease; a highly hydrophobic zinc metalloprotease of the Golgi apparatus that releases the transcriptional domain of **SREBP** after **S1P** has separated it from the regulatory domain.

[S]pA *symbol* for adenosine 5'-thiophosphate (alternative to AdoP[S]).

space or **volume of distribution** (*in tracer kinetics*) an apparent volume obtained as the amount of radioactivity retained divided by the concentration of the tracer in the plasma. See **apparent exchangeable mass**, **compartment**.

spacer 1 (*in molecular biology*) a sequence of bases of unknown function occurring in DNA and lying between sequences of transcribed DNA; spacer DNA is not usually transcribed. The term also refers to some stretches of **primary transcript**, e.g. a region in the mammalian primary transcript for rRNA, lying between 18S RNA and 28S RNA, that is not found in mature rRNA. 2 (*in chromatography*) *an alternative term for spacer arm.*

spacer arm or **spacer** the (usually) hydrocarbon chain interposed between the specific ligand and the supporting matrix in **affinity chromatography**.

spacer gel (*in electrophoresis*) a small section of gel, polymerized above a polyacrylamide (or other) resolving gel, that lacks resolving power and serves to concentrate the material being electrophoresed as a tight band at the top of the resolving gel.

Spalt a transcription factor protein (1355 amino acids) that contains nine zinc fingers. In mouse it is expressed in the central nervous system, limb buds, palate, teeth, kidneys, and genitals. In *Drosophila* it is involved in wing imaginal disc formation.

SPARC *abbr.* for secreted protein acidic and rich in cysteine; *also called osteonectin*; an abundant non-collagenous protein of bone and cartilage secreted by osteoblasts but widely expressed in cells of tissues undergoing morphogenesis or wound repair and secreted into the basement membrane, where it interacts with other proteins, e.g. collagen and thrombospondin, and appears to have a role in regulating cell growth. It contains an **EF-hand** that binds one calcium ion and an acidic region that binds other calcium ions more loosely.

spare receptor any of the receptors in excess of those required to

evoke a given response to a drug, hormone, or other agonist. The size of the population of spare receptors (**receptor reserve**) can vary with the tissue and with the magnitude of the response being measured. For different drugs, the receptor reserve varies with drug efficacy.

sparging the bubbling of gas into a liquid medium. This technique may be applied to fermenters to introduce air directly into a culture, or it may be used to replace one dissolved gas by another, e.g. in displacing oxygen with an inert gas in liquid chromatography solvents.

sparse matrix (*in sequence analysis*) a **scoring matrix** in which most of the elements or cells have zero score. Sparse matrices perform with high selectivity.

sparsomycin an antibiotic inhibitor of peptidyltransferase activity of prokaryotic ribosomes.

spasmolytic polypeptide *abbr.*: SP. See **trefoil factor**.

spastic ataxia of Charlevoix-Saguenay *abbr.*: SACS; an autosomal recessive early-onset neurodegenerative disease with a high prevalence in the Charlevoix-Saguenay region of Quebec, Canada. It is caused by mutations in the gene (locus at 13q12) for **sacsin**, which contains a single exon encoding 4265 amino acids.

spatula a small, flattened or curved utensil made of metal (often stainless steel), bone, or wood and used to dispense crystalline or powdered material.

Spd *abbr.* for sphingoid.

specialist database or **boutique database** a database that maintains a specialist data set, dedicated, for example, to a specific gene family, molecular or macromolecular property, disease or diseases. For example, GCRDB (G Protein-Coupled Receptor Database) and MEROPS house information relating specifically to the superfamily of G protein-coupled receptors and to peptidases, respectively; BRENDA stores information pertaining to enzymes; DIP houses information on experimentally determined protein-protein interactions; PDBsum (Protein Data Bank summary) summarizes information relating to protein structures in the PDB (Protein Data Bank); OMIM (Online Mendelian Inheritance in Man) contains information on human genes and genetic disorders.

speciation 1 the evolutionary process by which divergent species of animals or plants are formed from a common ancestral stock. **2** the chemical form or compound in which an element occurs in both non-living and living systems. It may also refer to the quantitative distribution of an element.

species (*pl. species*) *abbr.*: sp. (*sing.*) or spp. (*pl.*); a fundamental taxonomic category ranking below a genus and consisting of a group of closely related individuals that can interbreed freely to produce fertile offspring.

species-specific confined to the one or several species referred to.

specific 1 relating to a particular or specified thing. **2** (as a modifier of certain quantitative terms) indicating a relationship of the quantity to mass and dimension in terms of standard (now normally SI) units; e.g. **specific catalytic activity**, **specific enzyme activity**, **specific optical rotation**. **3** of, or relating to, a **species**. See also **specificity**.

specific acid catalysis a **homogeneous catalysis** in which the catalysts are free hydrons, H⁺ (or hydronium ions, H₃O⁺). The catalysis is not affected by other acidic species present. Compare **general acid-catalysis**.

specific activity the **activity** (def. 1, 2) of, e.g., a radionuclide or an enzyme, expressed as a function of mass.

specifically labelled describing an isotopically labelled compound in which both the position of labelling and the number of labelling nuclides at that position are known. Such a molecule is designated by a convention exemplified by CH₂[²H]₂-CH₂-O[²H].

specific base catalysis a **homogeneous catalysis** in which the catalysts are hydroxide ions, OH⁻. The catalysis is not affected by other basic species present. Compare **general base-catalysis**.

specific catalytic activity the **catalytic activity** of an enzyme under specified conditions divided by the mass of an enzyme or enzyme preparation. It is a quantity useful for denoting the extent of purification of an enzyme; it may be expressed in katals per kilogram.

specific dynamic action the increase in heat production that occurs in animals after the ingestion of food, particularly of protein.

specific enzymic activity the phenomenological coefficient that relates **enzymic activity** under specified conditions to the mass of an

enzyme or enzyme preparation. It may be expressed in katals per kilogram of protein. Now obsolete, it has been superseded by **specific catalytic activity**. Compare **molar enzymic activity**.

specific gravity a former name for **relative density**.

specific heat capacity *symbol*: c_p (at constant pressure) or c_v (at constant volume); the quantity of **heat** required to raise the **temperature** of unit mass of a substance by one degree. It is expressed (usually) in J K⁻¹ kg⁻¹.

specificity the degree to which an association between two molecular units may be considered unique; in many applications it is judged by the magnitude of an effect (enzyme-substrate, ligand-receptor interaction, or drug action). It is measured under defined conditions, in relation to the magnitude of effect of other substances with similar action, and when the substance is in direct competition with other such substances. The competitive success of other substances is normally quantified by kinetic analysis. See **competitive inhibition**, **specificity constant**.

specificity constant the ratio of the catalytic constant, k_{cat} , to the Michaelis constant, K_m . It can aid in comparing the activity of an enzyme in its action on different substrates. From **Michaelis kinetics**, using the Michaelis-Menten equation,

$$v = (k_{cat}/K_m)[E]_0[S]$$

when [S] is very small (since then, little enzyme has bound substrate, so $[E] \approx [E]_0$, and [S] can be neglected in relation to K_m). Thus for substrate A,

$$v_a = (k_{cat}/K_m)_A[E]_0[A],$$

and for substrate B,

$$v_b = (k_{cat}/K_m)_B[E]_0[B].$$

So

$$v_a/v_b = (k_{cat}/K_m)_A \times [A] / (k_{cat}/K_m)_B \times [B],$$

and, at the same substrate concentrations, the activity of the enzyme against the different substrates reduces to a comparison of the respective specificity constants (k_{cat}/K_m); K_m is not of itself a sufficient index of specificity.

specific optical rotation *symbol* $[\alpha]_D^{25}$; the optical rotation of light of a specified wavelength (or frequency) achieved by a solution at a specified temperature. It is given by the relation $[\alpha]_D^{25} = \alpha/l\rho$ where α is the observed rotation in degrees, l is the length of the sample tube (in dm), ρ is the density of the liquid (in gm l⁻¹), λ is the wavelength of the light (or other electromagnetic radiation) used, and θ is the Celsius temperature. For a solution of concentration c (in g solute per 100 ml solution), $[\alpha]_D^{25} = \alpha/lc$ in degrees dm² g⁻¹. Compare **molecular optical rotation**.

specific refractivity see **refractivity**.

specific viscosity *symbol*: η_{sp} ; the fractional change in **viscosity** produced by adding a solute to a solvent. It is given by the equation:

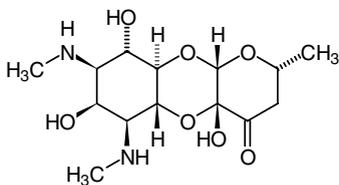

$$\eta_{sp} = (\eta / \eta_0) - 1 = Avc + Bv^2c^2 + Cv^3c^3 + \dots$$

where η_0 is the viscosity of the solvent, η is the intrinsic viscosity of the solution, A , B , and C are shape-dependent constants, c is the concentration of the solute, and v is the specific volume of one solute molecule.

specific volume *symbol*: v ; for a pure substance, the volume, V , of a sample, divided by the mass, m , of the sample; $v = V/m = 1/\rho$, where ρ is the **mass density** of the substance. The SI unit is m³ kg⁻¹. See also **partial specific volume**.

'specifier' protein a protein that, when it combines with an enzyme or enzyme-substrate, modifies the catalytic specificity of the system. An example is α -lactalbumin, which modifies the substrate (acceptor) specificity of *N*-acetylglucosamine synthase (EC 2.4.1.90; *other name*: UDPgalactose:*N*-acetylglucosamine β -D-galactosyltransferase) from *N*-acetylglucosamine to glucose.

spectinomycin an aminocyclitol antibiotic secreted by *Streptomyces spectabilis*. It is widely active against Gram-negative bacteria, including *Neisseria gonorrhoeae*, but less so against Gram-positive bacteria. It inhibits protein synthesis by binding to the 30S ribosomal subunit.

spectra the plural of **spectrum**.

spectrin a protein that is the major constituent of the erythrocyte cytoskeletal network. It associates with band 4.1 (*see band protein*) and **actin** to form the cytoskeletal superstructure of the erythrocyte plasma membrane. It is composed of non-homologous chains, α and β , which aggregate side-by-side in an antiparallel fashion to form dimers, tetramers, and higher polymers. Anchorage to the cytoplasmic face of the plasma membrane is mediated by another protein, **ankyrin**, which links β spectrin to transmembrane protein band 3, and by the binding of band 4.1 to **glycophorin**. Interaction between spectrin and other proteins is thought to be responsible for maintenance of the biconcave shape of human erythrocytes, for regulation of plasma membrane components, and for maintenance of the lipid asymmetry of the plasma membrane.

spectrin repeat *see spectrin*.

spectrofluorometer an instrument used for measuring the **fluorescence** emitted by compounds excited by incident radiation produced within the instrument. The excitation radiation is produced by a lamp, and filters or diffraction grating monochromators are employed to isolate both the incident and emitted radiation to narrow wavebands. The emitted radiation is detected by photomultipliers.

spectrogram a photographic record of a **spectrum** produced by a **spectrograph**.

spectrograph a **spectrometer** or **spectroscope** with a facility for producing a photographic record of the spectrum under consideration. *Compare spectroscopy*. —**spectrographic** *adj.*; **spectrographically** *adv.*; **spectrography** *n.*

spectrometer any instrument used to produce and examine a **spectrum**, such as a **spectrophotometer** or a **spectroscope**. —**spectrometric** *adj.*; **spectrometry** *n.*

spectrophotometer an apparatus to measure the proportion of the incident light (or other electromagnetic radiation) absorbed (or transmitted) by a substance or solution at each wavelength of the spectrum. —**spectrophotometric** *adj.*; **spectrophotometry** *n.*

spectroscope an instrument for studying spectra, either qualitatively or quantitatively. —**spectroscopic** or **spectroscopical** *adj.*; **spectroscopically** *adv.*

spectroscopy the investigation of the chemical composition, molecular structure, or atomic structure of a substance or solution by observation of its interaction with electromagnetic radiation using a spectroscope.

spectrum (*pl. spectra*) (*in physics*) an arrangement of the components of a complex electromagnetic radiation (light, etc.) or sound in order of frequency or energy, thereby showing a distribution of energy among the components. —**spectral** *adj.*

Spemann's organizer an embryonic signalling centre located in the dorsal lip of the blastopore. It plays a crucial role in the organization of the formation of the main body axis of a developing embryo. [After Hans Spemann (1869–1941), German zoologist and embryologist.]

spermaceti or **cetaceum** a white, translucent, waxy solid, m.p. 42–50°C, consisting mainly of the ester cetyl palmitate and obtained from oil in the head of the sperm whale (*Physeter catodon*) and related cetaceans. It is used in the manufacture of cosmetics, ointments, soaps, etc.

spermadhesin or **AQN1** a secretory protein of male accessory glands that is found on the sperm surface, and mediates sperm binding to the zona pellucida.

spermatogenesis the formation of spermatozoa in the male reproductive system. The sperms are formed from male germ cells, **sper-**

matogonia, which line the inner wall of the seminiferous tubules in the testis. A single spermatogonium divides by mitosis to form **primary spermatocytes**, each of which undergoes the initial division of meiosis to form two **secondary spermatocytes**. Each of these then undergoes the second meiotic division to form two **spermatids**, which mature into spermatozoa without further cell division by a process called **spermiogenesis**. All these cell types are nourished and supported by neighbouring **Sertoli cells**. Spermatogenesis also requires the presence of testosterone-secreting **Leydig cells**.

spermatogenesis factor *see dysferlin*.

spermidine *N*-(3-aminopropyl)-1,4-diaminobutane; $\text{NH}_2(\text{CH}_2)_3\text{NH}(\text{CH}_2)_4\text{NH}_2$; one of the polyamines.

spermidine synthase EC 2.5.1.16; *other names*: putrescine aminopropyltransferase; aminopropyl-transferase; an enzyme that catalyses the formation of **spermidine** and 5'-methylthioadenosine from *S*-adenosylmethioninamine and putrescine.

spermine *N,N*-bis(3-aminopropyl)-1,4-diaminobutane; $\text{NH}_2(\text{CH}_2)_3\text{NH}(\text{CH}_2)_4\text{NH}(\text{CH}_2)_3\text{NH}_2$; one of the polyamines.

spermine synthase EC 2.5.1.22; *other name*: spermidine aminopropyltransferase; an enzyme that catalyses the formation of **spermine** and 5'-methylthioadenosine from *S*-adenosylmethioninamine and spermidine.

sperm tail *see cilium*.

SPF *abbr. for* specific-pathogen-free.

Sph *symbol for* sphingosine.

S phase the phase of the eukaryotic cell cycle in which DNA is synthesized. *See cell-division cycle*.

spherocyte a red blood cell that has lost its normal biconcave shape owing to damage to the surface membrane or to some disorder of metabolism. Spherocytes appear smaller and darker than normal red cells.

spherocytosis the condition of having **spherocytes** in the blood. Hereditary spherocytosis in humans is a chronic hemolytic anemia that results from defects in ankyrin, band 3 protein, α spectrin, β spectrin, or 4.2 protein.

spheroid 1 a solid figure that is similar to but not identical with a sphere. **2** an **ellipsoid of rotation**, especially one in which the major axis of its parent ellipse is only slightly longer than its minor axis. —**spheroidal** *adj.*

spheroplast the globular form of a bacterial cell in which the cell-wall structure has been modified (e.g. by growth in the presence of penicillin) rather than totally removed. The term also denotes a form of yeast cell obtained by partial hydrolysis of the cell wall. A prefix may be used to indicate the method of induction, e.g. penicillin-spheroplast. *Compare protoplast*.

spherosome an organelle, generally spherical or oblate and 0.4–3 μm in diameter, that occurs in lipid-storage tissues in plants, e.g. endosperm of castor-bean seeds. Spherosomes are enclosed within a phospholipid monolayer (a half-unit membrane) with embedded oleosins and other proteins, and contain triacylglycerols formed by enzymes in the endoplasmic reticulum (ER) and partitioned into the interior of the ER membrane at sites defined by the presence of oleosins.

sphinganine *D-erythro-2-amino-1,3-octadecanediol*; *D-erythro*-dihydrospingosine; the metabolic precursor of **sphingosine**. It is formed from palmitoyl-CoA and serine by the action of **serine C-palmitoyltransferase**, which forms 3-dehydro-*D*-sphinganine, which is then reduced to sphinganine by 3-dehydrospingosine reductase, EC 1.1.1.102. *See also sphingolipids, sphingoid*.

sphingoid or **sphingoid base** *symbol*: Spd; any of a class of compounds comprising **sphinganine**, and its homologues and stereoisomers, and derivatives of these compounds.

sphingolipid any lipid that contains the long-chain amino diol, **sphingosine**, or a closely related base (i.e. a **sphingoid**). A fatty acid is bound in an amide linkage to the amino group and the terminal hydroxyl may be linked to a phosphate ester or a carbohydrate. The predominant base in animals is sphingosine while in plants it is **phyto-sphingosine**. The main classes are: (1) phosphosphingolipids (also known as sphingophospholipids), of which the main representative is **sphingomyelin**; and (2) **glycosphingolipids**, which contain at least one monosaccharide and a sphingoid, and include the **cerebrosides**

and **gangliosides**. Sphingolipids have a structural role in cell membranes, and may be involved in the regulation of protein kinase C.

sphingolipid activator proteins *see* **saposins**.

sphingolipidosis (*pl.* **sphingolipidoses**) any inherited pathological condition in humans in which one or more sphingolipids accumulate in the tissues because of a deficiency of the corresponding degradative enzyme. They include **ceramidase** deficiency, **Fabry's disease**, **galactosylceramide lipidosis**, G_{M1} and G_{M2} **gangliosidoses**, **Gaucher's disease**, **metachromatic leukodystrophy**, and **sphingomyelin lipidosis**.

sphingomyelin *N*-acyl-4-sphingeny-1-*O*-phosphorylcholine; any of a class of phospholipids in which the amino group of **sphingosine** is in amide linkage with one of several fatty acids, mostly C_{20} or higher and either saturated or monounsaturated, while the terminal hydroxyl group of sphingosine is esterified to phosphorylcholine. Sphingomyelins are found in large amounts in brain and other nervous tissue. They do not occur in plants.

sphingomyelinase *see* **sphingomyelin phosphodiesterase**.

sphingomyelin lipidosis or **Niemann-Pick disease** a genetic disease of humans in which **sphingomyelin** accumulates in the tissues due to a deficiency of the enzyme **sphingomyelin phosphodiesterase**. It is associated with mental retardation.

sphingomyelin phosphodiesterase EC 3.1.4.12; *other names*: acid sphingomyelinase; neutral sphingomyelinase; a lysosomal enzyme that catalyses the hydrolysis of sphingomyelin to *N*-acylsphingosine and choline phosphate. Deficiency of the enzyme is the cause of Niemann-Pick disease (**sphingomyelin lipidosis**), in which there is an accumulation of sphingomyelin.

sphingophospholipid *see* **sphingolipid**.

sphingosine *symbol*: Sph; *trans*-*D*-erythro-2-amino-4-octadecene-1,3-diol; $CH_3(CH_2)_{12}CH=CH-CHOH-CHNH_2-CH_2OH$; a long-chain amino diol sphingoid base that occurs in most **sphingolipids** of animal tissues. *See also* **phytosphingosine**.

sphingosine *N*-acyltransferase EC 2.3.1.24; an enzyme of the pathway for synthesis of sphingolipids that catalyses the acylation of sphingosine by acyl-CoA to form *N*-acylsphingosine (ceramide) and CoA.

spicule a roughly cone-shaped structure or tissue element, such as that projecting from the membrane of a red blood cell. Calcareous or siliceous spicules are found in the skeletons of sponges and corals.

spin (*in physics*) **1** the quantized angular momentum of an elementary particle, in the absence of orbital motion. **2** the quantized angular momentum of an atomic nucleus, including contributions from the orbital motions of nucleons. **3** the quantized angular momentum of an electron that adds to the orbital angular momentum, thus producing fine structure in line spectra.

spinal and bulbar muscular atrophy (*abbr.*: SBMA) or **Kennedy's disease** an X-linked progressive neuromuscular disorder that results in proximal muscle weakness, muscle atrophy, and involuntary contractions or fasciculations. It is caused by expansion of a CAG trinucleotide repeat in the androgen receptor gene. [After William Kennedy, US neurologist.]

spinal cord the part of the central nervous system that is enclosed in the vertebral column. It connects the innervation of most parts of the body via the spinal nerves to the brain.

spinal muscular atrophy an autosomal recessive disorder in which degeneration of lower motor neurons leads to progressive atrophy of limb and trunk musculature. It is caused by mutations in a neuronal apoptosis inhibitory protein. *See* **IAP**.

spinal nerves the pairs of nerves that arise from the spinal cord and are distributed to various peripheral parts of the body. In humans there are 31 pairs.

spin column chromatography or **spun column chromatography** a small-scale chromatography procedure in which fluid is moved through the column by centrifugal force. It has the advantage that several columns can be run simultaneously in the centrifuge rotor.

spin coupling or **spin-spin coupling** (*in magnetic resonance spectroscopy*) the influence of a nuclear or electron spin on another. In NMR the nuclear spin of one nucleus is coupled via the bonding electrons to the coupled nucleus, which experiences two different microenvironments and thus resonates at two slightly different frequencies. This results in the splitting (**spin-spin splitting**) of the

resonance line into two lines (a doublet). In EPR spectroscopy the electron-nuclear coupling is known as **hyperfine coupling**. Electron-electron couplings can also occur, and lead to splitting or broadening of the EPR spectrum.

spin density the fraction of unpaired electron spin that is in the vicinity of a given atomic nucleus in a molecule.

spindle the array of microtubules and associated molecules that forms between the opposite poles of a eukaryotic cell during mitosis or meiosis and serves to move the duplicated chromosomes apart. During mitosis the spindle starts to form outside the nucleus while the chromosomes are condensing during prophase. At the start of M phase, the two **centrosomes** that have been formed move to opposite sides of the nucleus, and form the two poles of the mitotic spindle. Microtubules grow away from the centrosomes towards the chromosomes, the minus ends being attached to the centrosome, and the plus ends growing towards the **kinetochore**. These microtubules eventually bind to kinetochores and are thus known as kinetochore microtubules. Other microtubules, known as polar microtubules, grow towards the chromosomal region, but eventually bind directly to other polar microtubules growing from the opposite centrosome. These push the poles of the spindle apart. Each centrosome eventually becomes attached through the kinetochore microtubules to one of the sister chromatids of each chromosome, and pulls these away to effect the chromatid separation that occurs at anaphase. A similar series of events occurs at the corresponding phases of meiosis.

spin hamiltonian a formulation in **quantum mechanics** used in the determination of the energy levels of the spin of an electron or a nucleus in **electron spin resonance spectroscopy** or, less commonly, in **nuclear magnetic resonance spectroscopy**. *See also* **Hamiltonian operator**.

spin immunoassay or **free-radical assay technique (of immunoassay)** (*abbr.*: FRAT) a technique in which a **spin label** is attached to a specimen of the substance to be assayed and an antibody is raised against the substance. On mixing the antibody with the labelled substance there is a change in the electron spin resonance (ESR) spectrum because of the inhibition of tumbling caused by the antibody 'immobilizing' the labelled substance. On adding some of the unlabelled substance there is competition for the antibody, and the changes in the ESR spectrum are partially reversed to an extent dependent on the concentration of the added, unlabelled, substance.

spin label 1 a synthetic paramagnetic organic free radical, usually having a molecular structure and/or chemical reactivity that facilitates its attachment or incorporation at some particular target site in a macromolecule, or assemblage of macromolecules. **2 spin-label** to effect labelling of a substance or structure with a spin label (*def.* 1).

spin-lattice relaxation time or **longitudinal relaxation time** (*in magnetic resonance spectroscopy*) *symbol*: T_1 ; the time taken for the upper nuclear or electron spin state to dissipate its excess energy. Its reciprocal is the spin-lattice relaxation rate (*see* **correlation time**).

spinner culture a method of culturing cells that uses the rotation of an impeller to maintain cells in suspension.

spinocerebellar ataxia *abbr.*: SCA; any of a heterogeneous group (SCA1 to SCA10) of neurological disorders caused by variable degrees of degeneration of the cerebellum, brainstem neurons, and spinocerebellar tracts. Most subtypes result from expansion of the number of translated or untranslated CAG trinucleotide repeats in a gene for an ataxin, atrophin-1, or the $\alpha 1A$ subunit of a neuronal Ca^{2+} channel. *See* **hemiplegic migraine**.

spin polarization or **spin polarisation** a phenomenon in which the unpaired electron spin on one atom or part of a molecule is transferred to another atom, brought about by interaction between the unpaired electron on the first atom and the paired electrons on the second atom (which lacks unpaired electrons) causing one of the paired electrons to have a lower energy than the other. *See also* **chemically induced dynamic nuclear polarization**.

spin probe *see* **electron paramagnetic resonance spectroscopy**.

spin-spin broadening an increase in line width in **electron spin resonance spectroscopy**, caused by interactions between neighbouring dipoles.

spin-spin coupling *see* **spin coupling**.

spin-spin coupling constant (*in nuclear magnetic resonance spec-*

scopy) a measure of the specific interaction of one nucleus with another that gives rise to a splitting of the resonance bands produced by each nucleus.

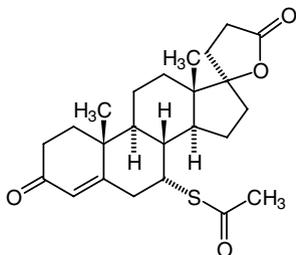

spin-spin splitting splitting in the lines of a magnetic resonance spectrum brought about by the interaction of the magnetic moment of the nucleus or unpaired electron in a molecule with those of neighbouring nuclei or electrons. It is used in the assignment of particular nuclear resonances and in the determination of molecular conformations. *See also* **hyperfine splitting**.

spin state the orientation, in a strong magnetic field, of an unpaired electron or nuclear spin, e.g. parallel or antiparallel to the field direction.

spin trapping a technique in which a reactive free radical is trapped by an addition reaction to produce a more stable radical, detectable by **electron spin resonance spectroscopy**, whose hyperfine coupling parameters permit identification of the initial radical trapped.

spiro compound any compound containing two rings joined by one common atom, designated the **spiro atom**, as in the case of the γ -lactone ring of **spironolactone**.

spironolactone 7-(acetylthio)-17-hydroxy-3-oxo-pregn-4-ene-21-carboxylic acid γ -lactone; a synthetic steroid lactone that is used as a diuretic. It is structurally similar to **aldosterone**, and competitively inhibits the renal tubular action of this hormone. It is metabolized to canrenone, the active compound, by removal of the acetylthio group and insertion of a 6,7 double bond.

spleen exonuclease *see* **phosphodiesterase II**.

spleen tyrosine kinase *see* **Syk**.

splenin *see* **thymopoietin**.

splenopentin a synthetic peptide that corresponds to residues 32–36 of splenin (*see* **thymopoietin**).

spliceosome a **ribonucleoprotein** complex, containing RNA and **small nuclear ribonucleoproteins** (snRNPs) that is assembled during the **splicing** of the messenger RNA **primary transcript** to excise an **intron**. snRNPs designated U1, U2, U4, U5, and U6 are variously involved; U1 may bind the GU consensus sequence of the 5' **splice site** and U5 with U4/U6 probably binds to the 3' splice site consensus sequence, AG. U2 may be part of a component binding the UACUA[A]C consensus sequence ([A] is invariant) at a site slightly upstream from the 3' splice site, known as the branch site. The mechanism appears to involve cutting at the 5' side of the GU consensus sequence, which curls back to form a G5'–2'A bond with the invariant A of UACUA[A]C. This linkage generates the loop of the so-called **lariat**. Cutting out the 3' splice site follows on the 3' side of AG to release the complete intron (in the form of the lariat), and the cut ends of the exons are then ligated.

splice site the sequence of bases at each end of an **intron** that determines the point of **splicing**. The 5' splice site (site at the 5' end of the intron) is termed the donor site, consensus sequence GU, while the 3' splice site is termed the acceptor, consensus sequence AG.

splice variant or **alternatively spliced form** any of various proteins of different length that arise through translation of mRNAs that have not included all available exons in the template DNA.

splicing I (*of DNA*) the covalent linkage, by the action of a **DNA ligase** (EC 6.5.1.1, requires ATP, or EC 6.5.1.2, requires NAD⁺), of two fragments of duplex DNA at complementary single-stranded terminations. **2** (*of RNA*) the enzymic process in eukaryotic cells by which **introns** are excised from heterogeneous nuclear RNA (hnRNA) following its transcription from DNA, and the cut ends are rejoined

to form messenger RNA (mRNA), in which the message is continuous, before its translation into polypeptide. In yeast, the splicing of transfer RNA involves cutting at the splicing junctions by an endonuclease, followed by a process involving ATP, whereby the two exon sequences are joined. Group I mitochondrial RNA is spliced by an autocatalytic mechanism, the RNA itself having the ability to catalyse its own splicing; nuclear mRNA precursor – the primary transcript – is spliced by a complex assembly incorporating snRNP and called a **spliceosome**; it involves the formation of a **lariat**. Splicing of group II mitochondrial RNA also involves the formation of a lariat, but without formation of a spliceosome. Splicing in which the cut ends are joined directly within the same RNA molecule is called **cis-splicing**; **trans-splicing** refers to situations in which the cut end from the splicing site rejoins to a splicing site on another RNA molecule. **3** (*of protein*) a post-translational modification of protein that includes two concerted proteolytic cleavages and one ligation, resulting in excision of an inner sequence of the original polypeptide chain to form one protein, and ligation of the two outer sequences to form a second protein. It is thought to be an autocatalytic process. The excised inner sequence is known as an **intein**, the ligated outer sequences as an **extein**. *See also* **gene splicing**.

splicing factor 2 *abbr.*: SF2; a protein, present in nuclear extracts, that functions in an early step in splicing pre-mRNA. It is resistant to mild heat treatment, but inactivated by *N*-ethylmaleimide. It consists of two peptides, P32 and P33, and is involved in ensuring accuracy of splicing. *See also* **pre-mRNA processing protein**.

splicing regulatory protein *see* **SR protein**.

split gene a gene that consists of coding (exon) and noncoding (intron) sequences.

spoke protein a protein associated with the filamentous structure of kinetochore microtubules in the mitotic spindle. Soluble, and cytoplasmically localized during interphase, it becomes primarily associated with the mitotic spindle in mitosis.

spongiform encephalopathy any disease of humans and other animals characterized by the presence of many vacuoles in brain tissue, giving it a spongy appearance. The group includes **bovine spongiform encephalopathy**, **scrapie** in sheep, and **Creutzfeldt–Jakob disease**, **Gerstmann–Straussler syndrome**, and **kuru** in humans. Some of these are classified as **transmissible spongiform encephalopathies**, being caused by infectious agents and carried from one individual to another and in some cases from one species to another. *See also* **prion**, **prion protein**.

spontaneous generation *see* **abiogenesis**.

spontaneous hypoglycemia *see* **glycemia**.

spore a small, often microscopic, reproductive unit consisting of one or several cells. Spores are produced by fungi, bacteria, certain plants, and protozoa. They may variously serve as a means of rapid vegetative propagation, or as a dormant stage in the organism's life cycle. Spores have very low metabolic activity and give rise to a vegetative cell upon germination; they are usually more heat resistant than vegetative cells and are adapted for dispersal. Spores may be sexual or asexual.

sporulation the formation of **spores**.

spot 1 (*in chemistry*) or **spot test** to test for a substance by applying a small amount of detection reagent to a surface. **2** (*in molecular biology*) to detect, using radioactive oligonucleotide probes, oligonucleotides applied in spots onto hybridization filters (**spot blots**).

spot a gene in *Escherichia coli* for the enzyme guanosine-3',5'-bis(diphosphate) 3'-pyrophosphohydrolase; EC 3.1.7.2; *other name*: (ppGpp)ase; it catalyses the hydrolysis of guanosine 3',5'-bis(diphosphate) to guanosine 5'-diphosphate and pyrophosphate as a part of the **stringent response**. The name is jocular, ppGpp and pppGpp being called 'magic spot nucleotides'. *See also* **relA**, **stringent factor**.

spp. *abbr.* for species (plural).

SPP-1 *see* **osteopontin**.

SPP *abbr.* for signal peptide protease.

[S]ppA *symbol* for adenosine 5'- β -thiodiphosphate (alternative to AdoPP[S]).

SP6 phage promoter a 20 bp sequence from bacteriophage SP6 that is sometimes incorporated into the design of plasmid vectors to permit **in vitro transcription** of cloned inserts using SP6 RNA polymerase.

[S]pppA symbol for adenosine 5'- γ -thiotriphosphate (alternative to AdoPPP[S]).

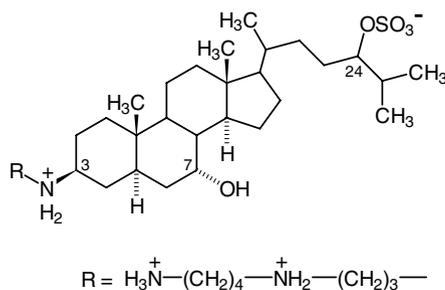

spreading factor see **hyaluronidase**.

SP6 RNA polymerase a single subunit enzyme from bacteriophage SP6 that transcribes genes downstream from the **SP6 phage promoter**.

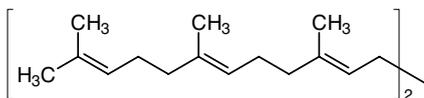

SQDG *abbr.* for sulfoquinovosyldiacylglycerol (see **sulfonolipid**).

SQL *abbr.* for symbolic query language; a **query language** used with relational databases, e.g. **SYBASE**. It is often pronounced 'sequel'.

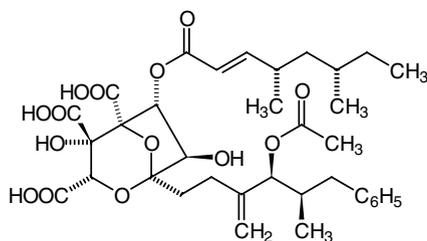

squalamine an aminosterol from the dogfish shark, *Squalus acanthias*. It has antibiotic properties against Gram-negative and Gram-positive bacteria and protozoa. It is an adduct of **spermidine** and a sulfate bile salt.

squalene 2,6,10,15,19,23-hexamethyl-2,6,10,14,18,22-tetracosahexaene; the linear triterpene precursor of all cyclic triterpenoids and the sterols. Although first isolated from shark-liver oils, it is widely distributed in plant and animal cells as a metabolic intermediate. It is formed from acetyl-CoA, via **mevalonate**, **isopentenyl diphosphate**, **geranyl diphosphate**, and **farnesyl diphosphate**. The latter is converted to presqualene diphosphate, which is then reduced to squalene by NADPH with loss of pyrophosphate; both steps are catalysed by **farnesyltransferase**. [From Latin *squalus*, marine fish, later specifically used to mean shark.]

squalestatin a fermentation product of *Coelomycete* spp. and a selective inhibitor of squalene synthase. It lowers serum cholesterol.

sr symbol for steradian.

Sr symbol for strontium.

SR *abbr.* for sarcoplasmic reticulum.

src an oncogene (*v-src*), originally discovered in the Rous sarcoma virus, whose product is pp60^{v-src}, a 60 kDa protein that undergoes phosphorylation/dephosphorylation. The **protooncogene**, *c-src*, codes for a related protein; both proteins are **tyrosine kinases**. The C-terminal 19 residues of pp60^{v-src} are replaced by 12 other residues in pp60^{c-src}. The Src family is the largest of the nonreceptor tyrosine kinase families. It includes Src, Yes, Fyn (see **FYN**), Lck (see **LCK**),

Lyn (see **lyn**), Blk (see **blk**), Hck, Fgr (see **FGR**), and Yrk, which range in size from 53 to 64 kDa. They all have an N-terminal myristoylation site, a unique domain, an SH2 domain and an SH3 domain (see **SH domain**), a tyrosine kinase domain, and a C-terminal regulatory domain. In vertebrates, the kinase activity is usually inhibited by the phosphorylation of a tyrosine residue within the kinase domain. In *v-src* the region encoding this tyrosine is deleted leading to v-Src having a higher constitutive tyrosine kinase activity than c-Src. Other mutations associated with oncogenic activation map to the SH2 and SH3 domains, suggesting that Src may be inactivated by the binding of its SH2 domain to the phosphotyrosine residue in its negative regulatory domain. The SH3 domain may also participate in this repression.

Src homology domain see **SH domain**.

Srd symbol for a residue of the ribonucleoside thiouridine (when the position of the thiol group in its thiouracil moiety is unknown or unspecified; alternative to S or sU).

SRE *abbr.* for serum response element.

SREBP *abbr.* for sterol-response-element binding protein; any of three transcription factors that are membrane proteins of the endoplasmic reticulum and Golgi apparatus. Each is complexed with **SCAP** (SREBP-cleavage activating protein), which serves as a sterol sensor. SREBP is cleaved by two Golgi-specific proteases, **S1P** and **S2P**, which release the transcription domain for entry into the nucleus and transcription of genes that contain a 10 bp sterol-response element in their promoter region. These include genes for LDL receptor and enzymes of cholesterol, fatty acid, and triacylglycerol synthesis. SREBP is a polypeptide of \approx 1100 amino acids. Its N-terminal half contains a sequence of acidic residues (for binding of accessory transcriptional activators), a basic helix-loop-helix-leucine zipper sequence (for DNA binding and for homodimer or heterodimer formation), and a transmembrane segment. The C-terminal half contains one transmembrane segment and a regulatory domain that interacts with the cytoplasmic domain of SCAP. Cholesterol and polyunsaturated fatty acids, acting via the sterol-sensing domain of SCAP, block the release of the transcriptional domain of SREBP by S1P and S2P. In animals SREBP-1a and -1b are encoded by the same gene using alternative splicing; SREBP-2 is encoded by a different gene.

SREBP-cleavage activating protein see **SCAP**.

SRF *abbr.* for serum response factor; a nuclear, dimeric transcription factor. It binds **Elk-1**, which is constitutively bound to the **serum response element**.

SRIF *abbr.* for somatotropin release-inhibiting factor (i.e. **somatostatin**).

sRNA or **S-RNA** *abbr.* for soluble RNA (an early name for **transfer RNA**).

SRP *abbr.* for signal recognition particle.

SR protein *abbr.* for splicing regulatory protein; any protein that contains one or more N-terminal RNA-recognition domains that bind RNA with sequence specificity, and a C-terminal Arg-Ser-rich (or RS) domain for protein binding. They function in pre-mRNA splicing and assemble on exonic splicing enhancer sequences. When they bind the C-terminal domain (CTD) of the largest subunit of RNA polymerase II they are called **SCAF** or **CASP**.

SR-related protein any protein that is related to, but different structurally and functionally from, proteins of the SR family. They function as splicing factors but are not part of small nuclear ribonucleoproteins. They bind to exonic splicing-enhancer sequences on pre-mRNA. Compare **SR protein**.

SRS or **SRS-A 1** *abbr.* for slow reacting substance (of anaphylaxis). **2** *abbr.* for Sequence Retrieval System; see **information retrieval software**.

S \rightarrow **R** variation see **smooth-rough variation**.

SRY *abbr.* for sex-determining region of Y chromosome; *other name*: testis-determining gene; a gene on the Y chromosome in humans that encodes a DNA-binding protein (240 amino acids) that induces differentiation of Sertoli cells in the developing gonad so that they produce and secrete anti-Müllerian hormone, which causes regression of female internal genitalia. It also induces Leydig cells to secrete the androgen necessary for development of male genitalia. The DNA-binding domain (\approx 80 amino acids) is homologous with

that of HMG proteins. Many mutations in the gene cause familial XY gonadal dysgenesis (i.e. a female phenotype in the presence of X and Y chromosomes).

ss *abbr.* for single-stranded.

SSB protein *abbr.* for single-strand binding protein.

SSC a solution used in DNA hybridization procedures. A solution of 20× SSC contains 3.0 M NaCl and 0.3 M sodium citrate.

SSCP analysis *abbr.* for single-strand conformation polymorphism analysis.

ssDNA *see* DNA.

SSPE a solution used in DNA hybridization procedures. A solution of 20× SSPE contains 3.0 M NaCl, 0.2 M NaH₂PO₄, and 0.02 M EDTA.

SSR *abbr.* for simple sequence repeat.

St *symbol* for stokes (a cgs unit of kinematic viscosity).

Sta *symbol* for statine.

stability constant *symbol:* K_s ; an equilibrium constant for the reversible formation of a complex chemical compound from two or more simpler entities; the reciprocal of the **dissociation constant**. In some cases, an **apparent stability constant** (*symbol:* K'_s), constrained with respect to certain variables (e.g. pH) is determined (for the distinction see **equilibrium constant**). The stability constant is also known as the **association constant** (*symbol:* K_{ass}) in cases where ions associate into a substance, e.g. for the reaction $A^+ + B^- \rightleftharpoons AB$, the (concentration) stability or association constant is given by:

$$K_s = [AB]/[A^+][B^-] = K_{\text{ass}}$$

stable expression (*in genetics*) the production of a recombinant protein sustained over a period of weeks or months. *Compare* **transient expression**.

stable factor *an alternative name for* factor VII; *see* **blood coagulation**.

stable isotope an **isotope** that is not radioactive.

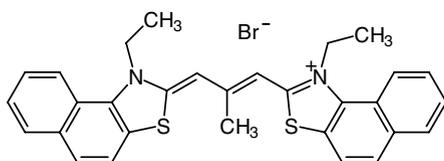

stachyose or **lupeose** the tetrasaccharide, *O*- α -D-galactopyranosyl-(1 \rightarrow 6)-*O*- α -D-galactopyranosyl-(1 \rightarrow 6)-*O*- α -D-glucopyranosyl- β -D-fructofuranoside, isolated from *Stachys tuberosa* rhizomes. It is widely distributed, usually associated with **raffinose** (*see* that entry for synthesis) and **sucrose**.

stacking gel *an alternative name for* **spacer gel**.

staggered conformation *see* **conformation**.

stainless steel steel that is resistant to corrosion due to its high content of chromium and, often, nickel. It is highly resistant to all organic acids and weak mineral acids but is slowly attacked by concentrated mineral acids. It does not rust.

Stains-all *a proprietary name for* 1-ethyl-2-[3-(3-ethylnaphtho[1,2-*d*]thiazolin-2-ylidene)-2-methylpropenyl]naphtho[1,2-*d*]thiazolium bromide; a cationic carbocyanine metachromatic dye used as a semiselective stain for locating nucleic acids, proteins, and polysaccharides. RNA stains bluish-purple, DNA blue, protein red, and phosphoprotein blue.

stamp collecting according to Lord Rutherford (1871–1937), one of the two branches of science (the other being physics).

standard (*in analytical chemistry*) **1 primary standard** a chemical that can be obtained in an unvarying state (e.g. of purity and/or stability) and used as an approved example against which other examples of the same chemical can be compared. **2 secondary standard** a chemical that can be used for comparative purposes following calibration against a primary standard. Although its properties are less stringent than a primary standard, its ready availability makes for convenience of use. *See also* **standard atmosphere**, **standard state**, **standard temperature and pressure**.

standard atmosphere an internationally established reference for

pressure, defined as 101 325 pascals. The **atmosphere** (def. 3) (*symbol:* atm), equal to 101 325 pascals, was formerly used as a unit of pressure; its use is now discouraged. *See also* **standard temperature and pressure**.

standard curve a plot of any appropriate parameter against known amounts (or concentrations) of detectable substance. Such a curve can be used to determine the amount (or concentration) of the same substance in an unknown solution given a reading for the parameter in the unknown solution.

standard deviation *abbr.:* SD; *symbol:* s (for a sample) or σ (for a distribution); the common measure of dispersion of a series of observations of x that is normally distributed. It is the root-mean-square average of the deviations of the observations from their mean and is in the same units as those of the observations. The standard deviation, s_x , is given by:

$$s_x = \sqrt{\left[\frac{1}{n} \sum_{i=0}^n (x - \bar{x})^2 \right]}$$

Where \bar{x} is the arithmetic average of deviations of x and n is the number of observations; s_x^2 is called the variance of the sample of observations of x . Some authorities prefer the definition:

$$s_x = \sqrt{\left[\frac{1}{n-1} \sum_{i=0}^n (x - \bar{x})^2 \right]}$$

so that s_x^2 is then the best estimate of the variance, σ^2 , of the population from which the sample of observations of \bar{x} was made. *See also* **degrees of freedom**, **standard error of estimate of the mean**.

standard error of estimate of the mean or **standard error of the mean** *abbr.:* SEM; a measure of the reliability of an estimate of the mean of a population. It is equal to the **standard deviation**, s_x , of the observations divided by the square root of the number of observations, n ; i.e. $\text{SEM} = s_x/\sqrt{n}$.

standard free energy *see* **Gibbs energy**.

standardize or **standardise** to relate any instrument, vessel, or reaction to an absolute standard. —**standardization** or **standardisation** *n*.

standard pressure *symbol:* p ; an established reference for pressure. Since 1982 the recommended standard pressure for reporting thermodynamic data has been set at 10^5 pascals (1 bar). Before 1982 it was taken to be 101 325 pascals (1 atmosphere).

standard state a set of conditions, established by convention, under which a standard reference is determined or calculated. *See* **chemical potential**, **enthalpy**, **entropy**, **Gibbs energy**, **hydrogen electrode**, **standard pressure**, **standard temperature and pressure**.

standard temperature and pressure *abbr.:* stp or s.t.p. or STP; the standard conditions for the comparison of properties of gases. Standard temperature is now 298.15 K (formerly 273.15 K, i.e. 0°C) and **standard pressure** is 10^5 pascals. *Former name:* normal temperature and pressure (*abbr.:* ntp or n.t.p. or NTP).

stanniocalcin a peptide of bony fishes that counteracts hypercalcemia and stimulates phosphate resorption in kidney.

Staphylococcus a genus of Gram-positive bacteria, commonly associated with wounds and generally causing localized infections. *Staphylococcus aureus* forms yellow or orange pigments and yields plasmids that are useful in recombinant DNA experimentation: *S. aureus* plasmids coding for resistance to various antibiotics can be transfected into *Escherichia coli* or into *Bacillus subtilis* where they are stable, replicate, and express antibiotic resistance. They have provided the basis from which improved vectors have been developed.

staphylokinase a noncatalytic protein (136 amino acids) produced by *Staphylococcus* spp. that binds to and activates plasminogen. It has no sequence similarity to streptokinase, and is used to dissolve blood clots.

StAR *abbr.* for steroidogenic acute regulatory; a protein of the mitochondrial matrix that is phosphorylated in response to cAMP released by corticotropin in the adrenal cortex and gonads. It plays a role in the entry of cholesterol into the matrix. Point mutations in the gene for StAR at 8p11.2 (which encodes 286 amino acids) result in congenital lipoid adrenal hyperplasia.

star activity the relaxation of specificity under nonoptimal conditions exhibited by some restriction endonucleases. They then cleave DNA sequences that are similar to but not identical with their defined recognition sequence.

starch the most important reserve polysaccharide found in plants. It has two components: **amylose**, which is a homopolymer of glucose units linked only by $\alpha(1 \rightarrow 4)$ bonds; and **amylopectin**, also a glucose homopolymer (branched) that contains $\alpha(1 \rightarrow 6)$ bonds as well as $\alpha(1 \rightarrow 4)$ bonds. Starch is synthesized in chloroplasts during active periods of photosynthesis, accumulating as starch grains. It is then converted to sucrose and translocated to storage organs, such as seeds and tubers, where it is re-formed. *Compare* **glycogen**.

starch (bacterial glycogen) synthase EC 2.4.1.21; *recommended name*: starch synthase; *systematic name*: ADPglucose:1,4- α -D-glucan 4- α -D-glucosyltransferase; *other name*: ADPglucose-starch glucosyltransferase. An enzyme that catalyses a reaction between ADPglucose and $(1,4\text{-}\alpha\text{-D-glucosyl})_n$ to form $(1,4\text{-}\alpha\text{-D-glucosyl})_{n+1}$ and ADP. It uses ADPglucose instead of the UDPglucose of **glycogen synthase**.

starch debranching enzyme *an alternative name for R-enzyme*.

starch phosphorylase *see* α -glucan phosphorylase.

starch synthase EC 2.4.1.11; *recommended name (example)*: glycogen (starch) synthase (the nature of the synthetic product should be included in the name); *systematic name*: UDPglucose:glycogen 4- α -D-glucosyltransferase; *other name*: UDPglucose-glycogen glucosyltransferase. An enzyme that catalyses a reaction between UDPglucose and $(1,4\text{-}\alpha\text{-D-glucosyl})_n$ to form $(1,4\text{-}\alpha\text{-D-glucosyl})_{n+1}$ and UDP. *See also* **glycogen synthase**. *Compare* **starch (bacterial glycogen) synthase**.

starch syrup *an alternative name for corn syrup*.

Stargardt macular dystrophy or **juvenile macular degeneration** an autosomal recessive condition that is the most common form of macular degeneration. It manifests in the pre-teen years and is caused by mutations in an ABC transporter protein, called ABCR (ABC transporter retina, or Rim protein; 2273 amino acids), that is found in rod photoreceptor outer segments. [After Karl Stargardt (1875–1927), German ophthalmologist.]

stargazin a protein (38 kDa) with four transmembrane segments that is essential for bringing AMPA receptor (an ionophoric glutamate receptor) to the postsynaptic membrane. Its intracellular C-terminal region binds to the postsynaptic protein PSD-95. It is homologous with the γ subunit of voltage-gated Ca^{2+} channels of muscle. Defects in the protein are the cause of stargazer mutant mouse.

Start an important checkpoint in the G_1 phase of the eukaryotic **cell-division cycle**. Passage through Start commits the cell to enter S phase.

start codon the trinucleotide **codon** AUG that codes for *N*-formylmethionine, the first amino-acid residue in the synthesis of all prokaryotic and mitochondrial proteins.

start kinase a complex of *cdc2* (*see cdc gene*) and a G_1 **cyclin** that is a serine/threonine protein kinase; its activation is necessary for the cell to pass **Start**. The identity of the G_1 cyclin modifies the specificity of the complex.

start point the base pair in DNA at which the first nucleotide is incorporated into an RNA transcript. It is usually a purine, and often is the central base of the sequence CAT. It is sited at the downstream end of the **promoter**. *Compare* **start codon**.

start protein any protein that is involved uniquely at the start of the cell cycle. For example, protein Cdc10 from *Schizosaccharomyces pombe* (which has a close homologue in *Saccharomyces cerevisiae*) is probably a transcriptional regulator for *cdc10* and also for *cdc2*, which encodes a component of **start kinase**.

starve to deprive of nutrients. In animal experiments a minimum of 24 h deprivation is generally understood. Cultures may be starved of specified single nutrients.

stasis arrest or stagnation of flow.

+stasis *comb. form* denoting lack of movement; cessation of flow. —+static *adj.*

STAT *abbr. for* signal transducer and activator of transcription; a family of eukaryotic transcription factors that mediate the response to many cytokines and growth factors. Upon receptor activation, STAT proteins dimerize, translocate to the nucleus, and bind to specific promoter sequences on target genes. Seven different genes have been so far identified in mammals. Example: STA1_HUMAN, 750 amino acids (87.33 kDa).

+stat *comb. form* indicating a device for maintaining a particular property at a constant value, e.g. **cryostat**, **thermostat**. —+static *adj.*

stathmin *other names*: phosphoprotein p19; oncoprotein p18; prosolin; a ubiquitous, phylogenetically conserved, cytoplasmic protein that serves as a phosphorylated intermediate in diverse second-messenger pathways. Stathmin undergoes phosphorylation; both phosphorylation and expression of the protein are regulated throughout development, in response to extracellular signals that control cell proliferation and differentiation. It is a major phosphorylation substrate in neurons.

+static *see* +stasis, +stat.

statics *functioning as sing.* the branch of applied mathematics dealing with the interaction of forces in nonmoving systems.

statin 1 a phosphoprotein present specifically in the nuclei of non-proliferating cells. It forms a complex with a 45 kDa serine/threonine protein kinase, and has structural similarity to the elongation factor EF-1a. **2** any of a class of drugs used to lower blood cholesterol levels through inhibition of hydroxymethylglutaryl-CoA reductase. Examples are Lipitor (atorvastatin) and Zocor (simvastatin). The effect of these drugs can be enhanced by the simultaneous administration of an agent, such as **cholestyramine**, that prevents the reabsorption of bile acids, thus increasing the conversion of cholesterol to bile acids. **3** a variant spelling of **statine**.

+statin *word ending (in hormone nomenclature)* denoting a hypothalamic release-inhibiting factor (or hormone). *Compare* +liberin.

statine or **statin** *symbol*: Sta; [3S,4S]-4-amino-3-hydroxy-6-methylheptanoic acid; a novel amino acid contained in positions 3 and 5 of **pepstain A**.

stationary phase 1 (*in chromatography*) the immobile phase to which the analyte adsorbs or partitions from the mobile phase. **2** (*in fermentation*) the phase of an *in vitro* culture of microorganisms or eukaryotic cells that follows the exponential growth phase and in which there is little or no growth.

statistically significant *see* **significant**.

statistical mechanics the theoretical analysis of molecular properties based on quantum theory.

statistical sample a finite selection of items from a population of which the measurement of a variable will give a close approximation to the distribution of that variable in the whole population. *See also* **random sample**, **sample**.

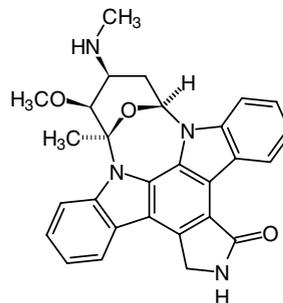

statistics 1 *functioning as sing.* the science of collecting, analysing, interpreting, and presenting quantities of numerical data. **2** *functioning as pl.* a collection of quantitative data. —statistical *adj.*

stator the part of the **H⁺-transporting ATP synthase** that is held fixed relative to the F_0 part during flow of hydrons through the latter. *Compare* **rotor**.

statyl the acyl group derived from **statine**.

Staufen a dsRNA-binding protein of *Drosophila* that is involved in localizing maternal mRNA in oocytes and the embryo. It contains five dsRNA-binding motifs (**dsRBMs**). Mouse and human homologues lack the first dsRBM, bind tubulin, and interact with the rough endoplasmic reticulum and with polysomes.

staurosporine an antibiotic from *Streptomyces* spp., M_r 466.2, best known as a potent inhibitor of protein kinase C.

Ste *symbol for the stearoyl group*, $\text{CH}_3-[\text{CH}_2]_{16}-\text{CO}-$.

steady state a condition in which the properties of any part of a system are constant during a process or reaction; i.e. where the rate of formation or increase of a particular quantity is balanced by its rate of removal or decrease.

steady-state fluorescence anisotropy a method in which a sample containing a fluorescent compound is irradiated with plane-polarized light, the emitted fluorescence being analysed to determine its degree of polarization both in the plane of the excitation radiation and in a plane at right angles to this. Only molecules of the fluorescent compound that are aligned in the plane of the incident radiation can absorb radiation and be excited to emit fluorescence. If, in the interval between absorption of the radiation and the emission of fluorescence, the molecule moves out of the plane of polarization of the incident radiation, the emitted radiation will lose polarization (be depolarized) to a degree that depends on the extent to which the molecule had moved. The technique is used to measure the degree to which fluorescent probes are tumbling in a sample. If the probes are held in a relatively rigid position, the extent of depolarization will be small, if tumbling freely it will be high.

steady-state kinetics the analysis of an enzyme reaction in the steady state, i.e. after the pre-steady state and when the intermediates have reached a steady concentration. The duration of the steady state is relatively short, and this state is in any case an approximation since the accumulation of products and the depletion of substrate occur continuously from the start of the reaction. *See Michaelis kinetics.*

steapsin *an old term for pancreatic lipase.*

stearate **1** a trivial name for octadecanoate, $\text{CH}_3-[\text{CH}_2]_{16}-\text{COO}^-$, the anion derived from stearic acid, or octadecanoic acid, a saturated straight-chain higher fatty acid. **2** any mixture of free stearic acid and its anion. **3** any salt or ester of stearic acid. *See also stearoyl.*

stearin **1** *an old name for any of the glyceryl esters of stearic acid, especially the triester, tristearin (tristearoylglycerol).* **2** a commercial name for a grade of stearic acid containing other fatty acids, especially palmitic acid.

stearoyl *symbol: Ste; numerical symbol 18:0; a trivial name for octadecanoyl, $\text{CH}_3-[\text{CH}_2]_{16}-\text{CO}-$, the acyl group derived from stearic acid (see stearate). A major fatty-acid component of plant and animal lipids; tallow and other hard animal fats contain up to 35%. Together with palmitate it represents a high proportion of the saturated fatty-acid content of dietary and other lipids. It is synthesized from palmitoyl-CoA by a microsomal chain-elongation enzyme. It is incorrectly referred to as stearyl.*

stearoyl-CoA desaturase EC 1.14.99.5; *systematic name: stearoyl-CoA:hydrogen donor:oxygen oxidoreductase; other names: acyl-CoA desaturase; fatty-acid desaturase; Δ^9 -desaturase.* An enzyme that catalyses a reaction between dioxygen, an electron donor and stearoyl-CoA to form oleoyl-CoA. It is an iron protein with a short half-life, and is the only inducible component of the endoplasmic reticulum fatty acyl-CoA desaturase system. It utilizes electrons from reduced cytochrome b_5 .

stearyl **1** a common name for octadecyl, $\text{CH}_3-[\text{CH}_2]_{16}-\text{CH}_2-$, the alkyl group derived from octadecane; octadecyl is recommended. **2** *an old trivial name for octadecanoyl; stearoyl is now recommended.*

steatite *see talc.*

steato+ *comb. form indicating presence or relation to fatty substances.*

steatorrhoea the presence of abnormally large amounts of fat in the feces.

steatosis fatty degeneration of tissue.

steel factor *see stem cell factor.*

steel factor receptor *see kit.*

stefin *see cystatin.*

Stelazine *see trifluoperazine.*

stellacyanin a blue, copper-containing mucoprotein of low molecular weight obtained from the Japanese lacquer tree, *Rhus vernicifera*. It functions as an electron-transfer protein, accepting electrons from the cytochrome b_6-f complex, and donating them to photosystem I, and has been much studied for the structure of the copper-binding site.

STEM *abbr. for scanning transmission electron microscope.*

stem cell any member of the various groups of reserve cells that replace cells destroyed during the normal life of the animal, e.g. blood cells, epithelial cells, spermatogonia, and skin cells. Stem cells can divide without limit; after division, the stem cell may remain as a stem cell or proceed to terminal differentiation.

stem cell factor (*abbr.: SCF*) or **mast cell growth factor** or **steel factor** a cytokine that stimulates the proliferation of mast cells. It is produced by endothelial cells, fibroblasts, bone marrow cells, and Sertoli cells. A homodimer glycoprotein with type I membrane and soluble forms, it enhances the proliferation of both myeloid and lymphoid hemopoietic progenitors. Its receptor is the membrane receptor-tyrosine kinase encoded by the protooncogene *c-kit* (*see KIT*).

stem cell marker any molecule, especially one expressed at the cell surface, that is used to distinguish stem cells from other cells; e.g. CD34.

stem name any generic name for a category of similar compounds, enzymes, organisms, etc. that is used also as an affix in forming the specific names of individual members of such a category.

steno+ or (*before a vowel*) **sten+** *comb. form indicating narrowness.*

stenohaline describing an organism that is unable to tolerate wide variations in environmental osmotic pressure.

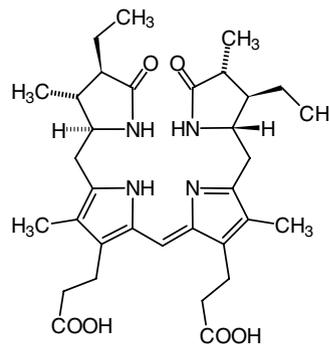

stenothermous describing an organism that is unable to tolerate wide variations in environmental temperature.

STEP *abbr. for sieve tube exudate protein.*

step gradient a discontinuous gradient, formed in a tube by layering solutions of different densities carefully one on the other. In column chromatography the same effect is achieved by pumping buffers of different composition sequentially through the column. *See gradient.*

steradian *symbol: sr; the SI supplementary unit of solid angle. It is equal to the angle subtended at the centre of a sphere by an area of surface equal to the square of the sphere's radius. The surface of a sphere subtends an angle of 4π sr at its centre.*

stercobilin or **stercobilin IX α** a linear red-brown tetrapyrrole formed in heme catabolism. Structurally it is an oxidation product of **stercobilinogen**. Metabolically, it is formed from urobilinogen by intestinal bacteria and is the major pigment of feces.

stercobilinogen *an alternative name for 10,23-dihydrostercobilin; former name, stercobilinogen IX α .* A product of heme catabolism; it is a **urobilinogen** molecule in which the double bonds between the methyl and ethyl substituents on the two end rings have been reduced.

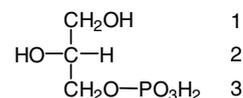

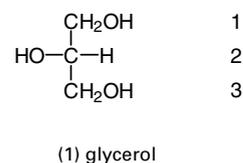

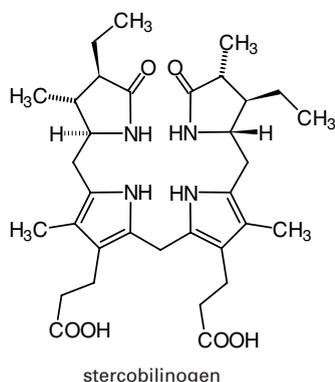

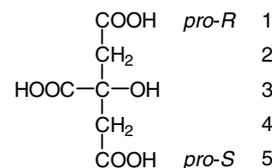

sterculic acid *see cyclic fatty acid.*

stereo+ *comb. form denoting solid or three-dimensional.*

stereobase unit the smallest set of one, two, or more successive **configurational base units** that prescribes repetition in a polymer molecule.

stereochemistry the branch of chemistry dealing with the three-dimensional properties of molecules; the study of the properties of **stereoisomers**. *See cis-trans isomerism, Re/Si convention, sequence rule, stereospecific numbering.*

stereoheterotopic a term describing chemically-like ligands (or faces of double bonds) whose separate replacement with an achiral ligand (or for faces, addition of an achiral reagent) gives rise to two stereoisomers. If the stereoisomeric products are **enantiomers**, the

(2) *sn*-glycerol-3-phosphate

(3) citric acid

ligands (faces) are enantiotopic; if they are diastereoisomers, the ligands (faces) are diastereotopic. for more extensive descriptions, see diastereotopic, enantiotopic.

stereoisomer any of two or more **isomers** that have the same molecular constitution and differ only in the three-dimensional arrangement of their atomic groupings in space. Stereoisomers may be **diastereoisomers** or **enantiomers**. Compare **constitutional isomer**. —**stereoisomeric** *adj.*; **stereoisomerism** *n.*

stereology the body of mathematical methods dealing with the interpretation of the structure and dimensions of three-dimensional objects from information contained in two-dimensional representations, such as photomicrographs of tissue sections.

stereoregular polymer a regular polymer composed of molecules having a regular repetition of identical **stereobase units** at all stereoisomeric sites of the main chain.

stereoselective polymerization the formation of a polymer from a mixture of stereoisomeric monomer molecules by preferential incorporation of one species into a growing polymer chain.

stereospecific (of an enzymatic or other reaction system) acting on or producing a particular **stereoisomer**; stereochemically specific. —**stereospecificity** *n.*

stereospecific numbering a numbering system applied mostly to prochiral compounds, *Caabc*, with two similar atoms, or groups of atoms, *a*. *a* numbers the prochiral *a* groups and, by extension, their chiral derivatives. A stereospecifically numbered compound is designated by the prefix *sn*-. The Hirschmann system was devised particularly so that the ¹⁴C-labelled glycerol giving rise to [3,4-¹⁴C₂]glucose (in rats) could be termed [1-¹⁴C] glycerol and thus be related, biosynthetically and by nomenclature, to [1-¹⁴C]lactate. It uses the basic *R/S* system (see **sequence rule**) to set up a model, which is viewed away from the group with the lowest sequence priority. If this is *c* in *Caabc*, a counterclockwise ordering is examined for the remaining three groups, *baa*, starting with *b*. The first *a* group to be encountered receives the lower number. The numbering for glycerol is shown in structure 1. By extension, the glycerol phosphate formed by **glycerol kinase** becomes *sn*-glycerol 3-phosphate (structure 2). This structure has also been described as *D*-glycerol 3-phosphate, *L*-glycerol 3-phosphate, and *L*- α -glycerophosphate. The Hirschmann nomenclature has found wide acceptance in the lipid field. The Hanson and Hirschmann system expands the *R/S* system in a logical fashion (rather than using the arbitrary counterclockwise ordering described for glycerol). The two similar groups, *a*, of *Caabc* are first given *pro-R* and *pro-S* assignments. Then, following the established 'R precedes S rule', *pro-R* precedes *pro-S*, and the *pro-R* group is assigned the lower number. This system has been applied to citric acid as shown in structure 3. Application of this system to glycerol unfortunately leads to the product of glycerol kinase being *sn*-glycerol 1-phosphate. Although this system has a logical basis in terms of established nomenclature, it seems unlikely that the *sn* system for glycerol and derivatives will be brought into line.

stereospecific polymerization a polymerization in which a **tactic polymer** is formed.

steric relating to effects involving arrangements of atoms in space.

steric hindrance **1** prevention of the free rotation of an atom or group in a molecular entity with respect to a connected one due to the relative sizes and/or spatial disposition of the atoms or groups in question. **2** restriction or prevention of the reaction of a molecular entity with another due to the relative sizes and/or spatial disposition of atoms or groups in either or both of the reactants.

sterilant a substance that destroys or eliminates all forms of microbial life in the inanimate environment, including bacteria, bacterial spores, fungi, fungal spores, and viruses. Compare **disinfectant**, **sanitizer**.

sterile **1** (of inanimate objects) free from microbiological or other life forms. **2** (of a living organism) incapable of sexual reproduction.

sterilize or **sterilise** **1** to treat in such a way as to kill undesired microorganisms without damaging the material under treatment. Compare **disinfection**. **2** to render incapable of sexual reproduction. —**sterilization** or **sterilisation** *n.*

Stern-Volmer equation an expression relating **fluorescence quenching** to the concentration of the quenching substance, *c*, and the fluorescence lifetime, τ . It is: $F_0/F = 1 + kc\tau$, where F_0 is the fluorescence intensity when no quencher is present, *F* is the fluorescence intensity in the presence of quencher, and *k* is a constant that depends on the system; the concentration of the absorbing molecule must be the same in both quenched and unquenched systems. The **Stern-Volmer plot** is a plot of F_0/F against concentration of quenching substance, from the slope of which, if the fluorescence lifetime is known, the quenching constant can be obtained. [After Otto Stern (1888–1969) and M. Volmer].

steroid any of a large group of substances that have a ring system based on 1,2-cyclopentanoperhydrophenanthrene. The group includes such natural products as **bile acids**, **corticosteroids**, **sex hormones**, **sterols**, and various plant steroids. See also **vitamin D**.

steroid diabetes the combination of decreased glucose tolerance, fasting hyperglycemia, and glucosuria, found in patients exposed to

excessive quantities of **glucocorticoids**. It may thus accompany **Cushing's syndrome**.

steroid-hormone receptor any intracellular receptor that binds steroid hormones and mediates their effects; the family also includes receptors for thyroid hormones, retinoids, and vitamin D. After the steroid enters the cell, the steroid-receptor complex is translocated to the nucleus and binds to a specific DNA sequence, a **response element**. The receptors contain a modulating N-terminal domain, a zinc finger DNA-binding domain, and a C-terminal steroid-binding domain.

steroid Δ -isomerase EC 5.3.3.1; *systematic name*: 3-oxosteroid Δ^5 - Δ^4 -isomerase; *other name*: Δ^5 - Δ^4 -ketosteroid isomerase. An enzyme involved in microbial transformation of steroids; it catalyses the reaction:

steroid 21-monooxygenase EC 1.14.99.10; *other names*: steroid 21-hydroxylase; cytochrome P450 21A1; an enzyme that catalyses a 21-hydroxylation of progesterone to 11-deoxycorticosterone and of 17-hydroxyprogesterone to 11-deoxycortisol in the fasciculata/reticularis region of the adrenal cortex. It is a heme-thiolate protein. Mutations that decrease its activity result in congenital adrenal hyperplasia: there is a failure to synthesize cortisol, and this results in overproduction of **corticotropin**, 17-hydroxyprogesterone, and androstenedione.

steroid 11 β -monooxygenase EC 1.14.15.4; *other names*: steroid 11 β -hydroxylase; cytochrome P45011B1 (or CYP11B1); cytochrome P45011B2 (or CYP11B2). Either of the enzymes found in the mitochondrial matrix of adrenal cortical cells that are involved in production of cortisol and aldosterone. CYP11B1 converts 11-deoxycorticosterone to corticosterone and 11-deoxycortisol to cortisol, in the zona fasciculata and zona reticularis. CYP11B2 also has **aldosterone synthase** activity, converting corticosterone to aldosterone in the zona glomerulosa. Mutations in CYP11B1 lead to congenital adrenal hyperplasia, whereas mutations in CYP11B2 lead to aldosterone deficiency.

steroid 17 β -monooxygenase EC 1.14.99.9; *other names*: steroid 17 β -hydroxylase; cytochrome P45017. An enzyme of the endoplasmic reticulum occurring in the zona fasciculata and zona reticularis of adrenal cortex and in the gonads. It catalyses the following conversions:

- (1) progesterone \rightarrow 17 β -hydroxypregnenolone \rightarrow 17 β -dehydroepiandrosterone;
- (2) progesterone \rightarrow 17-hydroxyprogesterone \rightarrow androstenedione.

Both reactions involve sequential 17 β -hydroxylation and 17,20-lyase reactions. Mutations that decrease both activities results in congenital adrenal hyperplasia.

steroidogenesis the biosynthesis of steroids, but often referring to the genesis of other steroids from cholesterol.

steroidogenic factor 1 *abbr.*: SF-1; a protein of the nuclear receptor family of zinc finger transcription factors that regulates tissue-specific expression of P450 steroid hydroxylases, 3 β -hydroxysteroid dehydrogenase, ACTH receptor, StAR, and anti-Müllerian hormone. It is expressed in gonads and adrenal glands from the earliest stages of development, and in the hypothalamus and anterior pituitary gland of mouse and human. Gene knockout in mice results in lack of adrenal glands and gonads.

steroid 5 α -reductase or 3-oxo-5 α - Δ^4 -dehydrogenase either of two enzymes that catalyse the reaction: testosterone + NADPH + H⁺ \rightarrow 5 α -dihydrotestosterone + NADP⁺. One of the enzymes, 5 α -reductase 1, has an alkaline pH optimum and is found in liver and skin. The other, 5 α -reductase 2, has an acid pH optimum and is found in the male urogenital tract. Many mutations resulting in 5 α -reductase 2 deficiency cause an autosomal recessive form of testicular feminization syndrome.

sterol any **steroid** that contains one or more hydroxyl groups and a hydrocarbon side-chain in the molecule.

sterol O-acyltransferase EC 2.3.1.26; *other names*: cholesterol acyltransferase; sterol-ester synthase; an intracellular enzyme that catalyses the formation of cholesterol ester from acyl-CoA and cholesterol. It is involved in the storage of cholesterol esters in phago-

cytic cells, a process that plays a part in producing lipid-laden cells in arterial walls. There are two isozymes in yeast. The enzyme belongs to the superfamily of membrane-bound O-acyltransferases.

sterol carrier protein 2 *abbr.*: SCP2; a protein (123 amino acids) required for intracellular sterol transport. It may be a cofactor for the endoplasmic reticulum enzyme 3 β -steroid- Δ^7 -reductase (EC 1.3.1.21), which converts 7-dehydrodesmosterol to desmosterol in the final stages of cholesterol biosynthesis. SCP2 is produced from a short transcript that forms part of a long transcript encoding SCPx, and also by cleavage of SCPx in the peroxisomal matrix – the C-terminal region of SCPx contains SCP2.

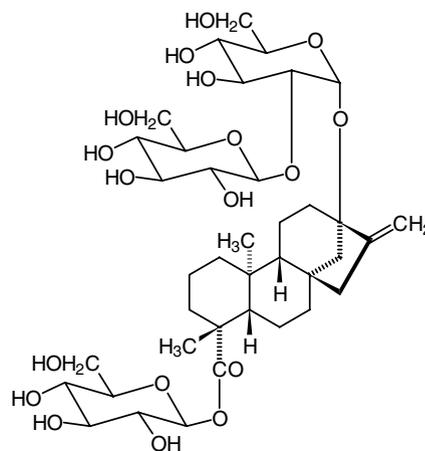

sterol 27-monooxygenase or **sterol 27-hydroxylase** or **cytochrome P45027** or **CYP27**. A mitochondrial cytochrome P450 enzyme (498 amino acids) that catalyses hydroxylation of the C27 in the side chain of cholesterol or of dihydroxycholestane. This is the first step in the degradation of this side chain in the biosynthesis of bile acids. Many mutations lead to enzyme deficiency and cerebrotendinous xanthomatosis.

sterol-response-element binding protein *see* **SREBP**.

sterol-sensing domain a hydrophobic domain of proteins that binds cholesterol. *See* **SREBP**.

steryl-sulfatase EC 3.1.6.2; *other names*: steroid sulfatase (sulfatase); steryl-sulfate sulfohydrolase; arylsulfatase C; an enzyme that catalyses the hydrolysis of 3- β -hydroxyandrost-5-en-17-one 3-sulfate to 3- β -hydroxyandrost-5-en-17-one and sulfate.

stevioside 13-[(2-O- β -D-glucopyranosyl- α -D-glucopyranosyl)-oxy]kaur-16-en-18-oic acid β -D-glucopyranosyl ester; a glycoside extracted from the leaves of *Stevia rebaudiana* (yerba dulce). It is used as a sweetening agent, being about 300 times as sweet as sucrose.

STH *abbr.* for somatotrophic hormone; *see* **somatotropin**.

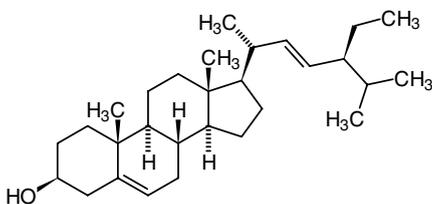

STI *abbr.* for soybean trypsin inhibitor.

Stickler syndrome or **arthro-ophthalmodystrophy** an autosomal dominant chondrodysplasia in which early joint degenerative disease is accompanied by disorders of the eye and deafness. Mutations in genes for collagens XI α -1, XI α -2, and II α -1 are responsible. [After Gunnar Stickler (1925–), US physician.]

sticky end *see* **cohesive end**.

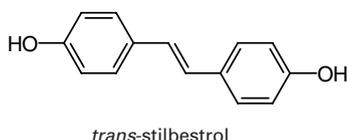

stiff-man syndrome or **stiff-person syndrome** a rare progressive rigidity of the body musculature. In \approx 60% of patients autoantibodies to glutamate decarboxylase are present in plasma and cerebrospinal fluid, and in \approx 58% of patients diabetes mellitus type 1 is also present. The muscular hyperactivity is suppressed by sleep, anesthesia, GABA agonists, or curare.

stigmasterol 3 β -hydroxy-24-ethyl- Δ^5 ,²²-cholestadiene; a **phytosterol** structurally related to β -sitosterol (*see* **sitosterol**) and found in plant oils.

stilbene or **1,2-diphenylethene** an unsaturated hydrocarbon, $C_6H_5CH=CHC_6H_5$, several derivatives of which occur in plants, where they protect against bacterial and fungal pathogens, discourage herbivory, inhibit seed germination, and function as growth inhibitors and in dormancy. Combrestatin and resveratrol are substituted stilbenes.

stilbestrol or (*esp. Brit.*) **stilboestrol** 4,4'-dihydroxystilbene; a synthetic nonsteroid compound, first prepared in 1938, that became a source of a range of compounds with estrogenic activity, of which α,β -diethylstilbene (*see* **diethylstilbestrol**) is the most active. Stilbestrol has been used as a growth promoter in farm animals but is now banned in most countries. It is still used to treat hormonal disorders in small animals. It was formerly used to treat prostatic cancer but there is some evidence for its carcinogenicity.

still an apparatus for the distillation of liquids, including the preparation of distilled water. It consists of a heated vessel, a condenser, and a receiver. A continuous apparatus incorporates an automatic feed for the liquid in question, a heating element, and a thermoregulator.

stimulate (*in physiology*) to provide a **stimulus** to any tissue or cell leading to its excitation or to initiation of a sequence of events with some defined endpoint, involving an electrical event, activation of a metabolic pathway, or initiation of cell division or growth. —**stimulation** *n.*; **stimulative** *adj.*

stimulus (*in physiology*) any event or phenomenon, such as radiation, electrical potential, or addition of molecules that leads to excitation of a tissue or cell.

stimulus-response coupling a molecular mechanism, often involving **signal transduction**, that transmits a stimulus from the exterior of a cell's plasma membrane, in many cases through **second messenger** pathways, to effector systems that bring about a response. For example, in **stimulus-secretion coupling** the effector system brings about a secretion event such as degranulation of mast cells or release of hormone (e.g. insulin) from storage granules to the cell exterior.

stimulus-secretion coupling *see* **stimulus-response coupling**.

stochastic arrived at by skilful conjecture; e.g. a stochastic model, a stochastic process.

stock solution a solution of a reagent, at a stable or convenient concentration, from which appropriate dilutions can be made at the time of use.

Stock system (*in inorganic nomenclature*) a system of designating the **oxidation number** of an element by placing a Roman numeral in parentheses immediately following the name of the element or, where symbols are used, in superscript to the right of the symbol; e.g. manganese(IV) oxide, $Mn^{IV}O_2$.

stoichiometry or (*rarely*) **stoicheiometry** the quantitative relationship of the reactants and products of a chemical reaction in the proportions that they appear in the chemical equation describing the reaction. —**stoichiometric** or **stoicheiometric** *adj.*

stokes *symbol:* St; the cgs unit of **kinematic viscosity**; its use is now discouraged. In SI units, kinematic viscosity is measured in square metres per second; $1 \text{ St} = 10^{-4} \text{ m}^2 \text{ s}^{-1}$. [After (Sir) George Gabriel Stokes (1819–1903), British mathematician.]

Stokes' law of fluorescence a law stating that the wavelength of the emitted fluorescent light, λ_{em} , is greater than that of the light exciting the fluorescence, λ_{ex} . This relationship is true for most fluorescent materials; those for which it does not hold are termed **anti-Stokes**.

Stokes' law of viscosity a law stating that the frictional coefficient, f , of a spherical particle of radius r , moving through a liquid of viscosity η , is given by $f = 6\pi\eta r$.

Stokes' loss the loss of excitation energy available for fluorescence due to collision of molecules in the first excited state, S_1 , with their neighbours, which results in a lower vibration level of S_1 .

Stokes' shift the difference in wavelength between the excitation and emission maxima for a particular fluorescent substance. In quantitative form, Stokes' shift is $10^7(1/\lambda_{ex} - 1/\lambda_{em})$, where λ_{ex} and λ_{em} are the corrected maximum wavelengths for excitation and emission expressed in nanometres.

stoma (*pl. stomata*) any of the pores in the epidermis of plants, particularly in leaves, through which gaseous exchange takes place.

stomatin or **band 7.2b protein** a major membrane protein of human erythrocytes that contains a central domain also found in prohibitins and flotillin. It is lacking in an autosomal dominant form of hemolytic anemia (hereditary stomatocytosis).

stop codon any of the trinucleotide **codons**, UGA, UAG, and UAA, that signal the termination of translation of a messenger RNA molecule and the release of the nascent polypeptide chain.

See also **termination codon**.

stopped-flow technique a method in which two solutions are caused to flow into a mixing chamber and then into an observation chamber, after which the flow is stopped abruptly and the chemical reaction is followed, usually spectroscopically, as the mixture in the observation chamber ages. Critical features include the quality of mixing, the speed with which the mixed solution fills the observation chamber, and the geometry of the observation chamber in relation to the sensitivity of observation. *See also* **rapid-reaction kinetics**.

STOP protein *abbr. for* stable tubule only polypeptide; a protein that blocks the endwise dissociation of microtubules.

stop-transfer protein or **stop-transfer sequence** *see* **signal peptide**.

storage granule any small **organelle**, bounded by a lipid-bilayer membrane, that contains stored material. For example, mast-cell storage granules contain histamine, while those of pancreatic B cells contain insulin; in both cases the stored material is destined for secretion. This involves a stimulus that causes fusion of the granule membrane with the plasma membrane, followed by release of the granule contents by **exocytosis**.

storage polysaccharide any polysaccharide that serves as a form of stored energy in living organisms. Storage polysaccharides include starch, phytylglucogen (e.g. in maize), and fructosans (e.g. inulin) in plants, and glycogen in animals.

stp or **s.t.p.** or **STP** *abbr. for* standard temperature and pressure.

straight-chain describing any chain of carbon atoms in which none of the carbon atoms is directly bonded to more than two other carbon atoms.

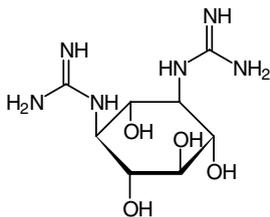

strain 1 a group of related individuals having certain characters that distinguish the members from other such groups within the same species or variety; a race. **2** a line of organisms descended or derived from a particular ancestral individual. **3** (*in physics*) the temporary or permanent deformation of a body resulting from an applied stress.

streptavidin a tetrameric biotin-binding protein (subunit M_r 14 500), produced by *Streptomyces avidinii*, that binds up to four molecules of **biotin** per molecule. It is used in enzyme-linked immunosorbent assay (ELISA), radioimmunoassay, immunocytochemistry, and protein blotting. It is also used to detect DNA probes that contain bound biotin. The streptavidin may be labelled with **FITC**, gold, peroxidase, or another agent. Alternatively, a biotin-labelled detection system (such as alkaline phosphatase) can be bound to streptavidin through another of its biotin-binding sites. Streptavidin has the advantage over **avidin** of having a near-neutral

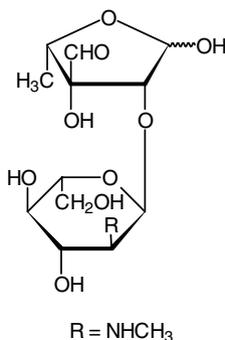

streptidine

isoelectric point (7.25–7.45), with consequently less nonspecific binding. *See also* **biotinylation**.

streptidine 1,3-diguanido-2,4,5,6-cyclohexanetetrol; the non-carbohydrate component of **streptomycin**.

streptobiosamine 5-deoxy-2-*O*-[2-deoxy-2-(methylamino)- α -L-glycopyranosyl]-3-*C*-formyl-L-lyxose; a disaccharide component of **streptomycin**, containing **streptose** and *N*-methylglucosamine.

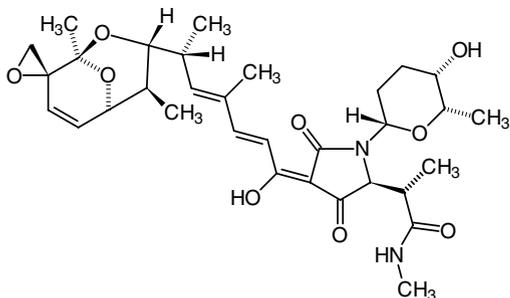

Streptococcus a genus of Gram-positive, facultatively or obligately anaerobic cocci or coccoid bacteria that produce **streptokinase**, **streptolysin**, and **streptodornase**.

streptodornase any of at least four deoxyribonucleases produced by streptococci. They have the characteristics of **deoxyribonuclease I** (EC 3.1.21.1), cleaving DNA to 5'-phosphodinucleotide and 5'-phosphooligonucleotide end-products. [From streptococcal deoxyribonuclease.]

streptokinase a noncatalytic protein secreted by certain streptococci that binds to and activates **plasminogen**, thus converting it to plasmin, which in turn lyses fibrin clots. It has been used therapeutically after heart attacks and strokes. It shows no sequence similarity to staphylokinase.

streptolydigin an antibiotic, derived from *Streptomyces lydicus*, that is particularly potent against anaerobes and some Gram-positive aerobes. It inhibits **RNA polymerase**, thereby reducing the rate of transcription, and slowing the rate of phosphodiester bond formation without affecting the fidelity of transcription. This contrasts with **rifampicin**, which inhibits initiation. *Compare* **rifampicin**.

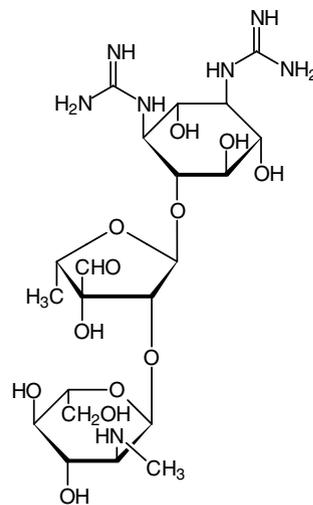

**streptovaricin**

streptolysin either of two **hemolysins** produced by certain streptococci (particularly of group A). **Streptolysin-O** (oxygen-sensitive) is produced in serum-free medium. Its hemolytic activity is destroyed by oxygen (but restored by certain mild reducing agents, e.g. 2-mercaptoethanol) and inhibited by free cholesterol. It is immunogenic, the level of circulating antibody (**antistreptolysin-O**, ASO) being useful in the diagnosis of streptococcal infections. Streptolysin-O can also lyse lysosomes. It resembles O-toxin of *Clostridium perfringens*, and can be used as an agent to permeabilize cells. **Streptolysin-S** (serum-dependent) is oxygen-insensitive and its production is promoted by serum proteins. Its hemolytic activity is inhibited by phosphatidyl ethanolamine at low concentration. It is nonimmunogenic, and is also toxic to leukocytes.

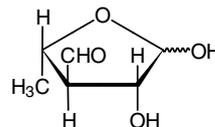

Streptomyces a genus of filamentous, spore-forming, Gram-positive bacteria that are largely responsible for the 'earthy' smell of soil but are chiefly remarkable for the diversity of secondary metabolites that they produce, including clinically useful antibiotics, e.g. **streptomycin**. They are amenable to genetic manipulation with many plasmid and phage vectors; this provides a unique opportunity for overexpression and for the design and synthesis of novel and 'hybrid' antibiotics. *See also* **streptomycete**.

streptomycete strictly, any member of the bacterial genus *Streptomyces*. However, the term may include certain related types, including *Streptoverticillum* spp.

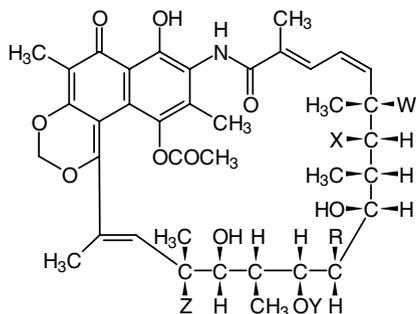

streptomycin an **aminoglycoside antibiotic** produced by the soil bacterium *Streptomyces griseus*, having a relatively broad spectrum of activity but particularly active against mycobacteria (especially *Mycobacterium tuberculosis*), enterobacteria, and staphylococci. It binds the 30S ribosomal subunit and distorts the A site (**aminoacyl site**), thereby causing miscoding or prevention of binding of aminoacyl-tRNA. The components of streptomycin are **streptidine**, **streptose**, and *N*-methyl-L-glucosamine.

streptose L-streptose; 5-deoxy-3-*C*-formyl-L-lyxose; a component of **streptomycin** and **streptobiosamine**.

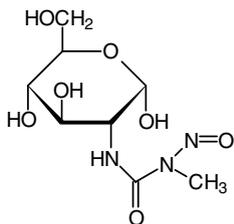

streptovaricin any **ansamycin** antibiotic obtained from *Streptomyces spectabilis*. *Compare* **rifampicin**.

Streptovaricin	W	X	Y	Z	R
A	OH	OH	Ac	OH	COOCH ₃
B	H	OH	Ac	OH	COOCH ₃
C	H	OH	H	OH	COOCH ₃
D	H	OH	H	H	COOCH ₃
E	H	O=	H	OH	COOCH ₃
G	OH	OH	H	OH	COOCH ₃
J	H	OAc	H	OH	COOCH ₃
K	OH	OAc	H	OH	COOCH ₃

streptozocin 2-deoxy-2-(3-methyl-3-nitrosoureido)-D-glucopyranose; a broad-spectrum antibiotic, antineoplastic, and diabetogenic substance isolated from *Streptomyces achromogenes*. It has a rapid and specific cytotoxic effect on the B cells in pancreatic islets, and is used to induce experimental diabetes in animals and for chemotherapy of insulinoma or other islet-cell neoplasms in humans. It acts as a methylating agent for DNA.

α -D-streptozocin

stress-activated protein kinase (abbr.: SAPK) an alternative name for JNK.

stress-associated protein kinase abbr.: SAPK; an alternative name for JNK.

striated muscle muscle in which the **thick filaments** and **thin filaments** are arranged in microscopically visible bands producing a striped appearance. Such an arrangement is typical of skeletal muscle and cardiac muscle. *Compare* **smooth muscle**. *See also* **sarcomere**.

strict aerobic *see* **aerobe**.

strict anaerobe *see* **anaerobe**.

stringency (*in molecular biology*) the rigour with which the ability of complementary DNA sequences to recognize each other (and thus to hybridize) is tested. It is affected by temperature, ionic strength, and the presence of destabilizing agents such as formamide. As temperature is increased it becomes less likely that more distantly related sequences will hybridize; hence, high stringency is associated with high temperature. Low ionic strength also gives high stringency.

stringent very rigorous. *See also* **stringency**, **stringent control**, **stringent plasmid**, **stringent response**.

stringent control a mechanism of control of plasmid replication

whereby the plasmid is replicated only once for each time the chromosome is replicated, thus regulating the plasmid copy number.

stringent factor a protein associated with ribosomes, and encoded by the gene *relA*, that is associated with the **stringent response**. It is an enzyme that donates a pyrophosphate group to 3' of either 5'-GTP or GDP to produce pppGpp and ppGpp, which probably act as allosteric modulators mediating the stringent response. *See also* **relaxed mutant**, **spoT**.

stringent plasmid a plasmid that has a limited number of copies per cell.

stringent response a response by bacteria to poor growth conditions (e.g. lack of amino acids) in which the cell shuts down protein synthesis and other metabolic activity. *See also* **relaxed mutant**, **stringent factor**.

strip 1 to remove adherent, admixed, or combined substances or material from a fundamental, underlying, or required substance or structure. **2** (*in molecular biology*) **a** to remove polysomes from rough endoplasmic reticulum *in vitro* to produce **stripped membranes** (*see* **degranulation** (def. 2)). **b** to remove ribosomal proteins from a ribosome to produce a **core particle**. **c** to remove the amino acid from an aminoacyl-transfer RNA molecule to produce **stripped transfer RNA**. **d** to remove hybridized **probe** (def. 3) from a **transfer membrane** prior to reprobing. **3** (*in biochemistry*) to remove endogenous 2,3-bisphosphoglycerate from a hemoglobin solution to produce **stripped hemoglobin**. **4** to remove liquid components from a gaseous mixture.

stripped hemoglobin a hemoglobin solution from which endogenous 2,3-bisphosphoglycerate has been removed, e.g. by gel filtration, or dialysis at high NaCl concentrations.

stripped membrane rough endoplasmic reticulum from which polysomes have been removed *in vitro* by treatment with EDTA.

stripped transfer RNA a molecule of aminoacyl-transfer RNA from which the amino acid has been hydrolytically removed.

stRNA abbr. for small temporal RNA; a form of microRNA (*see* **miRNA**) that is ≈ 22 nt long and derived from dsRNA by the endonuclease activity of **Dicer** and **Argonaute**. It is highly conserved in certain animals and controls developmental events.

stroma (*pl. stromata*) **1** fibrous connective tissue or other intercellular material that forms the structural framework of an organ, as opposed to the functional tissue (parenchyma). **2** the spongy framework of protein strands within a red blood cell in which the hemoglobin is packed. **3** (*in botany*) the space enclosed by the double membrane of a **chloroplast** but excluding the thylakoid space. It contains DNA, ribosomes, and some temporary products of photosynthesis. **4** (*in mycology*) a mass of interwoven hyphae in which fruiting bodies (perithecia) develop. —**stromal** *adj.*

stromelysin EC 3.4.24.17; *other names*: matrix metalloproteinase-3 (abbr.: MMP-3); transin-1; an enzyme that catalyses the degradation of fibronectin, laminin, and some gelatins and collagens. Zn²⁺ and Ca²⁺ are cofactors. It is a glycoprotein of the extracellular matrix. Stromelysin 1 is secreted by fibroblasts; stromelysin 2 is secreted by keratinocytes.

strong acid an acid that remains ionized except at the lowest pH values, i.e. one that has a large **acid dissociation constant**.

strong base a base that remains ionized except at the highest pH values, i.e. one that has a large **basic dissociation constant**.

strophanthin a highly toxic glycoside mixture produced by *Strophanthus kombe*, with actions similar to those of **digoxin** and **ouabain**.

structural gene any gene that carries the genetic information for the structure of a protein. One or more structural genes may be contained in an **operon**. *Compare* **regulator gene**.

structural genomics the systematic effort to determine the 3D structures of all proteins encoded in complete genomes.

structural polysaccharide any polysaccharide of plant cell walls that performs a structural function. There are three solubility classes: **pectins**, extractable with dilute acid; **hemicelluloses**, extractable with aqueous alkali; and **microfibrillar polysaccharides**.

structure-based alignment the alignment of protein sequences made on the basis of structure comparison. Structure-based alignments do not always respect patterns of sequence conservation and may consequently differ from sequence alignments. They should

not be considered the 'right' answer (or 'gold standard') – they merely reflect a different model of protein comparison, usually used for different purposes from those of sequence-based alignments. See **structure comparison**.

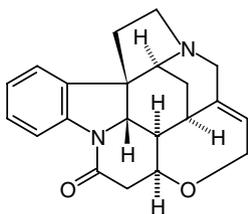

structure classification database a database in which protein structures are classified according to their geometrical and evolutionary similarities. Structures tend to be classified at the level of their individual domains, but multidomain structures can also be classified into evolutionary families and superfamilies. Examples of such databases include SCOP (structural classification of proteins) and CATH (class architecture topology homology).

structure comparison the comparison of protein folds by superposition of equivalent alpha or beta carbon atom coordinates. Equivalence of positions is largely determined by comparing the similarities of the properties or relationships of the residues or secondary structures. The quality of the structural superposition is measured in terms of the root mean square deviation (RMSD) (typically 4 Å or less for similar folds). Structure comparison is important, e.g., for detecting relationships between proteins that are not evident at the sequence level owing to their extreme divergence.

structure database a database that houses the 3D structural coordinates of biological macromolecules, as determined by X-ray crystallography, nuclear magnetic resonance (NMR), electron microscopy and/or molecular modelling. The PDB (Protein Data Bank) is the global repository for macromolecular structure information of the RCSB (Research Collaboratory for Structural Bioinformatics). The MSD (Macromolecular Structure Database), derived in part from the PDB, is the structure database of the European Bioinformatics Institute (EBI). The MMDB (Molecular Modelling Database) is the NCBI's (National Center for Biotechnology Information) subset of 3D structures obtained from the PDB, excluding theoretical models. The PDBj (Protein Data Bank Japan) is the subset of PDB from the Institute for Protein Research in Osaka University.

structure factor a parameter describing the scattering of electromagnetic radiation (e.g. X-rays) by an electron. It is the ratio of the radiation scattered by any real sample to that scattered by a single electron at the origin.

strychnine a bitter alkaloid obtained from seeds of the Indian tree *Strychnos nux-vomica*. It is highly toxic, and is sometimes used to poison moles, rodents, and other vermin. It causes convulsions by antagonizing the inhibitory transmitter, glycine, in the spinal cord (see **glycine receptor**). See also **brucine**.

STS *abbr.* for sequence-tagged site.

Stuart factor or **Stuart–Prower factor** an alternative name for factor X; see **blood coagulation**. [After a Mr Stuart, in whom the deficiency was first described.]

Student's *t* test a statistical test, based on a distribution due to William Sealy Gosset (1876–1937) writing in 1908 under the pseudonym 'Student', that can be applied to small samples of data, *x*. In this distribution *t* depends only on the sample size, *N*, and not on the variance of the population; as *N* increases, the distribution curve of *t* approaches a normal distribution curve more closely.

STX *abbr.* for saxitoxin.

sU *symbol* for a residue of the ribonucleoside thiouridine (when the position of the thiol group in its thiouracil moiety is unspecified or unknown; alternative to S or Srd).

s²U *symbol* for a residue of the ribonucleoside 2-thiouridine (alternative to ²S).

s⁴U *symbol* for a residue of the ribonucleoside 4-thiouridine (alternative to ⁴S).

sub *jargon term* for **subculture** (def. 1).

sub+ *prefix* 1 beneath, under, at the bottom (of). 2 immediately below in order, rank, or status; secondary. 3 less than, partial(ly), imperfect(ly). 4 in place of. 5 denoting a subordinate part or subdivision of a whole. 6 (in *chemical nomenclature*) designating a compound that contains less than the usual proportion of a specified element; e.g. carbon suboxide, C₂O₃. Compare **infra-**, **super-**.

subcellular describing organelles, functional units, or other components that are found within cells or derived from cells.

subcellular organelle a pleonasm that is commonly used to describe **organelles** (which by definition are subcellular).

subclone to clone into a new vector a subfragment of part of a larger cloned DNA, after excising the required fragment using restriction endonucleases.

subculture 1 to prepare a fresh culture from a small sample of an existing culture. 2 a culture prepared in such a way.

subcutaneous *abbr.*: s.c.; below the skin.

suberin the polymeric substance that covers the epidermal cell layer in the underground parts of plants (e.g. roots and tubers), and in stem epidermis, cork cells of the periderm, and surfaces of wounded cells. It is a polyester containing very-long-chain ω-hydroxy fatty acids and dicarboxylic acids, and phenolics such as *p*-coumaric and ferulic acids. The core is lignin-like and has attached long-chain hydrocarbons.

sublime to vaporize from the solid without passing through a liquid phase. — **sublimation** *n*.

submaxillary protease an endopeptidase isolated from the submaxillary gland of mice. It cleaves Arg-|-Xaa bonds.

submaxillary relating to the region beneath the upper jaw (maxilla).

submaximal below the maximal.

submitochondrial particle any particle derived by disruption of mitochondria. See **H⁺-transporting ATPase, complex I, II, III, IV**.

submolecular describing any chemical or chemical component that exists or functions at a lower level of complexity than that of intact individual molecules. The term may be used in reference to electrons, ions, free radicals, or other molecular fragments. Compare **supramolecular**.

subnatant 1 lying under. 2 a liquid lying under a **supernatant** or under solid material. Compare **infranatant**.

suboptimal below or failing to reach the optimal condition.

subsite a site, e.g. on a protein, that has a specific function within the overall function of a larger site.

substance K see **neurokinin A**.

substance K receptor or **neurokinin A receptor** or **NK-2 receptor** a G-protein-associated membrane receptor that binds substance K and mediates its intracellular effects by activating the **phosphatidylinositol cycle**.

substance P *abbr.*: SP; an 11-residue amide,

found in most tissues of the mammalian body but especially in nervous tissue (both central and peripheral) and in gut tissues. It also occurs in the central nervous system of many other vertebrates. Derived from **protachykinin β precursor**, it is a **tachykinin**; it causes hypotension and vasodilation, and stimulates contraction of the intestine and secretion of saliva. See also **tachykinin receptor**.

substituent group or **substituent** (in *organic-chemical nomenclature*) any atom or **group** (def. 1) that has replaced or can be considered to have replaced (i.e. been substituted for) a hydrogen atom in a parent molecule; for bivalent or trivalent groups there are corresponding replacements of two or three hydrogen atoms.

substitute cysteine accessibility method see **SCAM**.

substituted mechanism a mechanism of an enzyme reaction in which a substrate reacts with the enzyme to produce a modified enzyme and a product. The modified enzyme then reacts with a second substrate to produce a second product and regenerate the enzyme, e.g.

then

where E is the enzyme, E* the modified enzyme, S₁ and S₂ the substrates, and P₁ and P₂ the products.

substitution 1 (*in genetics*) a type of point mutation in which one base pair is replaced by another. In a **transition**, a base is replaced by another of the same chemical class (e.g. a purine by a purine, or pyrimidine by another pyrimidine); in a **transversion**, a base is replaced by one of a different type (e.g. purine by a pyrimidine, or vice versa). **2** (*in sequence analysis*) the replacement of a nucleotide or amino acid residue by another at a given position in an alignment. For protein sequences, if the aligned residues have similar physicochemical properties, the substitution is said to be conservative (e.g. Ile and Leu).

substitution matrix or **amino acid exchange matrix** or **mutation matrix** a symmetrical 20×20 matrix containing values proportional to the probability that amino acid *i* mutates to amino acid *j* for all pairs of amino acids; the diagonal denotes the odds for self-conservation. The most widely used mutation or substitution matrices are the PAM (point accepted mutation) and BLOSUM (Blocks substitution matrix) series. PAM matrices were calculated from aligned sets of closely related sequences, and larger evolutionary distances were extrapolated from the original 1-PAM matrix. BLOSUM matrices were derived from alignments of larger, more diverse sets of sequences. Where the alignments are large enough to be statistically significant, the resulting matrices should reflect the true probabilities of mutations occurring during a particular evolutionary period.

substitution reaction the replacement of a substituent (normally hydrogen), usually at a carbon atom, by any other group.

substrate 1 a substance that is acted upon, especially by an enzyme; a molecule or structure whose transformation is catalysed by an enzyme. **2** or **substratum a** the base upon which an organism grows or lives, e.g. soil or rock. **b** the material upon which a microorganism grows or is placed to grow.

substrate activation the increase of an enzyme's activity by its substrate by an **allosteric** mechanism. *Compare* **substrate inhibition**.

substrate cycle interconversion of reactant and product by two enzymes, one of which (A) catalyses the reaction in one direction while the second enzyme (B) catalyses the reaction in the opposite direction, e.g.

As **flux** (def. 3) (i.e. the rate of reaction catalysed by A minus rate of reaction catalysed by B) through a system varies, the rate of each enzyme reaction may vary independently with concomitant changes in cycling rate. The existence of a substrate cycle increases sensitivity of control, since even if rates of forward and reverse reaction are high, changes in one or both may make relatively larger changes to flux; e.g. if rate of A = 9 and rate of B = 8, then flux = 1; if rate of A doubles to 18 and rate of B remains 8, then flux = 10 (i.e. increases tenfold).

substrate dissociation constant or **substrate constant** symbol *K_s*; the parameter of an enzymatic reaction that is the equilibrium (dissociation) constant for the reaction ES = E + S; i.e. $K_s = [E][S]/[ES]$.

substrate inhibition the inhibition of an enzyme's activity by its substrate by an **allosteric** mechanism. *Compare* **substrate activation**.

substrate-level phosphorylation the formation of ATP (or GTP) in a coupled reaction that is not linked to an electron transport system, e.g. coupled to the deacylation of succinyl coenzyme A or the conversion of 3-phosphoglyceroyl phosphate to 3-phosphoglycerate.

substrate-site hypothesis a hypothesis for the control of insulin release from pancreatic islet B cells by glucose. It postulates that the glucoreceptor is either a carrier transporting glucose into the cell or an enzyme phosphorylating glucose, and the signal for insulin release is a metabolite in the pathway of metabolism of glucose in the B cell. *Compare* **regulator-site hypothesis**.

substratum (*pl. substrata*) **1** any layer (stratum) or structure that lies beneath another, or that forms a base or underlying support for something else. **2** an alternative term for **substrate** (def. 2).

subtiligase any engineered derivative of **subtilisin** that efficiently ligates peptides. The two mutations converting the peptidase, subtilisin, to a ligase involve Ser²²¹ to Cys and Pro²²⁵ to Ala.

subtilin or **subtilin C** an antibiotic produced by *Bacillus subtilis* and active against Gram-positive bacteria, *Neisseria* spp. (*N. catarrhalis*, *N. gonorrhoeae*), and some pathogenic fungi.

subtilisin EC 3.4.21.62; a bacterial **serine endopeptidase** enzyme from *Bacillus subtilis* and other *Bacillus* spp. (e.g. commercially from *B. licheniformis*). It has broad specificity for peptide bonds, with preference for a large uncharged residue at P1 (*see* **peptidase P-sites**) and low activity for glutamyl residues; it hydrolyses peptide amides. The enzyme has similar active-site geometry to the trypsin family but otherwise no homology. *See also* **Nagarse proteinase**.

subtractive cloning a technique for isolating genes expressed in one cell population but not in another. Nucleic acid (typically first-strand cDNA) from which one seeks to isolate differentially expressed genes is hybridized to a large excess of nucleic acid (typically poly(A)⁺ mRNA) from a source that does not express those genes. Only sequences common to the two sources will hybridize and these are removed (typically by chromatography on hydroxyapatite) leaving a pool of nucleic acid enriched in the sequences of interest. This pool can be used to make a cDNA library from which clones of interest may be isolated.

subtractive hybridization a method to identify DNA or RNA that is present in one sample but not in others, and forming the basis of **subtractive cloning**.

subtrahend (*in mathematics*) the number to be subtracted from another number (the minuend).

subunit any polypeptide component within a protein, or other distinct biochemical entity, whether identical to or different from any other components, that is separable from such other components without rupture of covalent bonds. The term is sometimes used in a more restricted sense as referring to any chemically or physically identifiable submolecular entity within a protein, whether identical to, or different from, other components.

subunit-exchange chromatography a form of chromatography in which protein subunits are immobilized on a solid matrix and allowed to interact with protein subunits in solution. Quantification of subunit exchange between the matrix and solution may be used in analysing the association-dissociation properties of the protein system. The method also provides a powerful, specific purification method.

Suc- symbol for **succinyl** (def. 1).

-Suc- or **Suc<** symbol for **succinyl** (def. 2).

succinamic acid a trivial name for 3-carbamoylpropanoic acid, the monoamide of succinic acid.

succinamide a trivial name for butanediamide, the diamide of succinic acid.

succinate 1 a trivial name for butanedioate; ethanedicarboxylate; the dianion of succinic acid. It is an important intermediate in metabolism and a component of the **tricarboxylic-acid cycle**. **2** any mixture of free succinic acid and its mono- and dianions. **3** any salt or ester of succinic acid.

succinate-CoA ligase (GDP-forming) EC 6.2.1.4; *other name*: succinyl-CoA synthetase (GDP-forming); an enzyme of the tricarboxylic-acid cycle that catalyses the formation of succinyl-CoA from GTP, succinate, and CoA with release of GDP and orthophosphate.

succinate dehydrogenase EC 1.3.99.1; *systematic name*: succinate:(acceptor) oxidoreductase; *other names*: fumarate reductase/dehydrogenase. A bacterial enzyme, or a degraded entity from succinate dehydrogenase (ubiquinone), a major component of mitochondrial complex II (*see* **respiratory complex**). It catalyses the oxidation of succinate by an acceptor to form fumarate and a reduced acceptor; it does not react with ubiquinone or free FAD.

succinate dehydrogenase (ubiquinone) EC 1.3.5.1; *systematic name*: succinate:ubiquinone oxidoreductase; *other name*: succinic dehydrogenase. An enzyme that catalyses the oxidation of succinate by ubiquinone to form fumarate and ubiquinol. It is an iron-sulfur flavoprotein (FAD), containing at least four different subunits: a flavoprotein, an iron-sulfur protein, and two hydrophobic anchor proteins, one of which is cytochrome *b*₅₅₆. It is located in the mitochondrial inner membrane, where it is a major component of complex II of the respiratory chain.

succinate-semialdehyde dehydrogenase EC 1.2.1.24; a homo-

succinic dehydrogenase

tetrameric enzyme of mitochondrial matrix that catalyses the reaction:

Succinate semialdehyde can undergo transamination to form γ -aminobutyric acid. However, the transaminase primarily functions to convert γ -aminobutyrate to succinate-semialdehyde, which is then converted to succinate by succinate-semialdehyde dehydrogenase in the catabolism of γ -aminobutyrate. Mutation results in 4-hydroxybutyric aciduria, which is associated with retarded mental, motor, and language development. *See also* **4-aminobutyrate transaminase**.

succinic dehydrogenase *see* **succinate dehydrogenase (ubiquinone)**.

succinimide a trivial name for butanimide; 2,5-pyrrolidinedione; the imide of succinic acid. For structure *see* **imide**.

succinoglycan or **EPS I** an acidic exopolysaccharide produced by *Rhizobium* spp. that is important for invasion of the nodules that the bacteria elicit on their host, *Medicago sativa*. Succinoglycan is a high-molecular-weight polymer composed of repeating octasaccharide subunits. These subunits are synthesized on membrane-bound isoprenoid lipid carriers, beginning with a galactose residue followed by seven glucose residues, and modified by the addition of acetate, succinate, and pyruvate.

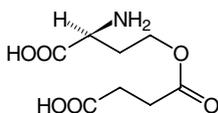

succinyl 1 (*in biochemistry*) symbol: Suc-; the univalent acyl group 3-carboxypropanoyl, HOOC-[CH₂]₂-CO-, derived from succinic acid by loss of one hydroxyl group. **2** (*in chemistry*) symbol: -Suc- or Suc<; the bivalent acyl group butanedioyl, -CO-[CH₂]₂-CO-, derived from succinic acid by loss of both hydroxyl groups.

succinylation the introduction of one or more **succinyl** (def. 1) groups into a substance by acylation, either chemically, e.g. with succinic anhydride, or enzymically, e.g. with succinyl-coenzyme A. It is used to acylate a protein's free lysine (and other) amino groups to change their charge at neutral pH from positive to negative and to render adjacent peptide bonds resistant to hydrolysis by trypsin; it can also cause disaggregation of a multimeric protein. The reaction occurs readily at pH 7–10 (at 0–25 °C), but it is irreversible, unlike the otherwise similar processes of **citraconylation** and **maleylation**, and so is of limited usefulness in protein sequence work.

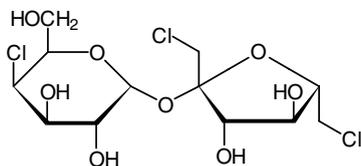

succinylcholine chloride *see* **suxamethonium**.

succinyl-CoA synthetase (GDP-forming) *see* **succinate-CoA ligase (GDP-forming)**.

O-succinylhomoserine an intermediate in methionine biosynthesis in plants and bacteria. It is formed by succinylation (utilizing succinyl-CoA) of homoserine. It reacts with cysteine with loss of succinate to form cystathionine.

sucralose 4,1',6'-trichloro-4,1',6'-trideoxy-galacto-sucrose; a chlorinated sucrose, tasting sweeter than sucrose itself.

sucrase 1 *recommended name*: sucrose α -glucosidase; EC 3.2.1.48; *systematic name*: sucrose α -D-glucosylhydrolase; an α -D-glucosidase-type enzyme from intestinal mucosa that hydrolyses sucrose and maltose. It is also known as **sucrase-isomaltase** by virtue of being an oligo-1,6-glucosidase, EC 3.2.1.10, displayed towards isomaltose. **2** any bacterial or plant enzyme of sub-subclass EC 2.4.1 (hexosyl-

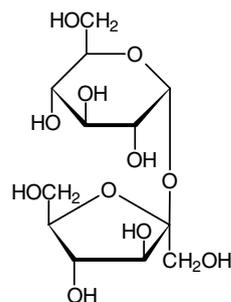

sugar acid

transferases) that synthesizes homopolysaccharides from sucrose by transfer of either its fructose moiety or its glucose moiety respectively to a fructan or to a glucan, with release of the opposing moiety as free D-glucose or D-fructose. The recommended names are formed by adding 'sucrase' to a prefix indicating the polysaccharide product. These enzymes include: (1) **amylosucrase**; EC 2.4.1.4; *other name*: sucrose-glucan glucosyltransferase; *systematic name*: sucrose:1,4- α -D-glucan 4- α -D-glucosyltransferase; it synthesizes amylose; (2) **dextransucrase**; (3) **inulosucrase**; EC 2.4.1.9; *other name*: sucrose 1-fructosyltransferase; *systematic name*: sucrose:2,1- β -D-fructan 1- β -D-fructosyltransferase; it synthesizes inulin; and (4) **levansucrase**; EC 2.4.1.10; *other name*: sucrose 6-fructosyltransferase; *systematic name*: sucrose:2,6- β -D-fructan 6- β -D-fructosyltransferase; it synthesizes levan.

sucrase-isomaltase *see* **oligo-1,6-glucosidase**.

sucrase-isomaltase deficiency *see* **oligo-1,6-glucosidase**.

sucrose or **saccharose** the trivial name for O- β -D-fructofuranosyl-(2 \rightarrow 1)- α -D-glucopyranoside; a sweet-tasting, nonreducing disaccharide. It is usually isolated industrially in crystalline form from sugar cane, *Saccharum officinarum*, or from sugar beet, *Beta vulgaris*.

sucrose gradient a density gradient that consists of different concentrations of sucrose layered in a centrifuge tube. It is used to separate molecules or particles on the basis of their sedimentation coefficients. *See also* **isopycnic centrifugation**.

sucrose-phosphate synthase EC 2.4.1.14; *systematic name*: UDPglucose:D-fructose-6-phosphate 2 α -D-glucosyltransferase; *other names*: UDPglucose-fructose-phosphate glucosyltransferase; sucrose-phosphate-UDP glucosyltransferase. An enzyme that catalyses a reaction between UDPglucose and D-fructose 6-phosphate to form sucrose 6-phosphate and UDP.

sucrose phosphorylase EC 2.4.1.7; *systematic name*: sucrose:orthophosphate α -D-glucosyltransferase; *other name*: sucrose glucosyltransferase. An enzyme that catalyses the phosphorylation of sucrose to D-fructose and α -D-glucose 1-phosphate.

sucrose synthase EC 2.4.1.13; *systematic name*: UDP glucose:D-fructose 2 α -D-glucosyltransferase; *other names*: UDPglucose-fructose glucosyltransferase; sucrose-UDP glucosyltransferase. An enzyme that catalyses a reaction between UDPglucose and D-fructose to form sucrose and UDP.

Sudan a family of dyes that are soluble in organic solvents and are used for staining lipids. **Sudan Red** is the 2,2'-demethyl analogue of **Oil Red O**. **Sudan Black B** is used for staining chromosomes, Golgi apparatus, and leukocyte granules.

suffix tree a data structure that allows rapid solution of problems involving character strings (sequences) and facilitates substring searches. The tree is built by removing the first character of a string, storing the resulting suffix, removing the first character of the result, storing this, and so on, until the result is a single character.

sugar any, usually sweet, soluble disaccharide or small oligosaccharide carbohydrate. More specifically it is applied to **sucrose**, the sugar of commerce. The name is sometimes used as a synonym for **carbohydrate**. *See also* **beet sugar**, **blood sugar**, **cane sugar**, **corn sugar**, **fruit sugar**, **grape sugar**, **malt sugar**, **milk sugar**, **mushroom sugar**, **reducing sugar**.

sugar acid any **aldaric acid**, **aldonic acid**, or **uronic acid**.

sugar alcohol *an old name for alditol.*

sugar beet the plant *Beta vulgaris*, which has a large root with a high sugar content, for which it is extensively cultivated.

sugar transporter any of various families of transmembrane proteins responsible for sugar transport into cells. **GTR1** causes facilitated diffusion of glucose, whereas **XylE** protein in *Escherichia coli* acts as an H⁺-xylose symporter (*see xylE*). Both belong to the 12-transmembrane domain superfamily. *See glucose transporter, PTS.*

suicide enzyme *see suicide repair (of DNA).*

suicide inhibitor a type of enzyme inhibitor that is relatively unreactive and becomes reactive only after interaction with the enzyme's active site. *See also photosuicide inhibitor.*

suicide repair (of DNA) a response in bacterial and mammalian cells to exposure to a nontoxic alkylation dose. Such exposure causes the rapid induction of enzymes that remove the **O⁶-methylguanine** formed by the alkylating agent. In this process the methyl group is transferred to the enzyme, which is thereby inactivated (i.e. it is a **suicide enzyme**).

suicide substrate 1 a substrate that causes an enzyme to be modified in a way that permanently inactivates it. **2** a compound that is converted by a metabolic pathway into an inhibitor of the pathway, as with the conversion of fluoroacetate to fluorocitrate. If the pathway is of sufficient importance, the cell thereby 'commits suicide'. *See also lethal synthesis.*

sulfa drug any **sulfonamide** compound that is clinically useful in the treatment of bacterial infections.

sulfamethoxazole 4-amino-*N*-(5-methyl-3-isoxalyl)benzenesulfonamide; a **sulfonamide** antibacterial agent. As a mixture with **trimethoprim** it has the name **co-trimoxazole** (*proprietary names*: Bactrim; Septrim).

sulfane a chain of divalent sulfur atoms, as in hydrogen per-sulfide (HSSH) or polysulfanes (H₂S_{*n*}; e.g. H₂S₅ is pentasulfane).

sulfanilamide *p*-aminobenzenesulfonamide; *see sulfonamide*.

sulfatase *see arylsulfatase.*

sulfate or (*esp. Brit.*) **sulphate** the anion SO₄²⁻.

sulfate adenyltransferase EC 2.7.7.4; *other names*: sulfate adenylate transferase; ATP-sulfurylase; sulfurylase; an enzyme that catalyses the formation of **adenosine 5'-phosphosulfate** (adenylsulfate) from ATP and sulfate with release of pyrophosphate.

sulfatide a **galactosyl cerebroside** with a sulfate radical esterified at the 3' position of the galactose moiety. Sulfatides are formed by **galactosylceramide sulfotransferase**.

sulfatide lipidosis *an alternative name for metachromatic leukodystrophy.*

sulfation factor *an alternative name for somatomedin.*

sulfenic acid a compound having the structure RSOH (e.g. cysteine sulfenic acid), in which the sulfur is oxidized by addition of one oxygen atom. *Compare sulfonic acid.*

sulfhemoglobin any of a group of poorly characterized derivatives of **hemoglobin**, often formed *in vivo* together with ferrihemoglobin. They are incapable of carrying oxygen and cannot be converted back to hemoglobin.

sulfhydryl or **thiol** the chemical group -SH; it is found in the amino acid **cysteine** and in other molecules. Two sulfhydryls can be oxidized to a disulfide bond, -S-S-.

sulfinic acid a compound having the structure RS(=O)OH (e.g. cysteine sulfinic acid), in which the sulfur is oxidized by addition of two oxygen atoms. *Compare sulfenic acid.*

sulfite or (*esp. Brit.*) **sulphite** the anion SO₃²⁻.

sulfite oxidase EC 1.8.2.1; the terminal enzyme in the degradation of sulfur-containing amino acids in animals. It catalyses the oxidation of sulfite to sulfate and is present in the mitochondrial intermembrane space in many tissues but not in blood or skeletal muscle. The crystal structure of the chicken-liver enzyme contains a domain for binding heme, another for molybdenum cofactor, and a third for dimerization. *See sulfite oxidase deficiency.*

sulfite oxidase deficiency a severe, frequently fatal, autosomal recessive human disease that presents with convulsions early after birth, encephalopathy, and accumulation and increased excretion of sulfite, thiosulfate, and *S*-sulfoysteine. It produces neuronal cell loss and demyelination, and results from various mutations that inactivate **sulfite oxidase**.

sulfite reductase *abbr.* SiR. **1 sulfite reductase** (NADPH) EC 1.8.1.2; *systematic name*: hydrogen sulfide:NADPH⁺ oxidoreductase; the enzyme responsible for interconversion of hydrogen sulfide and sulfite in plants and most bacteria. It catalyses the reduction of sulfite, e.g. released from **3'-phosphoadenosine 5'-phosphosulfate** by thioredoxin. The reaction is:

cofactors are FAD, FMN, and siroheme. In plants and most microorganisms the H₂S reacts with *O*-acetylserine to form cysteine and acetate. The enzyme also oxidizes H₂S to sulfite. **2 sulfite reductase** An enzyme, EC 1.8.7.1; *systematic name*: hydrogen-sulfide:ferredoxin oxidoreductase. In plants it is a siroheme-containing iron-sulfur protein that catalyses the reaction:

sulfmethemoglobin the complex formed by combination of sulfide with the ferric ion of **ferrihemoglobin** in poisoning by sulfide.

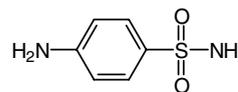

sulf(o)+ or (*esp. Brit.*) **sulph(o)+** of, or pertaining to, or containing a sulfur atom or group.

sulfoindocyanine or (*esp. Brit.*) **sulphoindocyanine** a fluorescent dye, such as **Cy3** and **Cy5**, used in labelling proteins and DNA.

sulfokinase or **aryl sulfotransferase** or **phenol sulfotransferase** EC 2.8.2.1; an enzyme that catalyses transfer of a sulfate radical from 3'-phosphoadenylylsulfate to a phenol to form an aryl sulfate.

sulfolipid any lipid containing sulfur, especially a **sulfatide**. *See also sulfonolipid.*

sulfonamide 1 the amide of a sulfonic acid; the sulfonamide group is -SO₂-NH₂. **2** (*in biology and medicine*) or **sulfa drug** any of a group of antibacterial substances derived from **sulfanilamide** (*p*-aminobenzenesulfonamide), many of which have a substituent on the amide nitrogen.

sulfanilamide

sulfonate an anion of a sulfonic acid, having the structure RS(=O)(O)⁻², in which the sulfur is oxidized by addition of one oxygen atom.

sulfone the oxidation product that results when one oxygen atom is added to sulfur bonded to two alkyl chains.

sulfonolipid or **plant sulfolipid** 1,2-diacyl-3-(6-sulfo- α -D-quinovosyl)-sn-glycerol; sulfoquinovosyldiacylglycerol (*abbr.*: SQDG); the only sulfolipid present in higher plants and the only known lipid with a sulfonic-acid linkage; the predominant fatty acid is α -linolenic acid. Sulfonolipid is localized in the chloroplasts, mainly in the membrane of the thylakoids.

sulfonylurea any oral hypoglycemic drug that contains a sulfonic acid-urea nucleus modified by chemical substitution. The group includes tolbutamide, chlorpropamide, gliburide, and glipizide. A sulfonylurea receptor is the regulatory subunit for the ATP-dependent K⁺ channel (**KATP**) of the pancreatic B-cell plasma membrane. The drugs also bind intracellular proteins on membranes of secretory granules of these cells, which may mediate part of their effect.

sulfonylurea receptor 1 *abbr.*: SUR-1; an integral membrane protein of pancreatic B cells that binds sulfonylurea drugs with high affinity and regulates the function of ATP-sensitive K channel (*also called* K_{ATP}). It binds ATP and ADP, belongs to the ABC transporter family, and in hamster contains 1582 amino acids. Several mutations in SUR-1 have been associated with persistent hyperinsulinemic hypoglycemia of infancy (PHHI).

sulfoxide the oxidation product that results when two oxygen atoms are added to sulfur bonded to two alkyl chains.

sulfur or (*esp. Brit.*) **sulphur** *symbol*: S; a yellow nonmetallic element of group 16 of the IUPAC **periodic table**; atomic number 16; relative atomic mass 32.066. Its main oxidation states are -2, +4, and +6.

Sulfur exists in a number of forms including crystalline (rhombohedral, monoclinic, rhombohedral) and amorphous forms. The relative abundance of stable isotopes is: sulfur-32 (mass 31.972) 95.02%; sulfur-33 (mass 32.971) 0.75%; sulfur-34 (mass 33.968) 4.21%. There are two radioactive isotopes, **sulfur-35** and **sulfur-38**. Sulfur is important as a constituent of the amino acids methionine and cysteine, and as a constituent of **glutathione**. It also occurs in **sulfolipids**. Sulfate is the terminal electron acceptor for anaerobic respiratory metabolism in certain bacteria e.g. *Desulfovibrio* spp.

sulfur-35 the radioactive nuclide, ${}^{35}_{16}\text{S}$, with a mass of 34.969. It emits an electron (β^- particle, 0.167 MeV), no gamma radiation, and has a half-life of 87.4 days.

sulfur-38 the radioactive nuclide, ${}^{38}_{16}\text{S}$, with a mass of 37.971. It emits an electron (β^- particle, 3.0 MeV) and gamma radiation (1.94 MeV), and has a half-life of 2.87 h.

sulfurylase *see* **sulfate adenyltransferase**.

sulph(o)+ *a variant spelling (esp. Brit.) of sulf(o)+.*

sum 1 the total value of a set of individual values. **2** to determine a sum.

sumatriptan 3-[(2-dimethylamino)ethyl]-*N*-methyl-1*H*-indole-5-methanesulfonamide; an agonist for 5-HT_{1D} receptors (*see* **5-hydroxytryptamine receptor**). It constricts cerebral blood vessels, and is used in the treatment of migraine and cluster headaches. *Proprietary name:* Imigran (succinate).

summation the determination of the **sum** (def. 1) of a series.

SUMO *abbr. for* small ubiquitin-related modifier; *other name:* *sen-trin*; a ubiquitin-like protein that becomes conjugated by an isopeptide bond with several proteins (e.g. RanGAP1, PML, I κ B in mammals). Human SUMO (101 amino acids) shares 18% sequence identity with ubiquitin, and a globular fold consisting of beta sheets wrapped around an alpha helix. Conjugation (**sumoylation**) is between Gly-97 (uncovered by removal of the C-terminal tetrapeptide by a SUMO-specific protease) and the side chain of a lysine in the target protein. It occurs predominantly in the nucleus and regulates nuclear transport, signal transduction, the stress response, and cell-cycle progression; it does not involve proteasomes. Deconjugation (**desumoylation**) is catalysed by SUMO-specific proteases.

sumoylation *see* **SUMO**.

SUMT *abbr. for* *S*-adenosyl-L-methionine:uroporphyrin-III C-methyltransferase (*see* **uroporphyrin-III C-methyltransferase**).

Sunday driver a mutation in *Drosophila* that mixes up intracellular traffic.

super+ *prefix* **1** above, over, at the top (of). **2** of greater size or extent, or of higher quality. **3** beyond the usual or normal standard; exceeding. **4** (*in chemical nomenclature*) designating a compound that contains more than the usual proportion of a specified element. *Compare* **sub+**, **supra+**.

superantigen an antigen with the ability to activate a large proportion (up to 20%) of T lymphocytes in a given individual through interaction with the variable domain of the β chain of the lymphocyte's antigen receptor. This contrasts with conventional foreign antigens the peptides of which, attached to the major histocompatibility complex (MHC), have to be specifically recognized by the T-cell receptor. With superantigens the specificity resides in the β chain of the receptor not the MHC peptides. This accounts for the fact that many more than usual T lymphocytes are activated. Superantigens are present in a number of bacteria and viruses; the best example is the *Staphylococcus* enterotoxin. Superantigens have been implicated in **autoimmunity**.

supercoil or **superhelix** or **coiled coil** the form of DNA that can be envisaged as resulting if a **duplex** were turned through a hairpin bend and the two duplex rails twisted one around the other. DNA *in vivo* generally is supercoiled, and as it has a closed structure, a supercoil may be envisaged as a rubber band twisted to a helical shape. In **negative supercoiling** the DNA twists around its axis in the opposite direction from the clockwise turns of the right-handed double helix; this allows relief of torsional pressure, and the DNA is said to be **underwound**. Twisting in the other direction (**positive supercoiling**) increases torsional pressure, winding the double helix more highly; the DNA is said to be **overwound**. **Superhelix density**, σ , is defined as the number of turns of the superhelix, τ , per turn of the duplex, β ; i.e. $\sigma = \tau/\beta$ (β represents about 10 base pairs). **Linking**

number is the number of times the duplex strands cross over each other (in projection onto a plane surface). The number of superhelical turns is called the **writhing number** (**W**).

supercritical fluid chromatography a technique that can be regarded as an extension of **gas-liquid (partition) chromatography** in which the mobile phase is a relatively dense gas such as CO₂ (or SF₆, NH₃, or Xe). The gas must be pumped (at pressures up to 6000 psi) through a capillary column that is coated with stationary phases similar to those used in gas chromatography. The system depends on the partition of the compounds being separated between the stationary and mobile phases and has the advantage that compounds with high boiling points partition appreciably into the gas phase at temperatures well below their boiling points so that such compounds can be separated at lower temperatures than with less dense gases.

superfamily any group of genes and their cognate proteins that are related usually by sequence homology.

superfold 1 a common fold found in nonhomologous proteins (e.g. TIM barrels). **2** (*sometimes*) *an alternative term for super-secondary structure*.

superfolding (*of proteins*) the formation of small domains, beyond the level of simple secondary structures, that are energetically stable and contribute as units to the full tertiary structure of a protein. They may consist of **alpha helices** or **beta sheets** or both. They may be formed during the early stages of protein folding, before the protein has fully folded. For example, **beta barrels** are **super-folds**.

superfusion 1 the pouring of a liquid onto or over something. **2** (*in physiology and medicine*) a technique in which blood, plasma, or other fluid is allowed to drip onto, or flow over, the surface of an organ or piece of tissue.

supergene a group of linked genes (*see* **linkage** (def. 1)) that are usually inherited as a unit.

superhelix *an alternative name for supercoil*.

superhelix density *see* **supercoil**.

superinfection the proliferation of one or more pathogenic microorganisms arising from the disturbance of a mixed population of microorganisms normally sustained at non-pathogenic levels by secretion of endogenous antibiotics. Such disturbance can be induced by administration of exogenous antibiotic agents.

superinfection inhibition interference with the entry or establishment of an entering plasmid by a resident plasmid.

supernatant 1 floating on the surface of a liquid or lying over something. **2** (*or* **supernate**) **a** liquid lying above another liquid, a sediment, or a settled precipitate. **b** the fluid phase that remains after removal of solid material by centrifugation. A **cell supernatant** is the fluid phase that remains after centrifugation of a cell homogenate at high speed (characteristically at 100 000 *g* for 30 min). *Compare* **infranatant**.

supernate *an alternative name for supernatant* (def. 2).

superoxide 1 the anion, O₂⁻, formed by addition of one electron to **dioxygen**. **2** any compound containing the superoxide anion.

superoxide dismutase *abbr.:* SOD; EC 1.15.1.1; *systematic name:* superoxide:superoxide oxidoreductase; *other names:* cytocuprein; erythrocuprein; hemocuprein. Any of a group of metal-containing enzymes that bring about the **dismutation** of superoxide radicals to form dioxygen and hydrogen peroxide as follows:

It is important in removing the highly toxic superoxide radical. Some (e.g. those from *Neurospora*, yeast, erythrocytes, heart, peas) contain copper and zinc; others (e.g. those from *Escherichia coli*, *Streptomyces mutans*) contain manganese or iron. Eukaryotic cells have copper-zinc types in cytoplasm and manganese types in mitochondria. The copper-zinc types comprise a well-conserved family with four motifs.

Superscript *proprietary name for* a reverse transcriptase derived from Moloney murine leukemia virus (MMLV) and modified by protein engineering to have reduced RNase H activity.

super-secondary structure or (*sometimes*) **superfold** the arrangement of protein secondary structures into discrete folded units – e.g. beta barrels, β - α - β units, and Greek keys. *Compare* **superfold** (def. 1).

supported reagent any reagent linked to a **support medium**.

support medium any (usually solid or insoluble) medium to which a cell, reagent, or functional group can be attached.

suppression 1 (*in molecular biology*) the cancellation, or reversal of the effects, of one mutation by another mutation, except where the second mutation causes a single base change at the same point as an earlier **point mutation** (in which case the term **reversion** is used). In **intergenic suppression**, the effects of a mutation in one gene are reversed by a mutation in another gene, usually because the second gene codes for a mutant tRNA (*see frameshift suppressor*). In **intra-genic suppression** a mutation is cancelled by a second mutation close to the first in the same gene, normally within the same triplet, giving rise to a codon that is compatible with translation to a functional protein product. As an example, if the first mutation changed AGT (leading to the RNA codon for Ser) to ATT (giving a non-sense codon), a suppressor mutation might change the triplet to ATA (giving the RNA codon for Tyr); if the change Ser to Tyr led to a functional protein, suppression would be achieved. *See also amber suppressor, ochre suppressor, opal suppressor.* **2** (*in immunology*) any attenuation of an immune response. The existence of a subpopulation of T cells, **suppressor cells**, is held to be responsible for attenuation of the effect of **helper cells**. A different mechanism is probably responsible for the reduction in antibody production arising from injection of antibody prior to administration of antigen. Allotype suppression refers to suppression of the production of one allotype (e.g. expression of the allotype inherited from the mother, and suppression of the allotype of the father).

suppressor cell or **suppressor T cell** or **T-suppressor cell** any T lymphocyte that inhibits (*see suppression* (def. 2)) the stimulation of the immune response by **helper cells**. Classically, suppressor cells belong to the **CD8⁺** subset in the human. Induction of the suppressor function may derive from helper cells.

suppressor gene a gene that can reverse the effect of a specific type of mutation in another gene. *See suppression* (def. 1).

suppressor mutation a secondary mutation that totally or partially restores a function lost due to a primary mutation at another locus. *See suppression* (def. 1).

suppressor tRNA any species of **transfer RNA** (tRNA) that recognizes a **termination codon** in messenger RNA. It adds an amino-acid residue to what is normally the C terminus of a nascent polypeptide chain; hence termination of synthesis of the peptide is suppressed and a **readthrough** protein is consequently formed. Suppressor tRNA may occur naturally or be produced by mutagenesis.

supra+ *prefix* above, over, greater than. *Compare infra+, super+.*

supramolecular describing any chemical system or component thereof that exists and functions at a higher level of complexity than intact individual molecules. In biochemistry the term may refer to multienzymes, microtubules, organelles, biological membranes, viral envelopes, cell walls, ribosomes, or other cellular elements; hence, e.g., supramolecular assembly, supramolecular complex, supramolecular structure. *Compare submolecular.*

suprarenal gland an obsolete term for **adrenal gland**.

suprarenin a former name for adrenaline (i.e. **epinephrine**).

Sur *symbol* for a residue of the thiopyrimidine base **thiouracil**.

SURE *abbr. for* Stop Unwanted Rearrangement Events; a proprietary strain of *E. coli* developed to allow cloning of DNA sequences that cannot be cloned in other *E. coli* strains.

SURF1 *abbr. for* surfet gene 1 product; one of the proteins encoded by a cluster of six housekeeping genes (locus at 9q34). It is targeted to the inner mitochondrial membrane, contains 300 amino acids and two transmembrane segments, and is required for normal activity of complex IV of the respiratory chain in humans. Mutations affect mostly the brain and produce **Leigh syndrome**.

surface-active agent an alternative term for **surfactant**.

surface concentration *see concentration* (def. 1).

surface plasmon resonance a phenomenon that occurs when light is reflected off thin metal films, which may be used to measure interaction of biomolecules on the surface. An electron charge density wave arises at the surface of the film when light is reflected at the film under specific conditions. A fraction of the light energy incident at a defined angle can interact with the delocalized electrons in the metal film (plasmon) thus reducing the reflected light inten-

sity. The angle of incidence at which this occurs is influenced by the refractive index close to the *backside* of the metal film, to which target molecules are immobilized. If ligands in a mobile phase running along a flow cell bind to the surface molecules, the local refractive index changes, leading to a change in SPR angle which is proportional to the mass being immobilised. This can be monitored in real time by detecting changes in the intensity of the reflected light, producing a *sensorgram*.

surface-stress theory a theory that relates mechanical stress to enlargement of the bacterial cell wall during growth. The cell wall withstands stress from hydrostatic pressure by a stress-bearing, two-dimensionally linked peptidoglycan sacculus that surrounds the cell. During enlargement, enzymes that enlarge the wall must at the same time maintain the hydrostatic integrity of the cell by withstanding stress.

surface tension *symbol:* Y or σ or γ ; the property that makes a liquid behave as if it had an elastic skin on its surface – at an interface with a gas or an immiscible liquid – as a result of intermolecular forces tending to pull the molecules in the surface into the interior of the liquid. It is defined as the force acting tangential to the surface on one side of a line of unit length in the surface, and is expressed in newtons per metre. It can also be defined as the work required to produce unit increase in surface area, expressed in joules per square metre.

surfactant or **surface-active agent** any substance, such as a **detergent** or an **emulsifier**, that can bring about a reduction of the **surface tension** of a liquid, allowing it to foam, to penetrate porous solids more easily, and to wet surfaces of nonporous solids or of immiscible liquids.

surfactant protein *abbr.:* SP; any of four proteins secreted by type II cells of alveoli and bronchial mucosa as constituents of **pulmonary surfactant**. SP-A and SP-D are **collectins**, having similar structures and serving mostly in defence against microorganisms. SP-B and SP-C are structurally unrelated and help stabilize the phospholipids of the secretion. SP-B is an amphipathic 79-residue polypeptide. SP-C is a hydrophobic 33–34-residue polypeptide. All are derived from larger precursors. Many mutations in the gene at 2p12-p11.2 for SP-B, and more rarely in the genes for the other proteins, are associated with respiratory distress syndrome of infants (especially in those born prematurely), and also in adults.

surfactin a surface-active antibiotic and nonimmunogenic hemolysin secreted by *Bacillus subtilis*. It consists of a nonapeptide (containing two residues each of L- and D-leucine) in cyclic depsipeptide linkage with β -hydroxy- ω -methylmyristic acid. It is classified in the TC system under the number 1.C.12.

surfeit gene *see SURF1*.

surrogate genetics a branch of molecular genetics in which DNA is modified *in vitro* and then reintroduced into a genetic system – the 'surrogate' system – e.g. by injection into *Xenopus* oocytes, by transfection of cells, or by the creation of transgenic animals. The effect of the modification on the expression of the gene provides insights into the role in the genetic system of particular base sequences.

surveyor substrate one of a system of fluorescent substrates designed to measure distances within the active centre of an enzyme and also to survey other aspects of the topography of the active centre during the catalytic event.

survivin a member of the Inhibitor of Apoptosis gene family implicated in regulation of cell division and suppression of apoptosis. It is over-expressed in human cancers, being concentrated in mitotic spindle. In normal tissue, survivin is expressed only during the development of the embryo and fetus, where it is believed to play a role in controlling apoptosis.

Sushi domain or **complement control protein module** or **short consensus repeat** a polypeptide domain of ~60 amino acids that contains disulfide bonds between the first and third, and second and fourth cysteines, as found in β_2 glycoprotein-1 of plasma, in complement proteins, and in **blood coagulation factor XIII**.

suspension culture the culture of cells in medium without adherence to a stationary substrate. Relatively few animal cell types are amenable to suspension culture (classically **HeLa cells** can be so grown). An intermediate situation utilizes beads to which the cells

adhere; the beads can be maintained in suspension and collected by sedimentation

Su(var) *abbr.* for suppress variegation; any of a group of genes in *Drosophila* and yeast that suppress euchromatin/heterochromatin variegation in the higher structure of chromatin. Among them are genes for many enzymes that modify residues in the N-terminal regions of core histones of nucleosomes. Their action leads to gene silencing and assembly of heterochromatin. Su(var) genes are opposed by the products of **E(var)** genes. Some human homologues encode histone methyltransferases that selectively methylate histone H3 at lysine residue 9.

suxamethonium succinylcholine chloride, 2,2'-(1,4-dioxo-1,4-butanediyl)bis(oxy)bis[*N,N,N*-trimethylethanaminium] dichloride; a nicotinic receptor ligand that causes sustained activation of the receptors leading to blockade of synaptic transmission ('depolarizing block'). It is used as a neuromuscular blocking agent in surgery. It acts by mimicking acetylcholine at the neuromuscular junction, but disengagement from the receptor site and subsequent breakdown are slower than for acetylcholine. It is hydrolysed by serum cholinesterase and recovery is spontaneous. **Decamethonium** was the first drug of this type to be developed. Both of these compounds depend for their action on the N^+-N^+ distance of 1.1 nm. *Compare* **curare**, **tubocurarine**.

Sv *symbol* for 1 sievert. **2** svedberg (alternative to S).

SV40 *abbr.* for simian virus 40.

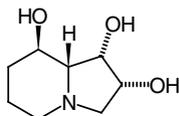

svedberg or **Svedberg unit** *symbol:* S or Sv; a coherent non-SI unit used as a measure of **sedimentation coefficient**; 1 S = 10^{-13} s.

Svedberg centrifuge a centrifuge, designed and built by Swedish colloid chemist Theodor Svedberg (1884–1971) in 1923, that was the forerunner of the **ultracentrifuge**.

Svedberg equation an equation relating the relative molecular mass, M_r , of a solute to its sedimentation velocity in an applied centrifugal field. If s is the sedimentation coefficient, D is the diffusion coefficient, \bar{v} is the partial specific volume of the solute, ρ is the density of the solution, R is the gas constant, and T is the thermodynamic temperature, then

$$M_r = sRT/D(1 - \bar{v}\rho).$$

swainsonine $8\alpha, \beta$ -indolizidine- $1\alpha, 2\alpha, 8\beta$ -triol; an inhibitor of a number of α -mannosidases, particularly Golgi mannosidase II (*see* **Golgi mannosidase**), an important enzyme in the synthesis of the core oligosaccharide of a number of membrane glycoproteins. It inhibits the growth of tumours and prevents metastases in mice. [After its source, *Swainsona canescens*].

swaposin a feature of some proteins in which domains, characteristically found in one protein, are found arranged in a different order in other proteins. The phenomenon was first commented on in relation to certain plant aspartic peptidases, which contain saposin-like domains swapped into a different order from that found in **saposins** (hence the name). In another example, some **pleckstrin homology domains** are found to be interrupted by inserts of **SH domains**.

sweetener any compound intended as a substitute for sucrose in sweetening food or drink, and aimed at avoiding the possible harmful effects of sucrose. Such compounds therefore should be non-nutritive and nonharmful but with a taste and aftertaste similar to those of sucrose. They include **aspartame**, **lactitol**, **mannitol**, **monellin**, **saccharin**, **stevioside**, **sucralose**, and **volemitol**. Sodium cyclamate was used as a sweetener until it was banned in the USA in 1970 because of its carcinogenicity.

sweetness one modality of the sense of taste, characterized by the effect of certain sugars such as sucrose and fructose.

SWI *abbr.* for mating-type switching gene; a gene of yeast that is re-

quired for transcriptional regulation of an endonuclease involved in mating-type switching. *See* **SWI/SNF**.

swinging-bucket rotor a type of centrifuge head in which the centrifuge tubes are placed in buckets that swivel on trunnions so that at speed the tube is oriented with its axis parallel to the centrifugal force (i.e. horizontal). Such a head is essential for zonal centrifugation through density gradients as angled tubes induce mixing. *Compare* **angle head**.

SWI/SNF *abbr.* for switching/sucrose nonfermenting; a protein complex (≈ 2.0 MDa) that contains ≈ 11 polypeptides and is present in all eukaryotic cells. It causes ATP-dependent nucleosome remodelling and stimulates binding of transcription factors to DNA. It was first characterized in yeast as essential for expression of genes for mating type switching and for sucrose. Inositol tetrakisphosphate stimulates its action. *See* **NURF**.

Swiss-Prot *see* **sequence database**.

switch 1 (*of a gene*) to activate (switch on) or inactivate (switch off) transcription. **2** (*of a protein*) to change from an active to an inactive form by changing conformation, e.g. as a result of binding to a specific ligand or of chemical modification. **3** (*in development*) to transfer from synthesis of a protein appropriate for a fetus to that appropriate for postnatal life. **4** (*in immunity*) to change synthesis of one class of immunoglobulins to that of another. *See* **molecular switch**.

switch peptide the flexible covalent connection between the **variable region** and **constant region** of an immunoglobulin molecule.

switch recombinase *see* **homothallic switching endonuclease**.

swivelase *see* **DNA swivelase**.

SWRP *abbr.* for systemic wound response protein; a group of defence proteins in plants whose synthesis is induced by the peptide hormone **systemin** in response to wounds inflicted mechanically or by herbivorous insects. At the target tissue systemin activates a signalling cascade that produces jasmonic acid, which is the inducer of the SWRP genes.

Sxl *symbol* for **sex lethal** gene of *Drosophila*.

SYBR Gold a proprietary cyanine dye used for fluorescent staining of nucleic acids with great sensitivity.

SYBR Green a proprietary name for one of two asymmetrical cyanine dyes whose fluorescence is greatly increased by binding to DNA. Sybr Green I is used for the measurement of low concentrations of DNA and in monitoring DNA amplification in real-time polymerase chain reaction.

Syk *abbr.* for spleen tyrosine kinase; a protein tyrosine kinase that phosphorylates the adaptor protein SLP-76. It and SLP-76 are involved in platelet degranulation, secretion of interleukin 2, and generation of lymphatic vessels. Mice with mutations in Syk or SLP-76 develop arteriovenous malformations.

sym+ a variant form of **sym+** (before b, m, or p).

sym- prefix (*in chemical nomenclature*) denoting symmetric; e.g. *sym*-trinitrobenzene.

symbiont an organism that lives as a partner in a **symbiosis**.

symbiosis (*pl.* **symbioses**) a long-term association between individuals belonging to two different species. The term is often used in a restricted sense to denote associations that are beneficial to one or both partners, although strictly it refers equally to neutral or harmful associations. —**symbiotic adj.**

symbiosome a vacuole within root cells of nitrogen-fixing plants that forms on infection by *Rhizobium* species and engulfs one or more bacteria, which become transformed to bacteroids. The delimiting membrane (peribacteroid membrane) acquires newly synthesized proteins (nodulins), which form membrane channels, transport proteins, enzymes of carbon and nitrogen metabolism, or leghemoglobin.

symmetry precise correspondence between two halves with respect to both size and shape. A molecule has an n -fold **axis of symmetry** if rotation around this axis through an angle of $360^\circ/n$ produces an arrangement indistinguishable from the original (n being a small integer). For example, water has a twofold ($n=2$) axis of symmetry. A plane of symmetry is a plane drawn through a molecule such that a mirror placed in this plane forms an image of one half of the molecule that is superimposable on the other half. For example, a plane of symmetry is present in *meso*-tartaric acid. An alternating axis of

symmetry or rotation–reflection axis is an axis such as is present in a molecule when rotation around the axis through an angle of $360^\circ/n$ followed by reflection in a plane perpendicular to the axis produces a molecule superimposable on the original molecule. For example, a compound with such a twofold ($n=2$) axis is fumaric acid. A centre of symmetry is a position (point) such that if a straight line is drawn from every atom to the point, and is continued beyond the point, an equivalent atom is found at a distance equal to that between the point and the original atom. A molecule with such a centre has a twofold alternating axis of symmetry. An example of a molecule with a centre of symmetry is fumaric acid.

sympathectomy the surgical section of sympathetic nerve fibres.

sympathetic nervous system one of the two divisions of the **autonomic nervous system** the other being the parasympathetic nervous system. Most, but not all, sympathetic nerves release **norepinephrine** as a neurotransmitter.

sympatheticomimetic *an alternative term for sympathomimetic.*

sympathomimetic or **sympatheticomimetic** 1 describing a substance or action that stimulates the **sympathetic nervous system**; **adrenergic**. 2 a sympathomimetic agent, especially a sympathomimetic amine.

symport or *sometimes* **cotransport** a transport process in which two substances (usually a cation and an uncharged molecule) move across the membrane on a specific transporter, the process representing a downhill movement of one of them (the cation) and an uphill movement of the other (the uncharged molecule). In some cases, a cation and an anion are transported together when no external source of energy is required. The proteins involved may be designated as **symporters**.

syn- *abbr. for* **synclinal** (def. 1); *see also* **conformation**.

syn+ *comb. form* signifying similarity, association, or concerted action.

Synacthen *see* **tetracosactide**.

synaeresis *a variant spelling of* **syneresis**.

synapse or (*rare*) **synapsis** the junction between a nerve fibre of one neuron and another neuron; the site of interneuronal communication. As the nerve fibre approaches the synapse it enlarges into a specialized structure, the **presynaptic nerve ending**, which contains mitochondria and **synaptic vesicles**. At the tip of the nerve ending is the **presynaptic membrane**; facing it, and separated from it by a minute cleft – the **synaptic cleft** – is the **postsynaptic membrane** of the receiving neuron. On arrival of nerve impulses, the presynaptic nerve ending secretes **neurotransmitters** into the synaptic cleft. These diffuse across the cleft and transmit the signal to the postsynaptic membrane. *See also* **neuromuscular junction**. —**synaptic** *adj.*

synapsin I a major neuron-specific protein present in virtually all synaptic vesicles. Phosphorylated at multiple sites by Ca^{2+} -calmodulin-dependent and cyclic AMP-dependent protein kinases, it coats synaptic vesicles, and binds to the cytoskeleton. Synapsin IB is derived by alternative splicing; synapsins II are related.

synapsis 1 the pairing of chromosomes during **meiosis**. 2 *a less common word for* **synapse**.

synaptic cell adhesion molecule *see* **SynCAM**.

synaptic cleft the extracellular space, typically some 20 nm across, that separates the presynaptic nerve ending from the postsynaptic membrane of the receiving neuron (or other target cell) in a **synapse**. Chemical mediation of nerve transmission occurs across the synaptic cleft.

synaptic vesicle a vesicle, 20–65 nm in diameter, occurring within the cytoplasm of the presynaptic nerve ending and often closely related to the presynaptic membrane (*see* **synapse**). Synaptic vesicles store **neurotransmitters** and release them by fusing with the presynaptic membrane.

synaptic vesicle-associated membrane protein *another name for* **synaptobrevin**.

synaptobrevin or **sinaptobrevin** or **synaptic vesicle-associated membrane protein** (*abbr.*: VAMP) a SNAP receptor and member of the physin family involved in the docking and fusion complex (*see* **SNARE**) of synaptic vesicles and playing a central role in neural exocytosis. Synaptobrevin isoforms 1 and 2 (VAMP-1 and VAMP-2) are known. Both are expressed in all the main rat tissues, but differential expression is found, e.g. VAMP-1 is restricted to exocrine

pancreas and kidney tubular cells, VAMP-2 predominates in islets of Langerhans and kidney glomerular cells.

synaptogyrin any of a family of membrane proteins (29 kDa) of synaptic vesicles of neurons and neuroendocrine cells. It contains four transmembrane segments, localizes (and shares some sequence homology) with synaptophysin, and like it is phosphorylated on tyrosine residues. *See also* **gyrin**.

synaptojanin a protein, found in nerve terminals in brain, that has inositol 5-phosphatase activity, and binds to the SH3 domain of **amphiphysin**, colocalizing with that protein in double immunofluorescence micrographs. It appears to participate with **dynamin** in synaptic vesicle recycling. It shares similarity with the yeast protein Sac1, which is genetically implicated in phospholipid metabolism and the function of the actin cytoskeleton.

synaptonemal complex an elaborate structure that holds paired chromosomes together during synapsis in prophase I of meiosis and promotes genetic recombination. It consists of a ladder-like protein core (comprising central elements joined to lateral elements by transverse filaments) with corresponding regions of the two sister chromatids aligned on opposite sides. FKBP6 is one of the protein components.

synaptophysin an integral membrane glycoprotein of the physin family that occurs in presynaptic vesicles of neurons and in similar vesicles of the adrenal medulla. It is a marker protein for neuroendocrine cells and neoplasms.

synaptosome any of the discrete particles (nerve-ending particles) formed from the clublike presynaptic nerve endings that resist disruption and are snapped or torn off their attachments when brain tissue is homogenized in media isosmotic to plasma. In synaptosomes the main structural features of the nerve endings are preserved.

synaptosome-associated protein *see* **SNAP** (def. 2).

synaptotagmin an abundant integral membrane protein of synaptic vesicles and chromaffin granules, with a proposed role in membrane interactions during trafficking of synaptic vesicles at the active zone of the synapse. The primary structure contains two copies of a repeat that is homologous to the regulatory domain of protein kinase C.

synarchic regulation *see* **synarchy**.

synarchy cooperation between two intracellular messengers (e.g. cyclic AMP and Ca^{2+}) that act in concert to activate intracellular pathways.

SynCAM *abbr. for* synaptic cell adhesion molecule; a brain-specific type I integral membrane protein that mediates homophilic cell adhesion at synapses. The longest transcript encodes 456 amino acids, organized into three extracellular immunoglobulin-like domains, a transmembrane segment, and an intracellular **PDZ domain**.

syncatalytic synchronous with the catalytic process.

synchrotron an apparatus used in nuclear physics that accelerates particles of atomic size through an electric field. The particles are initially charged by an ion source, and their path may be linear (**linear accelerator**) or of spiral form (**cyclotron**). The acceleration imparts a high kinetic energy to the particles, which can lead to structural changes in the particles. One use of a synchrotron, therefore, is the production of radioactive or other nuclides for use in biology or medicine. A synchrotron radiation source is a circular storage ring in which electrons are accelerated in a magnetic field.

synclinal 1 *abbr.*: **syn-**; describing one of the two possible conformations of the base and sugar ring in a nucleotide, the other being the **anticlinal** conformation. *See* **conformation**. 2 or (*sometimes*) **gauche** or **skew** *abbr.*: **sc-**; describing a particular staggered conformation of a molecule in which the **torsion angle** is within $\pm 60^\circ$ of 0° . *See* **conformation**.

syncytium (*pl.* **syncytia**) a mass of cytoplasm containing several nuclei enclosed within a single plasma membrane. Syncytia are normally derived from single cells that fuse or fail to complete cell division. Examples are muscle fibres, formed by fusion of **myoblasts**, and residual bodies formed during **spermatogenesis**.

SYND2 *abbr. for* syndecan-2. *See* **syndecan**.

syndapin 1 a cytosolic protein that contains an SH3 domain, binds dynamin of the cytoskeleton, and is involved in vesicle budding at

the plasma membrane. It also binds the brain-specific **synaptojanin** and **synapsin I**.

syndecan a type I integral membrane proteoglycan that links the cytoskeleton to the interstitial matrix. It bears heparin sulfate and chondroitin sulfate, and binds to bFGF (*see* **fibroblast growth factor**) with high affinity, and also to components of the extracellular matrix. Its intracellular domain binds to the actin cytoskeleton.

syndein *an alternative name for ankyrin*.

syndesine a di(α -amino acid) isolated from hydrolysates of certain **collagens**, in which it forms covalent cross-links between adjacent polypeptide strands. It is formed by **aldol condensation** between the side chains of a residue of **allysine** and one of **hydroxyallysine**; two isomers are possible.

syndiotactic having or relating to a regular alternation of differences in stereochemical structure in the repeating units of a polymer. *Compare* **isotactic**.

syndrome a set of concurrent symptoms characteristic of a particular pathological state.

syndrome X *see* **hyperinsulinemia syndrome**.

Syne *abbr. for* synaptic nuclei expressed; either of two proteins found enriched at the nuclear envelope of myonuclei clustered at neuromuscular junctions. They are probably involved in anchoring nuclei to the cytoskeleton. Syne-1 (human: 8739 amino acids) and Syne-2 (6855 amino acids) each contain actin-binding domains, large central domains of spectrin repeats, and a C-terminal nuclear envelope transmembrane domain. Mouse homologues have been partially characterized. Syne proteins are homologous with ANC-1 (of *Caenorhabditis elegans*) and Msp-300 (of *Drosophila*).

synemin a protein, M_r 230 000, found in the Z disk of skeletal and cardiac muscle cells, and in **intermediate filaments** of some non-muscle cells. It binds tightly to **desmin**.

synenkephalin or **proenkephalin 1–70** a derivative of **proenkephalin** secreted as an intact molecule or as a part of precursors in the adult brain and adrenal medulla. It has the immunoreactivity of proenkephalin, but does not contain the enkephalin sequence.

syneresis or **synaeresis 1** (*in chemistry*) the separation of liquid from a gel caused by contraction of the gel structure. **2** (*in pathology*) the gradual contraction of a blood clot that occurs after its formation, leading to a more solid mass that seals the ruptured blood vessel.

synergism 1 the phenomenon whereby the effect of two or more agonists together is greater than the sum of their effects when used individually. **2** the concerted action of two muscles to enhance their combined effects. *Compare* **antagonism**. —**synergetic** or **synergistic** *adj.*

synergist 1 an agent that increases the effectiveness of another agent. **2** a muscle that acts in concert with another muscle to increase its effect. *Compare* **antagonist**.

synexin or **annexin VII** a cytosolic Ca^{2+} -dependent, lipid-binding protein belonging to the **annexin** family. Originally isolated from adrenal medullary cells, isoforms have since been found in skeletal muscle, brain, and liver, and also in *Dictyostelium discoideum*. Adrenal medulla and liver have isoforms of 47 kDa and 51 kDa, while skeletal muscle has only the 51 kDa isoform. Synexin promotes membrane fusion, aggregates isolated chromaffin granules, and forms voltage-dependent calcium channels in artificial and natural membranes.

syngamy the union of the nuclei of two gametes to form the single nucleus of the zygote during fertilization; sexual reproduction. —**syngamic** or **syngamous** *adj.*

syngenic of or pertaining to cell types in an experimental mammalian chimera that are antigenetically similar. *Compare* **allogenic**.

synologue or (*esp. US*) **synolog** a gene transferred to a species from another during or after the fusion of the two species. Examples are genes transferred to the eukaryotic cell from the endosymbionts that have evolved into the mitochondria and chloroplasts. *Compare* **xenologue**.

synology the transfer of genes between organelles and the nucleus. —**synological** or **synologic** *adj.*; —**synologically** *adv.*

synonym codon a **synonym triplet** in messenger RNA.

synonymous codon usage *abbr.*: SCU; the frequency with which a codon is used relative to its synonymous alternative(s) in a partic-

ular species, gene, or group of genes. Synonymous alternatives are not used with equal frequency; *see* **codon usage bias**.

synonymous mutation *an alternative name for silent mutation*.

synonym triplet any of two or more trinucleotides of a nucleic acid that can specify the same amino acid. In messenger RNA the term is synonymous with **synonym codon**.

synovia or **synovial fluid** the fluid surrounding a joint or filling a tendon sheath.

synovial membrane or **synovium** the membrane of mesothelial cells and connective tissue that surrounds a joint; it secretes the **synovia**.

synovium *an alternative name for synovial membrane*.

syneriplanar *see* **conformation**.

syntaxin a SNAP receptor (**SNARE**) involved in docking of synaptic vesicles at the presynaptic zone of a **synapse**.

synteny the state in which genes or other loci reside together in a linkage group, i.e. on the same chromosome. Conserved synteny denotes that homologous genes occur in the same linkage groups across the genomes of different species. —**syntenic** *adj.* —**syntenically** *adv.*

synthase an enzyme that catalyses a condensation reaction in which no nucleoside triphosphate is required as an energy source. *Compare* **synthetase**.

synthase kinase glycogen synthase α kinase. *See* **non-specific serine/threonine protein kinase**.

synthesis (*in chemistry*) the production of a more complex molecule from simpler reagents by one or a series of reactions. —**synthesize** or **synthesise** *vb.*

synthesizer or **synthesiser** an instrument that automates a chemical synthesis, especially of peptides or oligonucleotides.

synthetase an enzyme that catalyses a condensation reaction in which a nucleoside triphosphate is required as an energy source. *Compare* **synthase**.

synthetic 1 of, or pertaining to, **synthesis 2** (of a substance or material) chemically synthesized as opposed to prepared from recognizable natural materials. Such a product is identical chemically to that isolated from the natural source.

synuclein a brain presynaptic protein that is expressed also in other tissues, but at very low levels. It is highly conserved, rodent and zebrafish α synucleins being 95% and 86% identical to human. Some mutations are linked to familial **Parkinson's disease**.

synxenic pertaining to the growth of organisms of a single species in the presence of one or more other species. Cultures in which one, two, three, or more other species are involved are described, respectively, as **monoxenic**, **dixenic**, **trixenic**, or **polyxenic**. *Compare* **axenic**. —**synxenity** *n.*; **synxenize** or **synxenise** *vb.*

synxenite the principal organism being studied in a **synxenic** culture.

syringomycin a cyclic lipodepsipeptide-containing nonprotein amino acids and forming cation-permeable pores. It is produced by the Gram-negative bacterium *Pseudomonas syringae* and is classified in the TC system under number 1.D.2.

syringopeptin a channel-forming cyclic lipodepsipeptide similar to **syringomycin**. It is classified in the TC system under number 1.D.3.

syrup or **sirup 1** a thick, sticky, viscous liquid consisting of a concentrated aqueous solution of sucrose. **2** the concentrated juice of a fruit or plant, especially of sugar cane. **3** any solution that is thick, sticky, and viscous.

system A a transport system for the uptake of neutral amino acids by animal cells. It prefers amino acids having short, polar or linear side chains, including the nonmetabolizable 2-aminoisobutyric acid. Transport is sodium ion-dependent and is reduced by lowered extracellular pH. **System ASC**, prominent in erythrocytes, is distinguished from system A on the basis of pH insensitivity and higher stereospecificity. *See also* **sodium/neutral amino acid cotransporter**, **system L**, **system N**.

system ASC *see* **system A**.

systematic evolution of ligands by exponential enrichment *abbr.*: SELEX; an iterative method for selecting high-affinity aptamers using directed molecular evolution to enrich oligonucleotide mixtures with respect to their ability to bind a target.

systematic name 1 (*in organic-chemical nomenclature*) a name of a molecule that is composed wholly of specially coined or selected syllables, with or without numerical affixes and locants; e.g. oxazole,

pentane, cyclohex-2-en-1-ol. Such a name unequivocally specifies the complete chemical structure of a particular molecular entity. *Compare semisystematic name, trivial name.* **2** (*in enzyme nomenclature*) a name of an enzyme that describes its catalytic action as exactly as possible, thus identifying the enzyme precisely and permitting a code number to be assigned to it. Thus all proteins having the same catalytic property share the same systematic name and code number. The systematic name consists of the name of the substrate or, in the case of a bimolecular reaction, of the two substrates separated by a colon (with small and equal spaces before and after the colon); and the nature of the catalysed reaction, ending in '+ase'.

systematics *functioning as sing.* **1** the study of systems, especially the principles of classification. **2** (*in biology*) the discipline that deals with classification and nomenclature.

Système International *abbr.:* SI; *Système International d'Unités*; a system of units based on the metric system. *See SI units.*

systemic concerning the whole body of an animal or a whole plant rather than an individual part.

systemic circulation the blood vessels supplying all parts of the body except the lungs.

systemin an 18-residue polypeptide, isolated from tomato leaves, that acts as a potent activator of plant protease inhibitor genes. It induces synthesis of two protease inhibitors in tomato and potato leaves. It is the only plant polypeptide hormone-like signalling molecule presently known. It has the sequence

AVQSKPPSKRDPKMQTD,

and is proteolytically processed from a 200-residue precursor, **prosystemin**. Plant protease inhibitors are induced by wounding, e.g. by insects or pathogens, and may be part of the plant defence mechanisms.

system L a transport system responsible for the uptake of neutral amino acids by animal cells. It prefers branched-chain and aromatic amino acids such as leucine, isoleucine, valine, phenylalanine, and the nonmetabolizable analogue 2-aminobicyclo-[2,2,1]-heptane-2-carboxylic acid (BCH). The transport mechanism is sodium-ion-independent and may be stimulated by lowered extracellular pH. It is present in a wide variety of animal cell types, including avian and mammalian. *See also sodium/neutral amino-acid cotransporter, system A, system N.*

system N a sodium-ion-dependent transport system responsible for the uptake of asparagine, glutamine, and histidine amino acids by animal cells. *See also sodium/neutral amino acid cotransporter, system A, system L.*

systems biology the study of biology as an interconnected system of dynamic, interdependent genetic, metabolic, cellular, and pathway events (rather than as a set of individual molecular components), in an attempt to understand how emergent properties appear at increasing levels of complexity and hence how biological systems function as an integral whole.

systole a rhythmical repeated contraction, as of the chambers of the heart or of a pulsating vacuole. *Compare diastole.* —**systolic** *adj.*

Tt

t 1 *symbol for a tert+* (i.e. **tertiary**) in a chemical name (alternative to *t*). **b triton** (def. 2). **2** *abbr. for terminator sequence*.

t *symbol for 1 time*. **2** Celsius temperature (alternative to θ). **3** transference number.

t *abbr. for 1 tert-*. **2** *trans-*.

$t_{1/2}$ *symbol for half-life*. See also $T_{1/2}$.

T *symbol for 1 tera+* (SI prefix denoting 10^{12} times). **2** tritium. **3** tesla.

4 a residue of the α -amino acid L-threonine (alternative to Thr). **5** a residue of the base thymine in a nucleic-acid sequence. **6** a residue of the ribonucleoside ribosylthymine (*not* thymidine, i.e. deoxyribosylthymine; alternative to Thd). **7** twist number.

T *symbol for 1 thermodynamic temperature*. **2** transmittance. **3** period. **4** kinetic energy (alternative to E_K or K).

-T conformational descriptor designating the **twist conformation** (def. 2) of a five-membered ring form of a monosaccharide or monosaccharide derivative. Locants of ring atoms that lie on the side of the structure's reference plane from which the numbering appears clockwise are indicated by left superscripts and those that lie on the other side of the reference plane are indicated by right subscripts; e.g. 1,2-*O*-isopropylidene- β -L-idofuranose- 3T_2 . See also **conformation**.

$T_{1/2}$ *symbol for half-life of a radionuclide* (alternative to $t_{1/2}$).

T_1 *symbol for spin-lattice relaxation time, longitudinal relaxation time*.

T_2 *symbol for spin-lattice relaxation time, transverse relaxation time*.

T_m or t_m or Θ_m *symbol for melting temperature*.

T_t *symbol for transition temperature*.

T1 *abbr. for bacteriophage T1, a T-odd phage*.

T2 1 or **T₂** *symbol for L-diiodothyronine*. **2** *abbr. for bacteriophage T2, a T-even phage*.

T3 1 or **T₃** *symbol for L-triiodothyronine*. **2** *abbr. for bacteriophage T3, a T-odd phage*.

T4 1 or **T₄** *symbol for L-tyroxine*. **2** *abbr. for bacteriophage T4, a T-even phage*.

T6 *abbr. for bacteriophage T6, a T-even phage*.

T7 *abbr. for bacteriophage T7, a T-odd phage*.

tA *symbol for N⁶-(threonylcarbamoyl)adenosine; see hypermodified base*.

Ta *symbol for tantalum*.

TACE see **ADAM-17**.

tachometer an instrument that measures the speed at which any object is rotating. —**tachometric** *adj.*; **tachometry** *n*.

tachy+ *comb. form* denoting fast or rapid.

tachykinin any of a group of closely related vasoactive peptides characterized by a rapid stimulant effect on vascular (and extravascular) smooth muscle, producing hypotension (*compare* **bradykinin**). They also have a direct effect on nervous tissue, and stimulate salivary and lachrymal secretion. Naturally occurring tachykinins are oligopeptide amides containing 10–12 amino-acid residues, and terminating in the common sequence -Phe-Xaa-Gly-Leu-Met-NH₂ (where Xaa = Phe, Tyr, Ile, or Val). Mammalian tachykinins include neuromedin K, **neurokinin A** (formerly substance K) and **substance P**; others (e.g., **eledoisin**, **physalaemin**) occur in amphibians and octopods. Substance P and neurokinin A are generated from a preprotachykinin protein precursor (see **protachykinin β precursor**). The primary mRNA transcript is differentially processed into three mature mRNAs: α , β , and γ ; the β and γ preprotachykinin mRNAs are predominant in the rat, each encoding substance P and neurokinin A.

tachykinin receptor any G-protein-associated membrane protein that binds **tachykinins** and mediates their transmembrane action. There are three classes: (1) NK₁ (407 amino acids, human), agonist potency: substance P (SP) > neurokinin A (NKA) > neurokinin B (NKB); (2) NK₂ (398 amino acids, human), agonist potency: NKA > NKB >> SP; and (3) NK₃ (452 amino acids, rat), agonist potency: NKB > NKA > SP. In all, ligand binding activates phospholipase C.

tachyphylaxis a decline in the response to repeated application of an agonist. See also **desensitization**, **fade**.

tachyplesin any peptide antibiotic of arthropods, 17 or 18 amino acids long and with a C-terminal arginine α -amide. Tachyplesins are abundant in hemocyte debris of horseshoe crabs (*Tachyplesus* spp.), and are active against Gram-positive and Gram-negative bacteria, and fungi such as *Candida albicans*. It is classified in the TC system under number 1.C.34.

tac promoter a constructed hybrid **promoter** that contains the -35 sequence of the *trp* promoter and the -10 sequence of the *lacZ* promoter. See **minus 10 region**.

Tacrolimus see **FK506**.

-tactic refers to the ability of a motile cell or organism to move along a gradient, e.g. of a chemical (chemotactic) or light (phototactic).

tactic polymer a regular polymer in whose molecules there is an ordered structure with respect to the configurations around at least one main-chain site of stereoisomerism per **constitutional base unit**.

tactile capable of exciting the sense of touch; relating to the sense of touch (as a sense organ).

tactoid a **paracrystal**-like aggregate; the term may be applied to the rodlike filaments of hemoglobin that form in **sickle cells**, or to assemblies of virus particles (e.g. of tobacco mosaic virus).

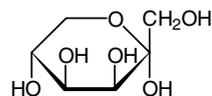

TAE a buffer for agarose gel electrophoresis comprising 40 mM Tris-acetate and 1 mM EDTA.

tafazzin one of a family of acyl-CoA synthetases that is important in cardiolipin synthesis. Mutations in the gene locus (at Xq28) produce **Barth syndrome**.

tag 1 to identify by a marker; for example, a cell may be tagged by attachment of a (fluorescent or radiolabelled) antibody. **2** an identifier used in tagging.

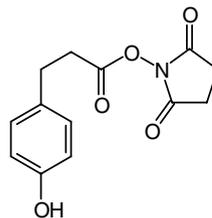

Tagamet see **cimetidine**.

D-tagatose a *nonsystematic name* for D-lyxo-2-hexulose, a hydrolysis product of some plant gums.

α -D-pyranose form

Tagit a *proprietary name* for *N*-succinimidyl 3-(4-hydroxyphenyl) propionate; it is used in the preparation of **Bolton and Hunter reagent** for tagging peptides and proteins with radioiodine.

tail 1 an extension growing or appending from a point of origin or attachment. For example, the fatty-acyl groups of a phospholipid and the glycerol to which they are bonded are referred to as the tail. *Compare* **headgroup**. **2** (*in chromatography*) a region of more slowly moving or decomposed material extending back from a band towards the **origin**. See also **poly(A) tail**, **tailing**.

tailing 1 the addition of a stretch of identical nucleotides to the ends

of a restriction fragment using **terminal deoxynucleotidyl transferase**. **2** the spreading out of a band or spot in a chromatographic process.

TAIL PCR *abbr.* for thermal asymmetric interlaced polymerase chain reaction; a method for finding previously unknown sequences adjacent to known sequences in genomes. It is useful for recovering sequences flanking sites of insertional mutagenesis caused by integration of a plasmid, T-DNA, or transposon.

Takahara disease *an alternative name for acatalasemia.*

Takifugu rubripes *see* fugu.

Tal *symbol* for a residue, or sometimes a molecule, of **talose**.

taloric acid one of the **hexaric acids**; *see also* **aldaric acid**.

talc a soft mineral composed of hydrated magnesium silicate, $Mg_3Si_4O_{10}(OH)_2$, with small quantities of metal impurities. In its powdered form it is known as talcum powder, or French chalk, and in granular form as soapstone (steatite). Powdered talc is used as a lubricant, as a filler in paper and other products, and in cosmetics, etc.

talcum powder powdered **talc**.

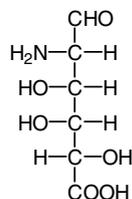

talin a protein involved in connections between the cytoskeleton and the plasma membrane. A phosphoprotein, it binds strongly to **vinculin**, and less strongly to **integrins**. It is a founder member of the **TERM** family.

talo+ or (*before a vowel*) **talos+** *comb. form* of **talose**.

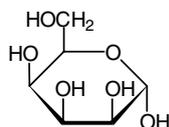

talo- *prefix (in chemical nomenclature)* indicating a particular configuration, a set of (usually four) contiguous CHOH groups as in the acyclic form of D- or L-**talose**. *See also* **monosaccharide**.

talopectin *N*-(6-deoxy- α -L-talopyranosyl-oxyphospho)-L-leucyl-L-tryptophan; an inhibitor of several metallopeptidases, including **thermolysin**. *Compare* **phosphoramidon**.

talosaminouronic acid a component of the **peptidoglycan** of archaea.

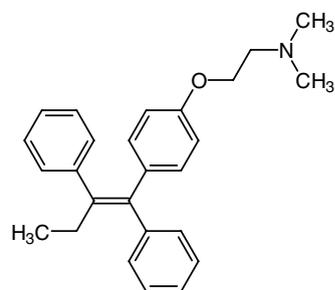

talose *symbol*: Tal; *the trivial name* for the aldohexose *talo*-hexose, which differs from glucose in the configuration of the groups at C-2 and C-4; there are two enantiomers.

α -D-talose

Tamm-Horsfall glycoprotein or **uromodulin** the principal glycoprotein of human urine. It occurs in other species, e.g. the cow and rat. The molecule is filamentous, with an M_r of several million, and is composed of subunits of $M_r \sim 80\,000$; it contains about 25% carbohydrate and a small amount of lipid. An abnormally high M_r is observed in cystic fibrosis. *See also* **proteinuria**. [After Igor Tamm (1922–71), US virologist, and Frank Lappin Horsfall (1906–71).]

tamoxifen [Z]-2-[4-(1,2-diphenyl-1-butenyl)-phenoxy]-*N,N*-dimethylethanolamine; an estrogen antagonist used in the treatment of breast cancer and suggested for prophylaxis in women with a family history of breast cancer. It can behave as a pure estrogen agonist, a partial agonist, or an antagonist, depending on the species of animal, the target organ examined, and the endpoint measured. It is a **genotoxic** carcinogen in the rat.

tan *abbr.* for tangent (def. 1).

tandem affinity purification *abbr.*: TAP; a separation technique designed to isolate protein complexes, whereby an IgG-binding domain sequence tag is added to the gene for a target protein, and the protein is synthesized with the section encoded by the tag. Proteins with the domain are separated from a mixture using an affinity column containing IgG beads, to which they stick. If the target protein is part of a complex, proteins associated with it are also retained on the column.

tandem-crossed immunoelectrophoresis *see* **crossed immunoelectrophoresis**.

tandem mass spectrometry *abbr.*: MS/MS; a separation technique in which samples are first ionized and then subjected to two or more sequential stages of **mass spectrometry** analysis using either laser-based methods – e.g. MALDI (matrix-assisted laser desorption/ionization) and SELDI (surface-enhanced laser desorption and ionization) – or electrospray-based (e.g. ESI) methods.

tandem repeat 1 (of DNA sequences) an arrangement in which two or more copies of a particular base sequence are situated immediately one after the other. Tandem repeats are commonly found in **telomeres**, the repeated sequence being characteristic of species and source of DNA, and of relatively short length (up to about 10 bases). They also occur in **highly repetitive DNA**. **2** (of genes) a cluster of adjacent multiple copies of the same gene. The genes for ribosomal RNA (rRNA) are characteristically contained in tandem clusters, sometimes referred to as **ribosomal DNA** (rDNA). *See also* **concatemer**.

Tanford-Kirkwood theory a theory of protein titration curves based on a model in which the charges are taken to be discrete unit charges located at fixed positions on the protein molecule. [After Charles Tanford (1921–) and John Gamble Kirkwood (1907–59).]

tangent 1 *abbr.*: tan; a function of an angle, being, in a right-angled triangle, the ratio of the side opposite the given angle (if acute) to that of the side opposite the other acute angle. The tangent of an obtuse angle is numerically equal to that of its supplement but of opposite sign. **2** a straight line that touches, but does not cut, a curve or a curved surface.

tangential-flow filtration a convenient and rapid method of concentrating cells, cell organelles, or other particulate material, or for eliminating such material from suspensions. In a special apparatus, the suspension flows over (“tangential flow”) a semipermeable membrane; only material smaller than the membrane pores will pass through the membrane, forming the filtrate, leaving larger matter to be collected (retentate).

Tangier disease a rare autosomal recessive condition in humans in which there is a deficiency or complete absence of **high-density lipoprotein**. Homozygotes have very low levels of **apolipoprotein A-I**. There is accumulation of cholesterol esters in cells of the mononuclear phagocyte system. The condition is relatively benign as organ function is not affected. [After Tangier Island, Chesapeake Bay; the disease was first found in inhabitants of this island.]

tankyrase a 142 kDa protein associated with telomeres in human cells, and also present in the Golgi apparatus, the nuclear pore complex, and mitotic centrosomes. It has a catalytic domain homologous to that of **PARP-1**, and 24 tandem repeats of the ankyrin motif.

It does not require DNA for activity and has **TEP-1** as substrate, causing release of the latter from telomeric DNA.

tannic acid or **tannin** or **gallotannin** or **gallotannic acid** *an imprecise term used for a mixture of hydrolysable tannins* (def. 1).

tannin **1** any polyphenolic plant product that can be used to tan animal skins to produce leather. Tannins are divided into **hydrolysable tannins** (the larger group) and **condensed tannins**. The former consist of a polyhydric alcohol, usually glucose, esterified with either gallic acid or hexahydroxydiphenic acid. Condensed tannins are polymers of flavans, never contain sugar residues, and are often termed **flavolans**. Tannins form insoluble tannates with proteins, which forms the basis of **tanning** (def. 1). The release of tannins during the extraction of plant enzymes can lead to formation of insoluble enzyme tannates. The addition of polyvinylpyrrolidone may help to avoid this problem. Good tanning agents should have an M_r of between 500 and 3000 and contain sufficient phenolic hydroxyl groups (1–2% of M_r) to form effective cross-links with protein. **2** a common name for **tannic acid**.

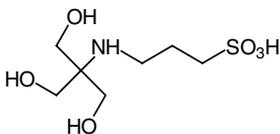

tanning **1** a technique, known by the Egyptians around 3000 BC, for producing leather from animal skins by the use of **tannin** (def. 1). Modern methods using chrome salts are faster, taking a few hours rather than weeks. **2** the treating of red blood cells with tannic acid. Such cells are used in a test for anti-thyroglobulin antibodies, after they have been treated with thyroglobulin. The tanning enhances sensitivity.

T antigen **1** any early gene product of a genetic locus of certain transforming DNA viruses, including adenovirus, simian virus 40 (SV40), and polyoma virus. The substance originally detected in nuclei of transformed cells by immunofluorescence (hence ‘T’ for tumour or transformation) led to the identification of several early proteins that are needed for replication. Two products are formed by SV40, known as **large T antigen** (or T antigen) and **small t antigen** (or t antigen). Polyoma virus produces large T antigen, middle T antigen, and small t antigen. Large T antigen of SV40 alone is sufficient to immortalize primary rodent cells and transform established rodent cell lines. It is a multifunctional protein that is a potent transcriptional activator which activates promoters containing a TATA box or initiator element and at least one upstream transcription-factor-binding site. Middle T antigen of polyoma virus is essential for polyoma-virus-mediated tumorigenesis and cell transformation. It activates cellular tyrosine kinases, including c-Src, c-Yes, and Fyn, and binds phosphatidylinositol 3-kinase and protein phosphatase 2A. Small t antigen of SV40 has a helper effect in SV40 transformation. It binds protein phosphatase 2A and regulates the phosphorylation and transcriptional transactivation of **CREB protein**. It stabilizes p53 in a manner that correlates with enhanced transformation efficiency of SV40. **2** an antigen found on normal human erythrocytes that is unreactive unless the cells are first treated with neuraminidase. **3** one of the principal protein antigens in the cell wall of *Streptococcus* spp. **4** *abbr.* for transplantation antigen (i.e. a class I MHC antigen); see **major histocompatibility complex**.

TAP *abbr.* for tandem affinity purification.

tapeworm any parasitic flatworm (phylum Platyhelminthes) belonging to the class Cestoda.

Taps or **TAPS** *abbr.* for *N*-tris(hydroxymethyl)methyl-3-aminopropanesulfonic acid; 3-[2-hydroxy-1,1-bis(hydroxymethyl)ethyl]-amino propanesulfonic acid; a **Good buffer substance**, pK_a (20°C) = 8.4.

Taq DNA polymerase a heat-stable DNA polymerase from the thermophilic bacterium *Thermus aquaticus*. It is widely used in the **polymerase chain reaction** (PCR). The enzyme lacks 3'→5' exonuclease activity and therefore has no proofreading function. It has a template-independent terminal transferase activity with a prefer-

ence for the addition of deoxyadenosine to the 3' ends of PCR products.

Tar a protein that serves as a multifunctional receptor of *E. coli*, used for detection of aspartate and temperature. This capability involves methylation at up to eight sites in the protein's cytoplasmic domain.

TAR *abbr.* for tape archive; a file format (not necessarily on a tape) used on UNIX (or Linux) computers. TAR files usually have the extension .tar; they are not **compressed** but might be compressed in which case the extension would become .tar.Z or .tar.gz. The program tar is needed to extract the files from the archive.

tare **1** to compensate for the weight of a container, etc. when weighing, by adjusting the balance to zero with the empty container in place before adding the material to be weighed. **2** the weight of the tared vessel or material.

target the object at which an action or process is directed. For example, a **target cell** is the cell under attack by a cytolytic or killer cell or other cytolytic agent, and a **target tissue** is the tissue that is acted on by any hormone, growth factor, or other agonist. See also **drug target**.

target discovery or **target identification** the process of identifying a biological entity (usually a protein or gene) that interacts with, and whose activity is modulated by, a particular compound. Once a suitable target has been identified, it may then go on to **target validation**.

targeting subunits protein subunits that specify the location and catalytic and regulatory properties of protein phosphatases and kinases.

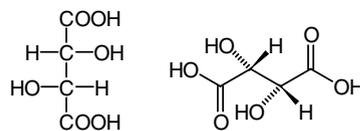

target repeat see **transposon**.

target site the site where a **restriction endonuclease** cleaves a DNA molecule; usually the **recognition site** (def. 2).

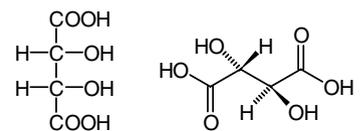

target theory (*in radiation chemistry*) a theory stating that all single hits on biologically active macromolecules by particles or quanta of ionizing radiation result in damaged and inactive molecules, that no partially active molecules are formed, and that all unhit molecules retain full activity.

target validation the process by which the role of a target (usually a specific gene or protein) is confirmed within a pathogenic process.

tartaric acid 2,3-dihydroxybutanedioic acid; 2,3-dihydroxysuccinic acid; an **aldaric acid** formed by oxidation of a **tetrose** at C-1 and C-4. The $L_g(+)$ (see **d/l convention**), or 2*R*,3*R*, enantiomer occurs widely in plants, especially grape juice, and in fungi and bacteria; the $D_g(-)$ (or 2*S*,3*S*) enantiomer and *meso* form have limited distribution in plants. The racemic mixture, DL-tartaric acid, sometimes occurs during wine manufacture; it was originally known as **paratartaric acid**. The first determination of an absolute configuration by anomalous dispersion of X-rays was made on sodium rubidium L(+)-tartrate in 1951. The property of **optical activity** of some substances was first described by **Pasteur** in experiments with crystals of sodium ammonium tartrate.

L-form

meso-form

Tarui disease *an alternative name for glycogen disease* type VII.

tasiRNA *abbr* for trans-acting siRNA, siRNAs that direct cleavage of endogenous mRNAs having a region of complementarity to the siRNAs but little overall resemblance to the genes from which the siRNAs were transcribed.

tat a membrane protein complex, found in bacteria and plants, that carries folded proteins (with their cofactors) in their intact state through energy-transducing membranes. The system recognizes the **twin-arginine** motif in the protein to be transported.

TATA-binding protein *abbr.*: TBP; a component of transcription factor IID (*see* TFIID). *See also* RNA polymerase.

TATA box or **Hogness box** a base-sequence element common in eukaryotic promoters, characterized by the consensus TATAAAA. It binds a general transcription factor and specifies the position where transcription is initiated.

tau I *symbol*: τ (lower case) or T (upper case); the nineteenth letter of the Greek alphabet. For uses *see* Appendix A. 2 an alternative name for transcription factor TFIIC; *see* TFIIC.

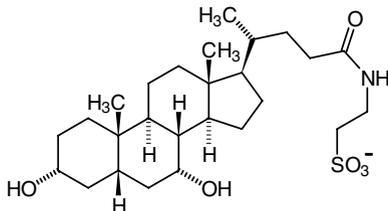

tau protein a microtubule-associated protein that promotes microtubule assembly, and stabilizes microtubules. It constitutes at least a part of the paired helical filament (PHF) core found in **Alzheimer's disease**.

tau-protein kinase EC 2.7.11.26; a protein serine/threonine kinase that phosphorylates tau protein.

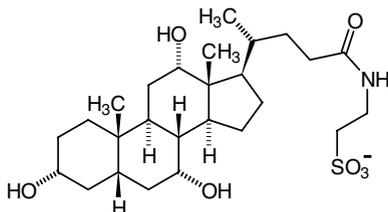

taurine 2-aminoethanesulfonic acid; it is derived metabolically from cysteine by oxidation of the sulfhydryl group to sulfoxide followed by decarboxylation of the resulting cysteic acid. *N*-conjugated with cholic acid, it forms the bile salts **taurochenodeoxycholate**, **taurocholate**, and **taurodeoxycholate**.

taurochenodeoxycholate the anionic form of the amido conjugate of taurine and chenodeoxycholate. It is a major bile acid.

taurocholate the anionic form of taurocholic acid, *N*-cholytaurine, a major bile salt of humans and other mammals. It is useful as an anionic bile-salt detergent (aggregation number 4; CMC 3–11 mM). Taurine conjugates of other bile acids are known, e.g. **taurochenodeoxycholate** and **taurodeoxycholate**.

taurocyamine *N*-(aminoiminomethyl) taurine, found in marine polychaete worms. The guanidine group can be phosphorylated to form phosphotaurocyamine, which acts as a **phosphagen**.

taurodeoxycholate the anionic form of taurodeoxycholic acid, *N*-(7-deoxy)cholytaurine. It is useful as an anionic bile-salt detergent (aggregation number 6; CMC 1–4 mM).

taurolipid any lipid consisting of a non-hydroxy fatty acid esterified with a hydroxy group of tri-, tetra-, or pentahydroxystearic acid in

amide linkage with taurine. Taurolipids are characteristic of the protozoan *Tetrahymena*.

tauryl the acyl group, $\text{H}_2\text{N}-\text{CH}_2-\text{CH}_2-\text{SO}_2-$, derived from taurine.

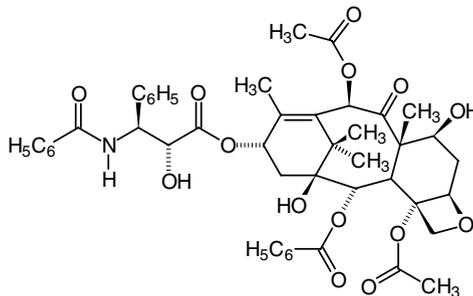

taut form *abbr.*: T form; *see* tense form, **Monod-Wyman-Changueux model for allosteric interaction**.

tautomer any of the alternative structures that may exist as a result of **tautomerism**.

tautomerism a form of constitutional isomerism in which a structure may exist in two or more constitutional arrangements, particularly with respect to the position of hydrogens bonded to oxygen. The isomers, or tautomers, are readily interconvertible and exist in equilibrium. The best-known example is **keto-enol tautomerism**, in which the structures $\text{X}-\text{C}(=\text{O})-\text{CH}_2-\text{X}$ (keto) and $\text{X}-\text{C}(\text{OH})=\text{CH}-\text{X}$ (enol) exist, in proportions determined by the equilibrium position for the conditions pertaining (normally strongly favouring the keto form). Other examples include quinone-quinol and **amino-imino tautomerism**. —**tautomeric** *adj.*

-taxis refers to the movement of a motile cell or organism along a gradient, e.g. of a chemical (chemotaxis) or light (phototaxis).

taxol an antitumour and antileukemic agent isolated from the bark of the Pacific yew, *Taxus brevifolia*. It is used clinically to treat refractory ovarian cancer. It inhibits mitosis and blocks the cell cycle at G or M phases through enhancement of the polymerization of **tubulin** and the consequent stabilization of the **microtubules**. Taxol is manufactured semisynthetically from a material present in *T. baccata*. A total chemical synthesis has also been achieved. A compound with similar properties, isolated from the myxobacterium *Sporangium cellulosum*, is **epothilone**; this is more water-soluble than taxol and can be produced in quantity by fermentation. Taxol and its analogues are known as **taxanes**. One proprietary name is Paclitaxel. A proprietary name of a semisynthetic analogue is Docetaxel.

taxon (*pl.* taxa) a named taxonomic group of any rank; a particular taxon comprises organisms having certain genetic characters in common. Strictly, the term should be used to denote only named groups, e.g. Chordata, Hominidae, etc., not as a generic term for the ranks themselves, e.g. phylum, family, etc.

Tay-Sachs disease or **G_{M2} gangliosidosis** an inherited neurological metabolic disorder resulting from deficiency of the lysosomal enzyme, **hexosaminidase** (form A, deficiency in α chain). This leads to the accumulation of its substrate, ganglioside G_{M2} (*see* ganglioside), in the brain. The disease is relatively common (1 in 2500 live births) among Ashkenazy Jews. There is motor and mental deterioration with an exaggerated startle response to sound; by 18 months of age, most patients are blind, deaf, and spastic; they die by the age of 3 years. *See also* saposin. [After Warren Tay (1843–1927), British physician, and Bernard Sachs (1858–1944), US neurologist.]

Tb *symbol* for terbium.

TBARS *abbr* for thiobarbituric acid-reactive substances, compounds of low-molecular-mass, particularly malondialdehyde, that are formed during the decomposition of lipid peroxidation products. They are measured in order to estimate the degree of cellular damage caused by oxygen radicals.

TBE a buffer for agarose gel electrophoresis that comprises 90 mM Tris-borate and 1 mM EDTA.

TBP *abbr.* for TATA-binding protein (*see* TFIID, RNA polymerase).

tBu *abbr.* for tertiary butyl (alternative to Bu¹).

TBW *abbr.* for total body water; *see* **body water**.

Tc *symbol* for technetium.

TCA *abbr.* for **1** tricarboxylic acid. **2** trichloroacetic acid.

T-cap a protein of the Z disc of skeletal and cardiac muscle that is associated with the N-terminal portion of **titin**. Defects in T-cap or in titin lead to dilated cardiomyopathy.

T ψ C arm the base-paired segment of the clover-leaf model of **transfer RNA** to which the loop containing the base sequence T ψ C is attached (ψ = pseudouridine).

T cell *an alternative name for T lymphocyte*.

T_H cell *abbr.* for helper cell.

T-cell growth factor *abbr.*: TCGF; *an alternative name for interleukin 2*.

T-cell receptor a glycoprotein of the immunoglobulin superfamily. It is present on T-cell (**T-lymphocyte**) membranes and resembles class II MHC antigens (*see* **major histocompatibility complex**) but its α and β chains are disulfide bonded. T-cell receptors recognize target antigen in combination with MHC, transduce the signal into the T cell, probably through mediation by associated CD3 molecules (*see* **CD marker**), and bring about T-cell activation. A small number of adult T-cell receptors have γ and δ chains. This class of receptor appears first in ontogeny.

T-cell-replacing factor *abbr.*: TRF; *a former term for some interleukins*. *See* **interleukin 1**, **interleukin 5**.

TCGF *abbr.* for T-cell growth factor (i.e. **interleukin 2**).

T chain *an alternative name for secretory piece*.

tcl *see* **programming language**.

T-coffee *see* **multiple alignment program**.

TCP-1 *abbr.* for T-complex protein 1; a **molecular chaperone** that forms two stacked rings, 12–16 nm in diameter and is associated with other proteins in a 850–900 kDa complex. It is similar in function to Hsp60 (a **heat-shock protein**) in mitochondria and the **groEL** product in bacteria (*see also* **chaperonin**).

TC system a classification system of membrane transport proteins, using a five-digit designation for each of the defined and sequenced transport proteins. It comprises several classes (1 Pores and channels; 2 Electrochemical-potential-driven transporters; 3 Primary active transporters; 4 Group translocators; 5 Transmembrane electron carriers; 8 Accessory factors involved in transport; 9 Incompletely characterized transport systems), each class containing several subclasses; the subclasses are divided into families, the families into subfamilies and these then contain all the relevant individual proteins. Thus, for example, bacterial Ag⁺-exporting ATPase is TC 3.A.3.5.4.

T-DNA *abbr.* for transfer DNA; that part (23 kb) of the *Agrobacterium Ti* plasmid that is incorporated into the genome of infected plant cells. It codes for an **opine**, usually **nopaline** or **octopine**, which the transformed cells produce and the bacteria then use. Each end of the T-DNA is flanked by a nearly identical 25 bp sequence; the righthand one is essential for the transfer process.

TDP *abbr.* for **1** ribosylthymine diphosphate or ribothymidine diphosphate. **2** thymidine diphosphate (dTDP is recommended).

Tdr or **TdR** or **TDR** *abbr.* for thymine deoxyriboside (i.e. thymidine). Use deprecated; the symbol dThd is recommended.

TdT *abbr.* for **terminal deoxynucleotidyltransferase**.

Te *symbol* for tellurium.

TE a buffer commonly used for dissolving DNA and comprising 10 mM Tris-chloride and 1 mM EDTA at pH 7.4, 7.6, or 8.0.

TEA *abbr.* for **1** triethanolamine; N(CH₂CH₂OH)₃; a base used in the preparation of buffers, pK_a (25°C) 7.90. **2** tetraethylammonium; used (as the chloride) to block sympathetic and parasympathetic ganglionic transmission.

TEAE *abbr.* for the triethylaminoethyl group, (C₂H₅)₃NCH₂CH₂-. It is used in hydroxylated chromatographic support matrices, e.g. cellulose, Sephadex, to form anion-exchange columns.

α -tectorin a protein (2155 amino acids) that, like otogelin, is specific to the cochlear tectorial membrane. It contains a C-terminal transmembrane segment, an N-terminal domain similar to one in **entactin**, and four vWF domains. Several mutations are associated with an autosomal recessive form of isolated deafness.

teichoate the anionic form of **teichoic acid**.

teichoic acid any polymer occurring in the cell wall, membrane, or capsule of Gram-positive bacteria and containing chains of glycerol phosphate or ribitol phosphate residues. Additionally, carbohydrates are linked to glycerol or ribitol, and some –OH groups are esterified with D-alanine.

tektins a family of similar proteins that are adapted to the assembly of a variety of eukaryotic cell structures. Tektins have common features that adapt them to sensitive and specific associations with molecules of their own kind; they have similar amino-acid compositions: they include actin, actin-like proteins, some microtubule proteins, mitochondrial structural protein, and erythrocyte membrane proteins.

tele a designator of the position of one of the nitrogens of the histidine imidazole ring, indicating the nitrogen furthest from the side chain. It is often symbolized by τ , as in N ^{τ} . *Compare* **pros**.

teleology the doctrine or study of ends or final causes, especially as related to the evidences of design or purpose in nature; the use of design, purpose, or utility as an explanation of any natural phenomenon. An example of a teleological concept in biology is that organs are made to react for the good of the organism as a whole.

teleonomy the idea that the existence of a structure or a function in an organism must have conferred an evolutionary advantage upon that organism.

teleost any member of the infraclass Teleostei, comprising fishes with rayed fins and a swim bladder; it includes most of the extant bony fishes.

telestability the transmission of three-dimensional stability from a stable part of a macromolecule to an inherently less stable part.

telethonin a protein that colocalizes with actin in the Z disc of skeletal muscle, where it interacts with **FATZ** and, through its N-terminal 140 residues, with the same region of titin. Two nonsense mutations in the gene at 17q12 result in autosomal recessive limb-girdle muscular dystrophy type 2G.

telokin the C-terminal sequence of smooth muscle **myosin-light-chain kinase** expressed as an independent protein. It binds calmodulin.

telolysosome a **lysosome** that has accumulated so much indigestible residue that it is unable to accumulate further material to be digested. The structure still contains enzymes but these are no longer renewed. It is a type of **residual body**.

telomerase EC 2.7.7.-; *other name*: telomerase reverse transcriptase (*abbr.*: TERT); a DNA polymerase enzyme involved in **telomere** formation, and in telomere elongation to maintain the telomere sequences during replication. The catalytic subunit contains several sequence motifs characteristic of reverse transcriptase and at least one telomerase-specific motif. Activity is undetectable in most human somatic cells but is present in germ-line cells, in \approx 90% of tumours, and in immortalized cell lines. The enzyme recognizes the G-rich strand of an existing telomere repeat sequence, elongating it in the 5' to 3' direction. The yeast *Candida albicans* contains two highly homologous catalytic subunits each of 867 amino acids. In fission yeast, the core enzyme contains Est2p before the S phase, and becomes activated late in S phase when Est1p and Est3p are recruited to the core (*see* **EST1**). The RNA component includes a template for synthesizing the G-rich repeating sequence, and in humans is bound by dyskerin.

telomerase-associated protein a human protein of 2629 amino acids that interacts with the RNA component of **telomerase**. It contains two sequence repeats in the N-terminal region, a central NTP-binding domain, and WD40 repeats in the C-terminal region.

telomere the DNA–protein structure that seals either end of a chromosome. Telomeric DNA consists of simple tandemly repeated sequences specific for each species. In human germline cells the 3' end of each chromosome contains 1000–1700 repeats of the hexanucleotide TTAGGG, and the 5' end contains the complementary repeats. In somatic cells the repeat number decreases with each round of replication. Telomeric sequences are added to the 3' terminus of chromosomal DNAs by **telomerase**, thereby maintaining telomere length. **TEP-1** binds to telomeric repeats. —**telomeric** *adj.*

telomere-specific protein-1 *see* **TEP-1**.

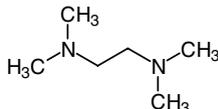

telomeric repeat-binding factor (*abbr.*: TRF) *an alternative name for* **TEP-1**.

telopeptide any of the peptides that protrude from the triple-helical body of **tropocollagen**, and have a composition different from the triple-helical portions. They are removed by proteases, with concomitant breakage of intramolecular interchain bonds. They are thought to occupy near-terminal positions. The antigenic response to injected heterologous tropocollagen is directed against these telopeptide appendages external to the triple helix.

telophase the final stage of **mitosis** or **meiosis** in which the nuclei form in the daughter cells.

TEM or **T.E.M.** *abbr.* for 1 transmission electron microscope; *see* **electron microscope**. 2 Tris-EDTA-mercaptoethanol (buffer).

TEMED *abbr.* for *N,N,N',N'*-tetramethylethylenediamine; *N,N,N',N'*-tetramethyl-1,2-diaminoethane; a polymerizing agent used in the preparation of polyacrylamide gels. It stabilizes free radicals produced by ammonium persulfate.

temperate phage a **bacteriophage** that, following infection of its host bacterium, may either enter the lytic cycle, like a **virulent phage**, or establish a symbiotic relationship with the host cell that results in its perpetuation in the descendants of the bacterium. Bacteria carrying temperate phage are said to be **lysogenic**, while the carried phage is called a **prophage**.

temperature *abbr.*: temp.; a fundamental physical quantity of a body, region, or system that determines the direction of net heat flow between it and its surroundings. If two systems have the same temperature they are in thermal equilibrium and there is no net heat flow between them. If they have different temperatures they are not in thermal equilibrium and heat flows from the system of higher temperature to that of lower temperature. Essentially there are two different methods of measuring temperature. One is to use a scale of values set up between arbitrary fixed points based on reproducible temperature-dependent events. For example, the **Celsius temperature** scale uses a freezing point and boiling point of water as fixed points, to which are assigned the values 0 and 100, respectively; the scale between them is divided into 100 degrees. Although widely used for many practical purposes, it lacks a theoretical basis and is unsuitable in many scientific contexts. Instead, the concept of **thermodynamic temperature** is used. This is defined in terms of the second law of thermodynamics (*see* **thermodynamics**) and is independent of any particular substance. However, in practice thermodynamic temperatures cannot be measured directly. Consequently, a practical realization of the thermodynamic temperature scale is used, called the **International Practical Temperature Scale (IPTS)**. This is based on a number of fixed points, and is measured in **kelvins**; it defines temperature down to 13.81 kelvins, the triple point of equilibrium hydrogen.

temperature coefficient of a reaction *symbol*: Q_{10} ; the factor by which the velocity of a chemical reaction is increased by raising the temperature, t , by 10°C . Usually it is the ratio of the rate of reaction at $(t + 10^\circ)$ to that at t , denoted by $Q_{10} = k_{t+10}/k_t$, where k_{t+10} and k_t are the rate constants at the respective temperatures. The Q_{10} value of homogeneous chemical reactions is generally in the range 2–3; many enzyme-catalysed reactions and physiological processes exhibit, over a limited range of temperatures, a Q_{10} value of ≈ 2 . *See also* **Arrhenius equation**.

temperature jump a technique used in **relaxation kinetics** for the study of enzyme mechanisms in which the temperature is raised rapidly (e.g. over about 1 μs), the reaction being monitored during this and the subsequent (very short) period during which the system relaxes to a new equilibrium.

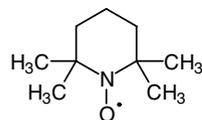

temperature-sensitive mutation a mutation that is manifest only in a limited range of temperature. The mutant carrying such a mutation behaves normally at the lower, **permissive temperature**, but when grown at the lower or higher, **restrictive temperature**, it shows the mutant phenotype.

template a macromolecule whose structure serves as a pattern for the synthesis of another macromolecule. The term applies particularly to a nucleic acid on which another nucleic acid of complementary base sequence is synthesized, as in genetic **transcription**, or in the case of messenger RNA, on which a polypeptide is synthesized (genetic **translation**).

template RNA *an alternative name for messenger RNA.*

template strand *see noncoding strand.*

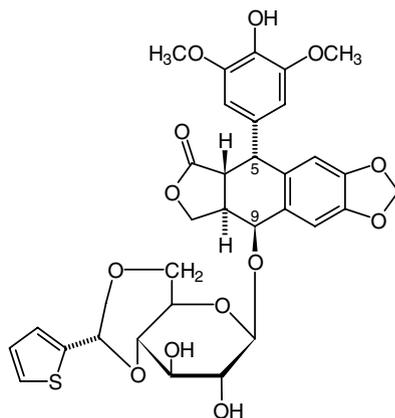

TEMPO *abbr.* for 2,2,6,6-tetramethylpiperidinoxy; 2,2,6,6-tetramethylpiperidine 1-oxyl; a stable free radical used as a spin label in electron spin-resonance spectroscopy.

temporal gene any gene that 'programs' a system in time, determining the activation of genes controlling different developmental stages in various cell types.

tenascin a glycoprotein of the extracellular matrix that is widely distributed and prominent during embryonic development, being produced by mesenchymal and glial cells. In adults it is present in small amounts in the central nervous system, cartilage, soft-tissue stroma, and close to basement membranes, but is prominent in a variety of tumours and in areas of wound healing. It consists of six identical (or similar) polypeptide chains, which radiate from a central knob, like the spokes of a wheel, with a knob at the free end of each. Several isoforms (1573 to 2203 amino acids) result from alternative splicing from one gene, and differ by tissue and time of appearance during development. The central knob contains the hydrophobic N-termini and their eight cysteine residues, which play a part in hexamer formation. Each chain contains ≈ 15 epidermal growth factor repeats and up to 15 ≈ 90 -residue fibronectin repeats, and a C-terminal 210-residue segment rich in basic amino acids. Tenascin interacts with the cell-surface transmembrane proteoglycan **syndecan** and with fibronectin. It promotes or inhibits cell adhesion depending on cell type. *Other names*: hexabrachion; cytactin; neuronectin; gmem; ji; myotendinous antigen; glioma-associated extracellular matrix antigen; gp150-225.

teniposide a semisynthetic lignan derivative prepared from **podophyllotoxin**. It acts like **etoposide**, but is a stronger cytotoxin.

ten-minute phosphate *see labile phosphate.*

tense form or **taut form** *abbr.*: T form; the form of an allosteric protein that has a lower affinity for a ligand than the R form (**relaxed form**). *See* **Monod-Wyman-Changeux model (for allosteric interaction)**.

tenside any of the group of surface-active compounds widely known as **detergents**. The name derives from their effects on surface tension.

tension 1 the concentration of a gas expressed as the partial pressure of the gas. **2** the force exerted by stretching any material. **3** voltage, electromagnetic force, or potential difference, as in high tension, low tension.

tensor 1 (*in mathematics*) a quantity expressing the ratio in which the length of a **vector** is increased. *Compare scalar.* **2** (*in anatomy*) a muscle that stretches or tightens some part while not altering the direction of the part.

tentoxin cyclo[L-leucyl-N-methyl-(Z)-dehydrophenylalanyl-glycyl-N-methyl-L-alanyl]; a cyclic tetrapeptide isolated from *Alternaria alternata*. It induces chlorosis in some plant species when applied to the germinating seedling.

TEP-1 *abbr. for telomere-specific protein-1; other name:* telomeric repeat binding factor (*abbr.:* TRF); a protein (439 amino acids) associated with telomeres, where it is a substrate for tankyrase, which causes its release from telomeric DNA. It is also a component of the large ribonucleoprotein complexes known as **vaults**, where it is a substrate for V-PARP. It contains an N-terminal aspartate and glutamate-rich region, two nuclear localization signals, and a sequence strongly homologous to the DNA-binding repeats of MYB.

Ter *see reactivity of enzymes.*

tera+ *symbol:* T; SI prefix denoting 10^{12} times.

terato+ or (*before a vowel*) **terat+** *comb. form* denoting congenital abnormality.

teratocarcinoma a **teratoma** that includes carcinomatous cells.

teratogen a substance that produces malformations in embryos. —**teratogenic** *adj.*

teratoma a tumour composed of disorganized tissues that are foreign embryologically to the tissue normally found at the site. Teratomas most frequently occur in testis or ovary, and may be derived from remnants of multipotential embryological cells that can differentiate into many cell types.

TERM a family of F-actin binding proteins, named from **talim** and the related proteins **ezrin**, **radixin**, and **moesin**.

terminal amino acid the amino-acid residue at the end of a peptide or polypeptide chain. The **C-terminal amino acid** is the one that has a free α -carboxyl group (*see C terminus*); the **N-terminal amino acid** is the one that has a free α -amino group (*see N terminus*).

terminal deletion *see deletion.*

terminal deoxynucleotidyltransferase *abbr.:* TdT; EC 2.7.7.31; *recommended name:* DNA nucleotidyltransferase; *systematic name:* nucleoside-triphosphate:DNA deoxynucleotidyltransferase; *other names:* terminal transferase; terminal deoxyribonucleotidyltransferase. An enzyme, commonly isolated from calf thymus, that catalyses the successive transfer of deoxynucleotide residues from the corresponding nucleoside triphosphates to the 3' end of an oligo- or polydeoxynucleotide. It is a template-independent, Mg^{2+} -dependent **DNA polymerase**.

terminal oxidase an enzyme in a respiratory chain that transfers electrons from other carriers such as quinol or cytochrome c to oxygen, forming water..

terminal tip *an alternative name for leaf* (def. 3).

terminal transferase *see terminal deoxynucleotidyltransferase.*

terminal web the cortical network of **cytoskeleton** filaments under the plasma membrane. Actin filament bundles may be attached, and it contains a dense network of **spectrin** molecules.

termination codon or **terminator codon** any **codon** that signals the termination of a growing polypeptide chain. *See also amber codon, ochre codon, stop codon.*

termination factor any protein that participates in the termination of either transcription (*see rho protein*) or translation (*see release factor*).

terminator (of transcription) a DNA sequence lying just downstream of the coding segment of a gene that is recognized by RNA polymerase as a signal to stop synthesizing messenger RNA during **transcription**.

termolecular reaction *see molecularity.*

ternary consisting of three parts.

ternary complex any complex formed between three chemical entities, e.g. a complex formed between an enzyme and two substrate molecules.

terpene any lipid that consists of multiples of **isoprene** (C_5H_8) units. Terpenes may be acyclic, cyclic, or multicyclic, saturated or unsaturated, and can be substituted by various functional groups, e.g. OH. Terpenes containing 10, 15, 20, 30, 40, or more carbon atoms per molecule are known as **mono-**, **sesqui-**, **di-**, **tri-**, **tetra-**, or **polyterpenes** respectively. The class includes alcohol, aldehyde, and carboxylic acid derivatives of terpene hydrocarbons. Isoprene is the only naturally occurring **hemiterpene**, i.e. having five carbons, but the phosphorylated compounds Δ^2 - and Δ^3 -isopentenyl diphosphates are key intermediates in terpene biosynthesis. *See also polyprenyl.*

terpenoid 1 resembling a **terpene** in chemical structure. **2** any member of a class of compounds characterized by an isoprenoid chemical structure (as in a **terpene**) and often including their oxygenated and hydrogenated derivatives.

Terramycin a *proprietary name for oxytetracycline*.

tert- *abbr.:* t-; *prefix (in chemical nomenclature)* signifying **tertiary** (def. 1).

tertiary (*in chemistry*) **1** a *prefix:* *tert-* (*abbr.:* t-); describing an alkyl compound (e.g. an alcohol) in which the functional group (e.g. a hydroxyl group) is attached to a carbon atom linked to three others. **b** describing the carbon atom bearing the functional group in such a compound. **2** describing an amide or an amine in which three appropriate groups are attached to a nitrogen atom. **3** describing a salt formed by replacing all three of the ionizable hydrogen atoms of a tribasic acid by one, two, or three other cations of appropriate valency. *Compare primary, secondary.*

tertiary structure the level of protein structure at which an entire polypeptide chain has folded into a 3-D structure. The tertiary structure results from interactions between amino-acid residues that may be widely separated in the primary structure, but may be brought into proximity by the folding of the polypeptide chain. The forces of interaction between residues include hydrogen bonds and electrostatic attraction. The structure is stabilized in some proteins by disulfide bonds. In multichain proteins, the term tertiary structure applies to individual chains. *Compare primary structure, secondary structure, quaternary structure.*

Tes or **TES** *abbr. for N-tris(hydroxymethyl)methyl-2-aminoethanesulfonic acid;* 2-[2-hydroxy-1,1-bis(hydroxymethyl)ethyl]amino]-ethanesulfonic acid; a **Good buffer substance**; pK_a (20°C) = 7.5.

tesla *symbol:* T; the SI derived unit of **magnetic flux density**. It is equal to one weber of magnetic flux per square metre; i.e. $1\text{ T} = 1\text{ Wb m}^{-2}$. [After Nikola Tesla (1856–1943), Croatian-born US physicist.]

testes-specific poly(A) polymerase *abbr.:* TPAP; a cytoplasmic poly(A) polymerase (70 kDa) that is specific to testes, and is involved in poly(A) tail extension of mRNAs expressed by haploid-specific genes. Male mice that lack the enzyme are infertile because spermiogenesis is arrested at the rounded spermatid stage.

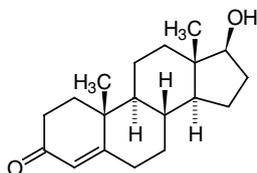

testican a multidomain glycoprotein of testes.

testicular of, or relating to, the **testis**.

testicular feminization or **testicular feminisation** an inherited condition in which genetic males have developmental abnormalities ranging from a complete external female phenotype to partially masculinized ambiguous genitalia. The commonest form is X-linked and results from any of several hundred mutations in the androgen receptor that impair its sensitivity to the hormone. An autosomal recessive form results from many mutations that produce steroid 5α -reductase 2 deficiency and lack of 5α -dihydrotestosterone (*see steroid 5α -reductase*).

testis (*pl. testes*) the male gonad; in vertebrates there is typically a pair of testes, producing spermatozoa and synthesizing **androgens**.

testosterone 4-androsten-17 β -ol-3-one; the principal and most potent androgen. It is formed from androstenedione by $3\alpha(17\beta)$ -hydroxysteroid dehydrogenase (NAD⁺) (EC 1.1.1.239), in Leydig cells of the testis. Testosterone is responsible during embryonic development for virilization, and promotes and maintains male secondary sex characteristics throughout life. It is also synthesized in the ovary from which some is secreted into the blood, but most is converted to estradiol. Its actions are in large part mediated by **dihydrotestosterone**, to which it is converted in target cells. *See also androgen receptor.*

testosterone

TetA a membrane-associated protein of Gram-negative bacteria that exports tetracycline from the bacterial cell thereby conferring antibiotic resistance. It is under the control of the **tetracycline repressor** (TetR). See **tetracycline resistant**.

tetanus 1 a disease resulting from infection with the bacterium *Clostridium tetani*. See also **tetanus toxin. 2** or **tetany** a sustained contraction of a muscle. —**tetanal** or **tetanoid** *adj.*

tetanus toxin the protein toxin of *Clostridium tetani*, the causative agent of tetanus. It is a heterodimer of light and heavy chains. It blocks neural exocytosis and thus norepinephrine release, possibly as a result of a Zn^{2+} -dependent proteolysis of **synaptobrevin** by the light chain, but also by inhibition of a neuronal transglutaminase (protein–glutamine γ -glutamyltransferase, EC 2.3.2.13). The protein is synthesized as a precursor of 1314 amino acids. This is cleaved to yield the light chain (residues 1–456) and heavy chain (residues 457–1314).

tetanus toxoid the **toxoid** prepared from *Clostridium tetani* toxin and included in anti-tetanus immunogens.

tetany *an alternative term for tetanus* (def. 2).

tetO 1 a 42 bp operator sequence from the tetracycline resistance operon of *E. coli* (Tn10). **2** a gene in Gram-negative bacteria encoding a tetracycline resistance protein that abolishes the effect of the antibiotic on protein synthesis.

Tet-Off *a proprietary name for a system for regulating the expression of transgenes in vivo by manipulating the concentration of tetracycline.* The gene of interest is placed downstream from **tetO** tetracycline response elements. The tetracycline *trans*-activator tTA (a fusion protein incorporating the N-terminal 1–203 amino acids of the **tetracycline repressor** protein TetR and the C-terminal 127 amino acids of the HSV VP16 activation domain) binds to tetO response elements and activates transcription. Addition of tetracycline or doxycycline causes dissociation of tTA from the operator thereby turning off transcription of the gene of interest.

Tet-On *a proprietary name for an adaptation of the Tet-Off system in which a modified trans-activator, rTA, binds to tetO sequences in the presence of doxycycline thereby activating transcription of the gene of interest.*

TetR *abbr. for tetracycline repressor.*

tetra+ or (*before a vowel*) **tetr+** *comb. form 1* denoting four, four-fold, every fourth; see also **tetrakis+** (def. 1). **2** (*in chemical nomenclature*) (*distinguish from tetrakis+* (def. 2)) **a** indicating the presence in a molecule of four identical specified unsubstituted groups; e.g. tetrachloroethylene, tetramethylammonium chloride. **b** indicating the presence in a molecule of four identical inorganic oxoacid residues in linear anhydride linkage; e.g. sodium tetraborate.

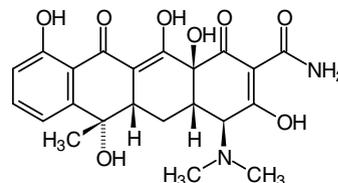

tetracos+ or (*before a vowel*) **tetracos+** *comb. form* indicating twenty-four.

tetracosactide or **tetracosactrin** or **cosyntropin** *generic names for* β^{1-24} -corticotropin, a synthetic polypeptide identical to the N-terminal 24 residues of **corticotropin**, and having all of its hormonal activity. It is sometimes known as 1–24 ACTH. Proprietary names include Synacthen.

tetracosapeptide a 24-residue peptide.

tetracycline 1 any of a group of broad-spectrum antibiotics that are also effective against rickettsial organisms, mycoplasmas, and certain protozoa. Their bacteriostatic activity depends on the direct inhibition of protein synthesis. They are active against pro-

tein synthesis on bacterial 70S or eukaryotic 80S ribosomes although 70S ribosomes are rather more sensitive. The tetracyclines are much more effective in intact bacteria than in eukaryotic cells because of selective absorption by bacterial cells. They inhibit the binding of aminoacyl-tRNA to the acceptor site on the ribosome. **2** any antibiotic based on the tetracycline nucleus (see **polyketide**). They include aureomycin (7-chlorotetracycline); terramycin (5-oxytetracycline); declomycin (6-demethyl-7-chlorotetracycline); doxycycline (6-deoxy-5-oxytetracycline). See also **tetracycline resistant**.

tetracycline repressor *abbr.:* TetR; a homodimer that binds to tandem DNA operators through N-terminal alpha helix-turn-alpha helix domains thereby blocking expression of the associated *tetA* gene and its own gene *tetR*. See **TetA**, **tetracycline resistant**.

tetracycline resistant *abbr.:* TC^r; resistant to the effects of the antibiotic **tetracycline**. Three different mechanisms of tetracycline resistance are known – tetracycline efflux, ribosome protection, and tetracycline modification – and over 60 tetracycline resistance genes have been sequenced. In enteric bacteria two **transposons**, Tn1721 and Tn10, commonly carry the genes for tetracycline resistance. Tn10 encodes two proteins: a membrane-located protein (TetA, M_r 36 000) that appears to mediate resistance and a repressor protein, TetR (see **tetracycline repressor**), associated with the inducibility of tetracycline resistance. The membrane protein pumps the tetracycline out of the cells against a concentration gradient. Foreign DNA may be fused to the tetracycline-resistance gene in a cloning vector thereby enabling bacterial clones containing the foreign DNA to be selected from those lacking resistance to the antibiotic. The plasmid pBR322 confers resistance to both tetracycline and ampicillin. Insertion of a foreign DNA at certain sites inactivates either or both genes.

tetracycline sensitive *abbr.:* TC^s; sensitive to the effects of **tetracycline**.

tetradeca+ or (*before a vowel*) **tetradec+** *comb. form* indicating fourteen.

tetradecadienoic acid any 14-carbon straight-chain fatty acid having two double bonds. Tetradeca-3*E*,5*Z*-dienoic acid (**megatonic acid**) and the (3*Z*,5*Z*)-isomer are sex attractants for *Attagenus megatoma* and for *A. elongatulus* respectively.

tetradecapeptide a 14-residue peptide.

tetradecenoic acid any 14-carbon monounsaturated fatty acid. Tetradec-9*Z*-enoic acid (**myristoleic acid**) is the most common naturally occurring form, but the 4*Z*-isomer occurs in tohaku oil and the 5*Z*-isomer (**physeteric acid**) in sperm-whale oil.

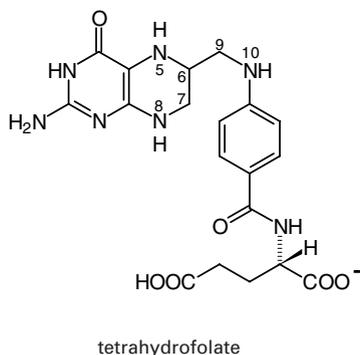

tetraenoic describing an acid having four double bonds. In long-chain fatty acids of the *n*-6 or *n*-3 families (see **fatty acid**), these will be **methylene-interrupted double bonds**.

tetragonal symmetry an arrangement, e.g. of a crystal or of ligands around a metal ion in solution, having a single fourfold axis of **symmetry**.

tetrahydro+ *comb. form* indicating the presence of four hydrogen atoms at positions of specific interest (in relation to the parent compound, or as specified by a locant).

tetrahydrobiopterin see **biopterin**.

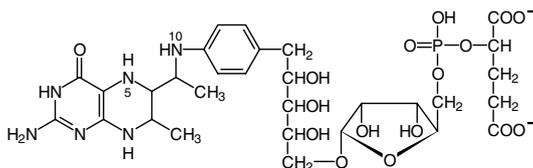

tetrahydrofolate *abbr.:* H₄folate or (not recommended) THF; N-[4-{{(2-amino-3,4,5,6,7,8-hexahydro-4-oxo-pteridin-6-yl)methyl}amino}benzoyl]-L-glutamate; folate bearing additional hydrogens at positions 5, 6, 7, and 8 of the pterin moiety. It is formed by the action of **dihydrofolate reductase** on dihydrofolate with NADPH as co-substrate.

tetrahydrofuran *abbr.*: THF; tetramethene oxide; an organic solvent that is useful for bringing into aqueous solution compounds that are otherwise sparingly soluble in water. It is a cyclic ether that is moderately soluble in water.

tetrahydromethanopterin *abbr.*: H₄MPT; a derivative of 7-methylpterin (2-amino-4-hydroxy-7-methylpteridine) that is involved in methane formation in **methanogenic** bacteria. It undergoes a series of interconversions involving N⁵ and N¹⁰, analogous to those of the **folate coenzymes**, with formation of formyl-H₄MPT, methenyl-H₄MPT, methylene-H₄MPT, and methyl-H₄MPT.

Tetrahymena a genus of ciliated protozoans, members of which are used in studies of ciliary axonemes, self-splicing RNA, and telomere reproduction.

tetrakis+ *prefix* 1 denoting four times, quadrupled; *see also* **tetra+** (def. 1). 2 (in *chemical nomenclature*) (*distinguish from* **tetra+** (def. 2)) **a** indicating the presence in a molecule of four identical specified groups each substituted in the same way; e.g. tetrakis(2-hydroxyethyl)ammonium chloride. **b** indicating the presence at separate positions in a molecule of four identical inorganic oxoacid residues; e.g. inositol 1,3,4,5-tetrakisphosphate.

tetrakisphosphate *see* **multiplying prefix**.

tetraoop a tetranucleotide **hairpin loop**.

tetramer a molecular complex having four components or subunits. If the subunits are identical, the term **homotetramer** is used; if any one is different from any other, the complex is called a **heterotetramer**.

tetraose tetrasaccharide; a stem name for any oligosaccharide consisting of four of the same residues per molecule in one type of linkage, as in cellotetraose. *Distinguish from* **+tetraose** and **tetrose**.

+tetraose *suffix* used to indicate a glycolipid containing an oligosaccharide moiety composed of four (identical or different) sugar residues, as in gangliotetraose. *Distinguish from* **tetraose**.

tetrapeptide a four-residue peptide.

tetraplex DNA or **quadruplex DNA** a four-stranded DNA structure

adopted by sequences rich in guanine bases. Two major classes are known. The first involves the folding back of a repetitive sequence of guanines resulting in antiparallel strands. The other is characterized by the association of four independent parallel strands. *See also* **triplex DNA**.

tetrapyrrole a structure found in **heme** and other **porphyrins**, **chlorophylls**, **bacteriochlorophylls**, **phytochromes**, **phycobilins**, and **corrionoids** (e.g. vitamin B₁₂). It consists of four pyrroles variously substituted and linked to each other through carbons at the α position; in the case of hemes, these links are formed by one-carbon units (methylidene group). Characteristically, a metal is found coordinated to the pyrrole nitrogens, including iron (in hemes), magnesium (in chlorophylls), copper (in **turacin**, the pigment of turaco bird feathers), and nickel (in **factor F₄₃₀**, a prosthetic group in methanogenic bacteria). Synthesis is via aminolevulinic acid, which is synthesized from glycine and succinyl-CoA in animals and nonphotosynthetic organisms by 5-aminolevulinic acid synthase. For further steps in the pathway, *see* **porphobilinogen synthase**, **hydroxymethylbilan synthase**, **uroporphyrinogen-III synthase**, and **uroporphyrinogen decarboxylase**.

tetraric acid an **aldaric acid** derived by oxidation of a **tetrose** at C-1 and C-4. There are three tetraric acids, D-, L-, and *meso*- **tartaric acids**.

tetrasaccharide an oligosaccharide with four **monosaccharide** units. **tetrasomic** describing any polysomic cell, tissue, or individual in which one chromosome is represented four times in an otherwise **diploid** chromosome complement. *Compare* **monosomic**, **nullisomic**, **trisomic**. — **tetrasomy** *n*.

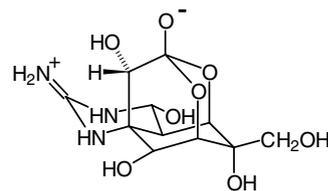

tetraspanin any of a family of integral membrane proteins that contain four transmembrane helices and have intracellular N- and C-termini. They contain <350 amino acid residues and occur mostly in vertebrates.

tetratricopeptide repeat *abbr.*: TPR; a degenerate consensus sequence of 34 amino acids found in multiple copies in several fungal and other proteins. These sequences participate in RNA synthesis regulation, protein import, and *Drosophila* development. Each sequence has two regions that are stereochemically complementary in α -helical conformation, and form a hole and a knob surrounded by hydrophobic residues.

tetrazolium salt any compound that is readily reduced to highly coloured, sparingly soluble formazan compounds. Tetrazolium salts are employed in the assay of some dehydrogenases, and include Blue Tetrazolium and Nitroblue Tetrazolium. **1H-tetrazole** is used in the chemical synthesis of oligonucleotides.

tetritol any alditol having a chain of four carbon atoms in the molecule.

tetrodotoxin *abbr.*: TTX; *also known as* **fugu toxin**; a toxin found in the liver and ovaries of the **fugu**, or puffer fish (order Tetraodontiformes, from which the toxin derives its name). It is a specific, reversible blocker of voltage-gated sodium channels, and can cause death by increasing paralysis. The LD₅₀ in mice is 8 $\mu\text{g kg}^{-1}$. It does not block potassium or chloride channels.

tetrose any aldose having a chain of four carbon atoms in the molecule. *Distinguish from* **tetraose**.

tetrolulose any ketose having a chain of four carbon atoms in the molecule.

T-even phage any one of the **bacteriophages** T2, T4, or T6 of *Escherichia coli*. These DNA phages share a number of morphological, biochemical, and other features that distinguish them as a

group from **T-odd phages** and are important historically in research on phages.

Texas Red a red-emitting fluorophore and a sulfonyl chloride derivative of sulforhodamine 101. It is used with **FITC** in dual-label flow microfluorimetric and fluorescent microscopic studies because its excitation and emission spectra do not overlap with those of fluorescein.

text mining the automated process by which large volumes of unstructured, natural-language text are analysed in order to pinpoint and extract user-specified information.

TF *abbr. for* **1** tissue factor. **2** transcription factor.

TFII any of a group of **transcription factors** for eukaryotic RNA polymerase II promoters. **TFIIA** is needed for **TFIID** binding. **TFIIB** binds to RNA polymerase. **TFIID** has two components, a TATA-binding protein that binds to the **TATA box**, and one of a number of accessory factors; it shows weak homology with bacterial **sigma factors**. **TFIIE** binds to RNA polymerase; it also shows weak homology with bacterial sigma factors. It is a tetramer of two α chains and two β chains.

TFIII any of a group of **transcription factors** for eukaryotic RNA polymerase III promoters. **TFIIIA** is a zinc-finger protein (*see* **zinc finger**) that binds both DNA and the 5S RNA transcript. **TFIIB** is an RNA polymerase-binding protein. **TFIIIC** (*or* **tau**) is a heterotrimer.

TFA *abbr. for* trifluoroacetic acid.

T form *abbr. for* tense form (*or* taut form).

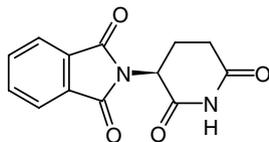

TG1 a derivative of the *E. coli* strain JM101 used for the propagation of bacteriophage M13 vectors.

TGF *abbr. for* transforming growth factor.

Th *symbol for* thorium.

thalassemia *or* (*esp. Brit*) **thalassaemia** any disease resulting from an inherited defect in the rate of synthesis of one of the types of globin subunits of **hemoglobin**. Such defects lead to ineffective erythropoiesis, hemolysis, and a variable degree of anemia. In **alpha thalassaemia** the defect is in the production of α globin and there is concomitant excessive β - and γ -globin production leading to the formation of various abnormal hemoglobins. In **beta thalassaemia** the formation of β globin is defective with an excessive synthesis of α globin and the continued production of fetal hemoglobin ($\alpha_2\gamma_2$).

thalidomide *N*-(2,6-dioxo-3-piperidyl)phthalimide; α -phthalimidoglutaramide; a synthetic tranquillizer and sedative. It was first used (in the 1950s) as a racemate, which causes severe fetal abnormalities such as the absence or shortening of one or more limbs. The *L*(*S*) enantiomer apparently has the teratogenic activity (*see* **teratogen**), while the *D*(*R*) enantiomer has the desired sedative property. The situation is unclear since thalidomide racemizes rapidly *in vivo*.

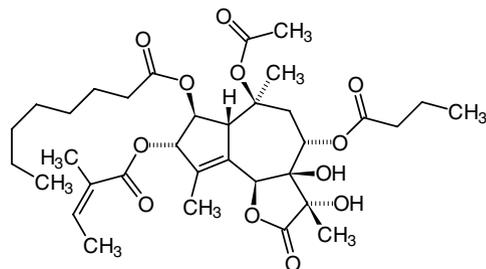

(*S*)-form

THAM *abbr. for* tris(hydroxymethyl)aminomethane; *see* **Tris**.

thanatogene a hypothetical gene whose expression is supposed to lead to cell death in terminally differentiated cells. [From Greek *thanatos*, death.]

thanatophoric dysplasia an autosomal dominant form of severe dwarfism that is usually lethal at or soon after infancy. It results from mutations in fibroblast growth factor receptor 3.

thapsigargin a tumour-promoting sesquiterpene lactone. It inhibits the calcium pump **SERCA** and increases cytosolic Ca^{2+} .

thapsigargin

thauMATIN a sweet-tasting, basic, 20 kDa protein isolated from the berries of the bushy African plant, *Thaumatococcus danielli*; there are five different forms. Its sweetness in aqueous solution is 2500 times greater than that of sucrose; it has sequence similarities with **monellin**.

Thd *symbol for* a residue of the ribonucleoside ribothymidine; ribosylthymine; thymine riboside (alternative to T). *Compare* **dThd**.

Thd5'P *symbol for* ribothymidine 5'-phosphate.

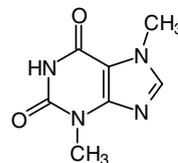

Thd5'PP *symbol for* ribothymidine 5'-diphosphate (alternative to ppT).

Thd5'PPP *symbol for* ribothymidine 5'-triphosphate (alternative to pppT).

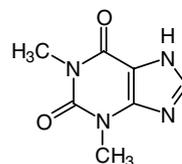

thebaine one of the alkaloids present in opium.

T-helper cell *see* **helper cell**.

theobromine 3,7-dimethylxanthine; the principal alkaloid of the cacao bean. Its actions are similar to those of **theophylline**. *See also* **caffeine**.

theophylline 1,3-dimethylxanthine; a competitive inhibitor of cyclic AMP phosphodiesterase. It has diuretic and cardiac stimulatory action, and relaxes smooth muscle; it is a bronchodilator. *See also* **caffeine**, **theobromine**.

Theorell-Chance mechanism (*in enzyme kinetics*) an enzyme mechanism in which it is obligatory for substrates to bind in a certain order and in which no kinetically significant ternary complex is formed. [After Axel Hugo Theodor Theorell (1903–82), Swedish biochemist, and Britton Chance (1913–), US biochemist.]

theoretical plate a term used in the analysis of chromatography column performance; the higher the number of theoretical plates achieved, the greater the efficiency of the column. The number of theoretical plates is derived by dividing the peak width by the retention time. The term derives from the concept that the column can notionally be divided into a large number of 'slices' or 'plates' at each of which the separation process will progress. *See also* **effective theoretical plate number**.

therapeutic index the ratio of **LD50** (median lethal dose) to **ED50** (median effective dose), used in quantitative comparison of drugs.

therm+ a variant form of **thermo+** (before a vowel).

thermal analysis see **differential thermal analysis**, **differential scanning calorimetry**.

thermal conductance symbol: G ; the ability of a material to conduct heat, measured as the ratio of the heat flow rate, Φ , to the temperature difference, i.e. $G = \Phi/\Delta T$. SI units are watts per kelvin.

thermal conductivity symbol: λ or k ; a measure of the ability of a material to transmit heat. It is the heat flux in W m^{-2} divided by the temperature gradient; i.e. $\lambda = J_q/(dT/dl)$, where J_q is the heat flux and dT is the thermodynamic temperature difference over the length, dl . It is measured in watts per metre per kelvin.

thermal denaturation profile a curve relating some physical property of a biopolymer in solution (e.g. viscosity, optical absorbance, or optical rotation) to temperature. The shape of the curve indicates the occurrence of physical changes in the biopolymer, e.g. separation of the two strands of double-stranded nucleic acid or alteration in the tertiary structure of a protein. See also **denaturation**, **melting temperature**.

thermal equilibrium the condition of a system when there is no tendency for heat to flow within it, or to or from its surroundings; all parts of the system and its surroundings are at the same temperature.

thermistor a semiconductor whose resistance is sensitive to temperature. [From thermal resistor.]

thermitase EC 3.4.21.66; other name: thermophilic *Streptomyces* serine protease; a Ca^{2+} -binding serine proteinase from *Thermoactinomyces vulgaris*, and a homologue of **subtilisin**. It is inhibited by *p*-mercuribenzoate, which reacts with the cysteine residue near the active-site histidine.

thermo+ or (before a vowel) **therm+** comb. form indicating a relationship to heat or heat transference.

thermobarometer a control manometer and flask used in a **Warburg apparatus**, or other constant-volume-type respirometer, to compensate for changes in temperature and barometric pressure during the course of an experiment.

thermochromism any reversible change of colour of a substance with change of temperature. Compare **electrochromism**, **photochromism**. —**thermochromic** *adj.*

thermocouple a device consisting of two pieces of dissimilar metals joined together at a point, their free ends being connected to an instrument to measure electromotive force (emf). The emf produced at the metal-metal junction is a function of the junction temperature, hence a thermocouple may be used to measure temperature. The phenomenon is known as the **Seebeck effect**.

thermodynamicase (sometimes) an alternative name for **protein disulfide isomerase**.

thermodynamic equilibrium constant see **equilibrium constant**.

thermodynamics the study of the laws that govern the conversion of energy from one form to another, the direction in which heat will flow from one system to another, and the availability of energy to do work. The **zeroth law of thermodynamics** states that if two systems are each in thermal equilibrium with a third system, then they must be in thermal equilibrium with each other. The **first law of thermodynamics** or the **law of conservation of energy** specifies that in an isolated, adiabatic system the sum of the internal energies of all kinds, U , remains constant, whatever may be the changes within the system itself. If a system of constant mass gains heat, q , and has work, w , done on it then a change in its internal energy, ΔU , occurs such that $\Delta U = q + w$. (Where the system loses heat, $q < 0$, and where work is done by it, $w < 0$.) The **second law of thermodynamics** is concerned with the restrictions in the direction of energy flow in natural systems and takes account of the irreversibility of natural processes. It specifies that the entropy of any system, S , unlike energy, is not conserved but increases with time in any spontaneous process in an isolated system. In the limiting case of a reversible process, the increase in entropy of a system, dS , is defined as the heat absorbed by the system, dq_{rev} , divided by the thermodynamic temperature, T ; i.e. $dS = dq_{\text{rev}}/T$. The **third law of thermodynamics** is concerned with the fact that the difference between the change in enthalpy, ΔH , and the change in the free energy, ΔG , of a system

diminishes as the temperature of the system diminishes, and the value of $(\Delta H - \Delta G)$ tends to zero as the thermodynamic temperature tends to zero. This requires that the change in the heat capacity of the system (at constant pressure), ΔC_p , and ΔS must fall to zero at 0 K.

thermodynamic temperature or (formerly) **absolute temperature** symbol: T ; a fundamental physical quantity – one of the seven SI base quantities – defined in terms of the laws of thermodynamics, independently of any particular substance. The SI unit is the **kelvin**. See also **temperature**.

thermogenesis the generation of heat by specialized tissues in mammals and in flowers or inflorescences of plants, e.g. arum lilies (*Arum maculatum*). In mammals, this function is performed by **brown adipose tissue**. —**thermogenic** *adj.*

thermogenin another name for **brown fat uncoupling protein**.

thermolabile unstable at elevated temperatures. Compare **thermostable**. —**thermolability** *n.*

thermolysin EC 3.4.24.27; other name: *Bacillus thermoproteolyticus* neutral proteinase; a heat-stable metalloendoproteinase produced by *B. thermoproteolyticus*; it contains four zinc and calcium ions. It catalyses the preferential cleavage: Xaa-|-Leu > Xaa-|-Phe.

thermolysis the cleavage of one or more covalent bonds caused by exposing a chemical compound to a raised temperature. See also **pyrolysis**. —**thermolytic** *adj.*

thermometer any instrument for measuring temperature. All thermometers depend on the change with temperature of some easily measured physical property such as the expansion of mercury (or other liquids) or the change in electrical resistance. See also **thermocouple**.

thermometry the branch of physics concerned with thermometers and the measurement of temperature.

thermoneutron activation an alternative name for **radioactivation**.

thermoosmosis the flow of solvent, especially water, across a membrane as a result of a temperature gradient across the membrane.

thermophile an organism, especially a microorganism, that can tolerate high temperatures and that grows optimally at temperatures above 45°C. Compare **mesophile**, **psychrophile**. —**thermophilic** *adj.*

thermoregulator any device or mechanism (including physiological) that controls the temperature of an environment. —**thermoregulatory** *adj.*

ThermoSequenase proprietary name for a DNA polymerase modified by protein engineering to have the thermal stability required for **cycle sequencing**.

thermospray or **electron spray mass spectrometer** (*abbr.*: ESMS); an instrument that directly applies a proportion of the eluent of a liquid chromatograph to a mass spectrometer for analysis of resolved components.

thermostable maintaining characteristics or function under a change (normally increased) of temperature. Compare **thermolabile**. —**thermostability** *adj.*

thermostat 1 an automatic device for regulating temperature, especially maintaining a constant temperature. Such devices often work by cutting off the supply of heat when the required temperature is exceeded and restoring it when the temperature falls below the required value. **2** to provide with or to control using a thermostat. —**thermostatic** *adj.*

thermotitration the determination of the endpoint of a reaction, or the point at which the reaction reaches equilibrium, by measurement of heat of reaction.

THESIT an alternative name for C_{12}E_9 (see **C_xE_y**), or Lubrol PX (see **Lubrol**).

theta symbol: θ (lower case) or Θ (upper case); the eighth letter of the Greek alphabet. For uses see **Appendix A**.

theta structure or **replication eye** or **replication bubble** the structure that forms during replication of circular duplex DNA by the opening up of the two strands. Under electron microscopy it looks like a Greek theta.

L-thevetose 6-deoxy-4-*O*-methyl-L-glucose; a component of some cardiac glycosides.

THF *abbr.* for **1** tetrahydrofuran. **2** tetrahydrofolate (H_4 folate preferred).

thia+ or (before a vowel) **thi+** *comb. form* containing sulfur, especially in place of carbon. See also **thio+**.

thiamine or (sometimes) **thiamin** or (formerly) **aneurin(e)** an alternative name for **vitamin B₁**.

thiamine diphosphate or (sometimes) **thiamin diphosphate** or (formerly) **thiamin pyrophosphate** *abbr.*: TPP; see **vitamin B₁**.

thick filament a longitudinal assembly of **myosin** molecules occurring in muscle. The thick filaments are the major constituents of the A band of the **sarcomere** in skeletal muscle; they interact with the **thin filaments** to bring about muscle contraction (see **sliding filament model**).

thimet oligopeptidase a thiol-activated metallopeptidase (78.5 kDa) that prefers substrates 6–17 residues long, and cleaves them 3–6 residues from the C-terminus. It is present in cytosol or vesicles, has a neutral pH optimum, and is inactivated by oxidation.

thin filament a molecular complex of **actin**, **troponin** (composed of troponins I, T, and C), and **tropomyosin**, found in muscle tissue. In striated muscle the thin filaments span the I band and interdigitate between the ends of the **thick filaments** in the A band. Interaction between the thin and thick filaments brings about muscle contraction (see **sliding filament model**).

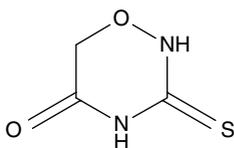

thin-film dialysis a type of **dialysis** that maintains the **diffusate** and the **retentate** in thin layers in intimate contact with the dialysis membrane in order to lessen the contribution to the overall rate of the process made by diffusion of solutes in free solution. Very rapid removal or exchange of small molecules can occur, especially if the volume ratio of diffusate to retentate is high. With appropriate membranes the technique may also be used for analytical studies of the size and conformation of peptides and proteins in solution.

thin-layer chromatography *abbr.*: TLC; chromatography on a thin layer of any of various powdered materials, including silicic acid, aluminium oxide, or cellulose. The layer, characteristically between 0.05 and 1 mm thick, is made to adhere to a sheet of glass, aluminium, or plastic. Thicker layers accept heavier loading, while thinner layers resolve more efficiently and rapidly. Resolving power is high, runs are rapid, and, because support materials such as silicic acid or aluminium oxide are inert to them, corrosive sprays, such as sulfuric acid, can be used to convert organic materials to carbon (a process known as charring), revealing them as black spots.

thio+ or (sometimes before a vowel) **thi+** *comb. form* 1 relating to or containing sulfur. 2 (in chemical nomenclature) denoting replacement of oxygen in a compound by (bivalent) sulfur. In trivial names of compounds it is used as a prefix (as in thiouracil; compare **uracil**), whereas in the systematic names of individual compounds it is used as an affix and is usually placed before the affix denoting an oxygen atom or an oxygen-containing group (as in ethanethiol; compare **ethanol**), although for organic sulfides, if named analogously to ethers by substitutive nomenclature, it replaces oxy+ (as in 3-(methylthio)propionate. Compare **thia+**. See also **mercapto+**).

thioacetal see **acetal**.

thiobarbituric acid 4,6-dihydroxy-2-mercaptopyrimidine. It reacts with aldehydes, particularly malondialdehyde, produced by oxidation of unsaturated fatty acids, to form a fluorescent red adduct.

thioctic acid a less common name for **lipoic acid**.

thiocyanate 1 the anion, N≡C–S⁻, derived from thiocyanic acid. 2 any salt of thiocyanic acid. 3 any organic compound containing the monovalent group –S–C≡N. Compare **isothiocyanate**.

thioester any organic compound formed, actually or formally, by the elimination of the elements of water either (1) between the carboxyl group of a carboxylic acid and a thiol, or (2) between the thiocarboxyl group of a thiocarboxylic acid and an alcohol or phenol. Thioesters formed by mechanism (1) are of general formula R¹–CO–SR², whereas those formed by mechanism (2) may be of general formula either R¹–CO–SR² or R¹–CS–OR².

thioether an old name for any organic sulfur-containing compound of general formula R¹–S–R². Sulfide is now the recommended generic name.

thiogalactoside transacetylase see **galactoside acetyltransferase**.

thioglycosidase EC 3.2.3.1; *systematic name*: thioglycoside glucohydrolase; *other name*: sinigrase. An enzyme that hydrolyses thioglycosides to the constituent thiol and sugar, e.g. sinigrin to glucose and *N*-(sulfoxy)-3-mercapto-3-butenimide.

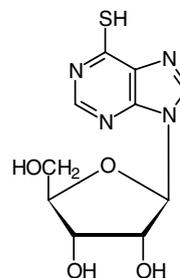

thioglycoside or **S-glycoside** any glycoside formed from a sugar and a thiol compound, e.g. **sinigrin**.

thiohemiacetal see **acetal**.

thiohemiketal see **acetal**.

thiohypoxanthine an alternative name for **mercaptapurine**.

thioinosine *symbol*: sI or Sno; 6-thioinosine; thiohypoxanthine riboside; mercaptapurine ribonucleoside; 9-β-D-ribofuranosyl-6-mercaptapurine; a synthetic nucleoside. See also **mercaptapurine**.

thioketal see **acetal**.

thiokinase any ATP-requiring enzyme of sub-subclass EC 6.2.1 (acid thiol ligases) that synthesizes CoA thioesters of various fatty acids. These enzymes (recommended names given first) are: (1) **acetate–CoA ligase**, which acts on acetate, propanoate, and propenoate; (2) **butyrate–CoA ligase**; EC 6.2.1.2; *other names*: fatty acid thiokinase (medium chain); butyryl-CoA synthetase; butanoate–CoA ligase (AMP forming); this acts on C₄ to C₁₁ acids and on corresponding 3-hydroxy- and 2,3- or 3,4-unsaturated acids; (3) **long-chain-fatty-acid–CoA ligase**; EC 6.2.1.3; *other names*: fatty acid thiokinase (long chain); acyl-CoA synthetase; acid:CoA ligase (AMP forming); this acts on a wide range of long-chain saturated fatty acids, depending on the tissue of origin of the enzyme; and (4) **acetate–CoA ligase (ADP-forming)**; also acts on propionate and (very slowly) on butanoate.

thiol 1 or (formerly) **mercaptan** any organic compound containing –SH as the principal group directly attached to a carbon atom. 2 or **sulphydryl** the (covalently linked) –SH group in any chemical compound.

+thiol suffix (in organic chemical nomenclature) indicating the presence of a **thiol** group attached to a carbon atom. Compare **mercapto+**.

thiolactomycin an antibiotic isolated from *Nocardia* spp. It selectively inhibits straight-chain fatty-acid syntheses of the multienzyme complex type (as in *E. coli*) but not the multicatalytic protein type (as in *Saccharomyces cerevisiae*).

thiolase a misleading generic name for certain enzymes of differing chain-length specificity within sub-subgroup EC 2.3.1 (acyltransferases) that catalyse the **thiolysis** by coenzyme A of CoA thioesters of β-oxo fatty acids according to the general equation:

Thiolases are thiol enzymes, their *S*-acyl derivatives being formed as intermediates in the reactions catalysed. Although the overall reactions are reversible, the equilibrium positions greatly favour cleavage. These enzymes include: **acetyl-CoA C-acetyltransferase** (EC 2.3.1.9) and **acetyl-CoA C-acyltransferase** (EC 2.3.1.16).

thiolate 1 the anion, R–S⁻, derived from a **thiol** (def. 1). 2 any salt of a thiol. 3 to introduce a thiol group into an organic compound.

—**thiolation** *n.*

thiol proteinase an old name for **cysteine endopeptidase**.

thioltransacetylase A see **dihydrolipoamide S-acetyltransferase**.

thiolysis lysis of a covalent organic compound by a thiol; a reaction analogous to **alcoholysis** in which bond cleavage is mediated by nucleophilic attack by the $-SH$ group of an alkanethiol. The term is applied to the **thiolase**-catalysed cleavage of a β -oxoacyl-CoA by coenzyme A in each turn of chain-length reduction during fatty-acid catabolism. —**thiolytic** *adj.*

thionein the apoprotein of a **metallothionein**.

thionin any of a group of small proteins, characterized by two conserved motifs, that occur in plants and are toxic to animals. The toxic principle of leaf thionin in barley is formed from residues 29–34 of a 137-amino-acid precursor. Thionins act by forming pores in the membranes of the affected organism. They are classified in the TC system under number 1.A.44.

thionucleoside any *N*-glycoside of any **thiopurine** or **thiopyrimidine**.

thionucleotide any phosphoric ester of any **thionucleoside**.

thiopurine any **purine** in which a thiol group has replaced a hydroxyl group. *Compare mercaptopurine.*

thiopyrimidine any **pyrimidine** in which a thiol group has replaced a hydroxyl group.

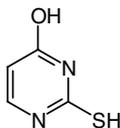

thioredoxin any of the widely occurring heat-stable hydrogen-carrier proteins of ≈ 12 kDa that serve as hydrogen donors in various reduction reactions, notably of ribonucleoside diphosphates to the deoxy analogues, and in the light-dependent reductive activation of various chloroplast enzymes (including several in the pentose-phosphate cycle). Chloroplast thioredoxin occurs in *f* and *m* forms, which show specificity in their enzyme-activating properties; a third form (designated *c*), of unknown function, occurs outside chloroplasts. Thioredoxins can exist in disulfide (i.e. oxidized) and dithiol (i.e. reduced) states, interconversion being catalysed by ferredoxin–thioredoxin reductases. *See also thioredoxin reductase (NADPH).*

thioredoxin reductase (NADPH) EC 1.6.4.5; a flavoprotein (FAD) enzyme that catalyses the reaction:

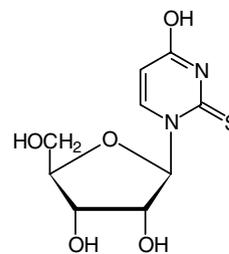

thiotemplate mechanism or **protein thiotemplate mechanism** the mechanism of biosynthesis of *Bacillus brevis* peptide antibiotics, e.g. **gramicidin S** and **tyrocidin A**, in which the precursor amino acids, after activation, are bound as thioesters to the synthetase enzymes.

thiouracil *symbol:* Sur; 2-thiouracil; 4-hydroxy-2-mercaptopyrimidine; 4-oxy-2-thiopyrimidine; a thiopyrimidine found in seeds of members of the cabbage family (e.g. *Brassica* spp.) and as a minor base in certain types of ribonucleic acid, especially transfer RNA (*see also thiouridine*). Thiouracil, 6-methylthiouracil, and 6-propylthiouracil are used to treat hyperthyroidism and thyrotoxicosis. They inhibit biosynthesis of the thyroid hormones at the peroxidase-catalysed iodination and coupling steps.

thiouridine *symbol:* S or sU or Srd; either of two constitutional isomers occurring as minor nucleosides in certain types of ribonucleic acid, especially transfer RNA (tRNA): **2-thiouridine** (2-thiouracil riboside; 1- β -D-ribofuranosyl-4-oxy-2-thiopyrimidine; *symbol:* 2S or s^2U), or its 5-methyl, 5-(methylaminomethyl), or 5-(methoxycarbonylmethyl) derivatives, which are found in some tRNA species in the first position of the anticodon; and **4-thiouridine** (4-thiouracil riboside; 1- β -D-ribofuranosyl-2-oxy-4-thiopyrimidine; *symbol:* 4S or s^4U), which is found in some tRNA species elsewhere than in the anticodon.

2-thiouridine

third law of thermodynamics *see thermodynamics.*

thixotrope a gel that exhibits **thixotropy**.

thixotropy the property shown by certain fluids and gels of becoming less viscous when subjected to stress, e.g. by shaking or stirring, and of becoming more viscous again when the stress is relieved. —**thixotropic** *adj.*

Thr *symbol* for a residue of the α -amino acid L-threonine (alternative to T).

THR a gene family encoding thyroid receptors; part of a superfamily including receptors for steroids, retinoic acid, and vitamin D₃; *see erba*.

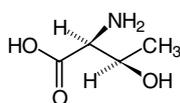

threading a fold-recognition method that identifies folds compatible with the sequences of proteins of unknown fold by threading the target sequence through template structures held in a reference library. In this process, the side chains are replaced and the main chain is kept constant, and the compatibility of the target with the template is estimated by means of pair potentials and solvation potentials. The approach is used when the target shows little or no similarity to any other sequence.

threitol active erythritol, *threo*-1,2,3,4-tetrahydroxybutane, *threo*-1,2,3,4-butanetetrol; an enantiomeric pair of polyols, configurationally isomeric with **erythritol**. D-Threitol occurs in certain fungi, e.g. the honey fungus, *Armillaria mellea*.

threo- a configurational prefix to the systematic name of a polyhydric alcohol, especially of a monosaccharide, used to indicate the particular stereochemical configuration of a set of two contiguous $>CHOH$ groups that occurs in D-threose (*see threose* for structure) or L-threose, e.g. D-*threo*-2-pentulose for D-xylulose. *Compare erythro-*

threoninate **1** threonine anion; the anion, $CH_3-CH(OH)-CH(NH_2)-COO^-$, derived from **threonine**. **2** any salt containing threonine anion. **3** any ester of threonine.

threonine the *trivial name* for α -amino- β -hydroxybutyric acid; (2*R**,3*S**)-2-amino-3-hydroxybutanoic acid; $CH_3-CH(OH)-CH(NH_2)-COOH$; an α -amino acid with two chiral centres. Because molecules of threonine possess a second chiral centre, at C-3, in addition to the chiral centre at C-2 common to all α -amino acids other than glycine, the enantiomers L-threonine, (2*S*,3*R*)-2-amino-3-hydroxybutanoic acid (*symbol:* T or Thr), and D-threonine, (2*R*,3*S*)-2-amino-3-hydroxybutanoic acid (*symbol:* D-Thr or DThr), are diastereoisomeric with those of **allothreonine**, (2*R**,3*R**)-2-amino-3-hydroxybutanoic acid. [*Note:* the enantiomers of threonine may also be named semi-systematically as derivatives of threose: L_s-threonine in amino-acid nomenclature is synonymous with 2-amino-2,4-dideoxy-D_g-threonic acid in carbohydrate nomenclature, and D_s-threonine with 2-amino-2,4-dideoxy-L_g-threonic acid (the subscript letters s or g being added to the configurational prefixes where there might be uncertainty regarding the reference centre of chirality; *see D/L convention*.)] L-Threonine is a coded amino acid found in peptide linkage in proteins; codon: ACA, ACC, ACG, or ACU. In mammals, it is an essential dietary amino acid, is glucogenic, and its deficiency causes fatty liver. The fungal toxins phalloidin and phalloin contain one residue of D-threonine per molecule.

L-threonine

threonine aldolase *see* glycine hydroxymethyltransferase.

threonine dehydratase EC 4.2.1.16; *systematic name*: L-threonine hydro-lyase (deaminating); *other names*: threonine deaminase; L-serine dehydratase; serine deaminase. A pyridoxal-phosphate enzyme that catalyses a reaction between L-threonine and water to form 2-oxobutanoate, NH_3 , and water; it acts also on L-serine. In *Escherichia coli* type 1 is responsible for the first step of isoleucine biosynthesis (serine is an alternative but poorer substrate); type 2 is a catabolic enzyme that acts on both serine and threonine, and is properly considered as a hydroxy-amino-acid deaminase.

threonine synthase EC 4.2.99.2; *systematic name*: O-phospho-L-homoserine phospho-lyase (adding water). A pyridoxal-phosphate enzyme that catalyses the formation of L-threonine from O-phospho-L-homoserine and water with release of orthophosphate. It shows sequence homology with the serine dehydratase/threonine dehydratase group.

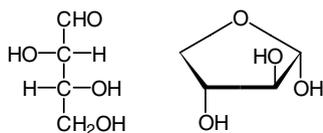

threoninium threonine cation; the cation, $\text{CH}_3\text{-CH(OH)-CH(NH}_3^+\text{)-COOH}$, derived from **threonine**.

threonino the alkylamino group, $\text{CH}_3\text{-CH(OH)-CH(COOH)-NH-}$, derived from **threonine**.

threonin-O²-yl the alkyloxy group, $\text{HOOC-CH(NH}_2\text{)-CH(CH}_3\text{)-O-}$, derived from **threonine**.

threonyl the acyl group, $\text{CH}_3\text{-CH(OH)-CH(NH}_2\text{)-CO-}$, derived from **threonine**.

threose the trivial name for the aldotetrose *threo*-tetrose; it has D and L enantiomers, which are respectively diastereoisomeric with those of erythrose. *See also threo*-.

 α -D-threose

threshold the value that must be achieved or exceeded for an effect to become discernible. For example, the **kidney threshold of excretion**, for any substance, is the plasma concentration at which not all of the substance that appears in the filtrate can be reabsorbed, so that it appears in the urine.

TRF *abbr.* for thyrotropic hormone releasing factor; i.e. **thyrotropin-releasing hormone**.

TRH *abbr.* for thyrotropic hormone releasing hormone; i.e. **thyrotropin-releasing hormone**.

thrombin EC 3.4.21.5; *other name*: fibrinogenase; a serine proteinase, M_r 33 700–33 900, the natural coagulant of **fibrinogen**. Thrombin appears in the blood following activation of the coagulation system, as a result of proteolysis of **prothrombin**. It catalyses the preferential cleavage of Arg-|-Gly, activating fibrinogen to **fibrin** and releasing fibrinopeptides A and B. Its effects are mediated by the **thrombin receptor**. *See also blood coagulation*.

thrombin receptor a protein of platelets and vascular endothelial cells that binds **thrombin** and mediates its intracellular effects. It is a G-protein-coupled receptor. The precursor of human thrombin receptor is a glycoprotein of 425 amino acids. The signal peptide comprises amino acids 1–26, and amino acids 27–41 are removed by thrombin, after which the new N terminus functions as a tethered ligand and the receptor is thereby activated.

thrombocyte an alternative name for **platelet**.

thrombogenic I tending to promote the formation of a blood clot

(i.e. a **thrombus**). **2** having a precursor function for, or tending to promote, the formation of **thrombin**.

β -thromboglobulin a protein (79 amino acids) derived from **platelet basic protein precursor** by removal of the first four N-terminal residues from **LA-PF4**. Released as a homotetramer into plasma by activated platelets, it mediates several actions in the inflammatory response, including chemotaxis of leukocytes. It is the precursor of NAP2 (68 amino acids).

thrombokinas an alternative name for factor Xa; *see blood coagulation*.

thrombolysis the degradation of a blood clot (i.e. **thrombus**) as a result of physiological or pharmacological action.

thrombolytic I tending to promote **thrombolysis**. **2** a drug or other substance promoting thrombolysis.

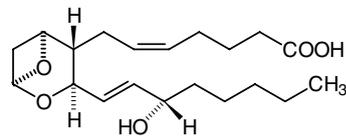

thrombomodulin *abbr.*: TM; *other name*: fetomodulin; a specific endothelial cell receptor that binds thrombin, the complex converting protein C to activated protein C. It is a type I membrane protein.

thrombophilia any tendency to intravascular thrombosis. The commonest form is resistance to activated **protein C** due to a mutation in blood coagulation factor V.

thromboplastin an alternative name for factor III; *see blood coagulation*.

thrombospondin or **glycoprotein G** a thrombin-sensitive major glycoprotein located in the alpha granules of human platelets. It is secreted on thrombin activation, and binds to the platelet membrane in the presence of Ca^{2+} . It is an adhesion molecule that mediates cell-cell and cell-matrix interactions, and can bind to fibrinogen, fibronectin, laminin, and type V collagen. It is a trimeric, disulfide-linked protein and contains three types of repeating amino-acid sequence: the first is 57 amino acids long and shares similarity with circumsporozoite protein from a malarial parasite; the second is 50–60 amino acids long and shares similarity with **epidermal growth factor**; the third occurs as a continuous eight-fold repeat of a 38-residue sequence; structural similarity with **calmodulin** indicates that these repeats constitute multiple calcium-binding sites.

thromboxane any of a class of **prostanoids** synthesized by **thromboxane-A synthase** (EC 5.3.99.5) from prostaglandin H (the product of prostaglandin-endoperoxide synthase) as thromboxane A (TXA). Depending on whether the substrate of the enzyme is dihomo-(6,9,12)-linolenate, arachidonate, or eicosa-5,8,11,14,17-pentaenoate, the product is TXA₁, TXA₂, or TXA₃ respectively. TXA₂ is the major thromboxane *in vivo*. It is synthesized in platelets when these are activated by other aggregatory compounds and strongly reinforces the aggregatory reaction. TXA₂ is converted in minutes to the inactive thromboxane B₂ (TXB₂) by addition of water across the endoperoxide. Oxidation of the 11-hydroxy group of TXB₂ to an oxo group yields 11-dehydro-thromboxane A₂, a major long-lived metabolite in human plasma, useful for measurement as an index of thromboxane production. Beta-oxidation of TXB₂ yields 2,3-dinor-thromboxane B₂, the major human urinary metabolite. **Dideoxy-epoxymethanoprostaglandin F_{2a}** is a stable analogue that mimics TXA₂.

TXA₂

thromboxane-A synthase EC 5.3.99.5; *other names*: thromboxane synthase; thromboxane synthetase (*abbr.*: TXS); an enzyme that catalyses the formation from (5Z,13E)-(15S)-9 α ,11 α -epidioxy-15-hydroxyprosta-5,13-dienoate of (5Z,13E)-(15S)-9 α ,11 α -epoxy-15-hydroxythromba-5,13-dienoate (**thromboxane A₂**). It is a heme-thiolate protein. 1-(7-carboxyheptyl)imidazole and benzylimidazole

inhibit thromboxane-A synthase, as does the drug U-63557A, sodium furegrelate.

thrombus (*pl.* thrombi) a blood clot forming within a blood vessel. Thrombus formation may occur as a normal response during physiological blood coagulation. It may also occur pathologically, triggered by **atheroma**, and is the immediate cause of ischemia in a heart attack. Thrombi may also form, especially in veins, at other times, e.g. after surgery, and if they reach the lungs cause pulmonary embolism.

Thunberg method an early method for detecting and estimating **dehydrogenases** from the rate and extent of decolorization of Methylene Blue in solution in the presence of enzyme and substrate. The apparatus, known as a **Thunberg tube**, is a stoppered glass tube (sometimes with a side-arm for addition of reagents) that may be evacuated through the stopper, and then sealed by a twist of the stopper. [After Torsten Ludvig Thunberg (1873–1952), Swedish physiological chemist.]

Thx *symbol* for a residue of the α -amino acid and thyroid hormone L-thyroxine (alternative to T₄).

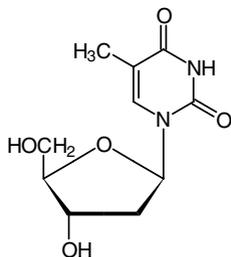

Thy *symbol* for a residue of the pyrimidine base thymine (alternative to T).

Thy-1 an allelic variable molecule, encoded on mouse chromosome 9, that is present on all T lymphocytes and also occurs in brain. It is a GPI-anchored membrane glycoprotein of the immunoglobulin superfamily, with a simple structure homologous to the **variable region** of an immunoglobulin molecule. *See also* **thymopoietin**.

thylakoid a saclike vesicle that bears the photosynthetic pigments in photosynthetic organisms. In prokaryotes the thylakoids are of various shapes and are attached to the plasma membrane. In eukaryotes they are flattened, membrane-bound disclike structures located in the **chloroplasts**; in higher plants they form dense stacks called **grana**. Isolated thylakoid preparations can carry out photosynthetic electron transport and the associated phosphorylation.

thymic hormones *see* **thymopoietin**, **thymosin**.

thymidine or **deoxyribosylthymine** *symbol*: dT or dThd; thymine 2'-deoxyriboside; 1-(2-deoxy- β -D-ribofuranosyl)-5-methyluracil; a deoxynucleoside very widely distributed almost entirely as phosphoric esters in deoxynucleotides and deoxyribonucleic acid, DNA. *Compare* **ribothymidine**. Because thymidine is absent from ribonucleic acid, the incorporation of radioisotope-labelled thymidine into cells is the basis of a procedure for measuring the rates of DNA synthesis and cell growth.

thymidine 5'-diphosphate *symbol*: dThd5'PP or ppdT; *the recommended name* for thymidine diphosphate (*abbr.*: dTDP), 5'-diphosphothymidine, 5'-thymidylyl phosphate, thymidine 5'-(trihydrogen diphosphate). It is an intermediate in the formation of thymidine 5'-triphosphate from thymidine 5'-phosphate. Derived compounds are the rare **nucleosidediphosphogars** thymidinediphosphorhamnose and its biosynthetic precursor thymidinediphosphoglucose.

thymidine kinase EC 2.7.1.21; *systematic name*: ATP:thymidine 5'-phosphotransferase; an enzyme that catalyses the phosphorylation of thymidine to thymidine 5'-phosphate. It acts on thymidine as a first step in its further metabolism. Mitochondrial and cytosolic forms are known, the latter being more active in proliferating than in resting cells.

thymidine monophosphate *abbr.*: dTMP; *an alternative name* for any **thymidine phosphate**, but in particular for thymidine 5'-phos-

phate, especially when its distinction from thymidine (5'-)diphosphate and thymidine (5'-)triphosphate requires emphasis.

thymidine phosphate *symbol*: dThdP; thymidine monophosphate (*abbr.*: dTMP); any phosphoric monoester or diester of thymidine. There are two monoesters – thymidine 3'-phosphate and **thymidine 5'-phosphate** – and one diester – thymidine 3',5'-phosphate – although thymidine 5'-phosphate is the ester commonly denoted (the locant being omitted if no ambiguity may arise). Thymidine 3'-phosphate (*symbol*: dThd3'P) (*or* thymidine 3'-monophosphate (*abbr.*: 3'dTMP) *or* 3'-thymidylic acid) is released from deoxyribonucleic acid by certain endo- or exonucleases, e.g. deoxyribonuclease II (EC 3.1.22.1) or spleen exonuclease (EC 3.1.16.1). The monophosphoric diester thymidine 3',5'-phosphate (*symbol*: dThd-3',5'-P) (*or* thymidine 3',5'-(cyclic)phosphate *or* cyclic thymidine 3',5'-monophosphate (*abbr.*: 3',5'-cyclic dTMP *or* cyclic dTMP *or* cdTMP)) is an intermediate during the acid hydrolysis of deoxyribonucleic acid.

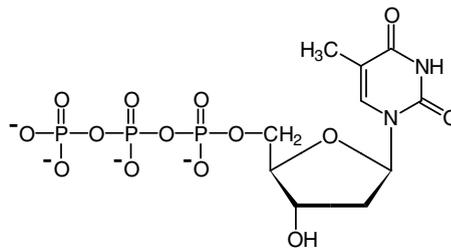

thymidine 3'-phosphate *see* **thymidine phosphate**.

thymidine 3',5'-phosphate *see* **thymidine phosphate**.

thymidine 5'-phosphate *or* 5'-thymidylic acid *or* 5'-phosphothymidine *or* 5'-O-phosphothymidine *symbol*: dThd5'P; *recommended names* for thymidine monophosphate (*abbr.*: dTMP), thymidine 5'-(dihydrogen phosphate), thymine (mono)deoxynucleotide. (The locant is commonly omitted if there is no ambiguity as to the position of phosphorylation.) It is synthesized (very indirectly) from **uridine 5'-phosphate**, its immediate precursor being 2'-deoxyuridine 5'-phosphate – *see* **thymidylate synthase**. Resynthesis of dTMP from free thymidine formed by degradation of DNA can also be effected via a **salvage pathway**.

thymidine phosphorylase *see* **pyrimidine-nucleoside phosphorylase**.

thymidine 5'-triphosphate *symbol*: dThd5'PPP *or* ppdT; *the recommended name* for thymidine triphosphate (*abbr.*: dTTP), 5'-triphosphothymidine, 5'-thymidylyl diphosphate, thymidine 5'-(tetrahydrogen triphosphate); a substrate for DNA synthesis. It is formed from thymidine 5'-phosphate by nucleoside-phosphate kinase (EC 2.7.4.4) and nucleoside-diphosphate kinase (EC 2.7.4.6), which transfer in turn the terminal phosphoric residues from two molecules of ATP.

thymidyl either of the chemical groups formed by the loss of a 3'- or a 5'-hydroxyl group from the deoxyribose moiety of thymidine.

thymidylyl **1** either the monoanion or the dianion of thymidylic acid. **2** any mixture of thymidylic acid and its anions. **3** any salt or ester of thymidylic acid.

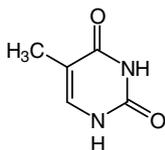

thymidylate synthase EC 2.1.1.45; *systematic name*: 5,10-methylenetetrahydrofolate:dUMP C-methyltransferase; an enzyme responsible for the formation of thymidylyl, dTMP, by the *de novo* pathway. It catalyses reductive methylation of 2'-deoxy-5'-uridylyl, dUMP, by reaction with 5,10-methylenetetrahydrofolate to form dihydrofolate and dTMP. Thymidylate synthase is a target for the antineoplastic agents **flurouracil** and fluorodeoxyuridine. These drugs are metabolized to fluorodeoxyuridylyl, which is a potent irreversible inhibitor of the enzyme. *See also* **thymineless death**.

thymidylic acid any phosphoric monoester of thymidine. The position of the phosphoric residue on the deoxyribose moiety of a given ester may be specified by a prefixed locant – *see* **thymidine phosphate**. However, 5'-thymidylic acid is the ester commonly denoted, its locant usually being omitted if no ambiguity may arise. 5'-Thymidylic acid is a recommended name for **thymidine 5'-phosphate**.

thymidyl the thymidine[mono]phospho group; the acyl group derived from **thymidylic acid**.

thymine a former name for **thymopoietin**.

thymine *symbol*: T or Thy; 5-methyluracil; 2,4-dihydroxy-5-methylpyrimidine; one of the two major pyrimidine bases present (as thymidine) in DNA but not in RNA other than (as ribothymidine) in transfer RNA, where it is a minor base.

thymine dimer a **pyrimidine dimer** formed within a DNA strand from two adjacent thymine residues by **photodimerization**. It is most commonly of the cyclobutadipyrimidine type.

thymineless death the death of an animal or bacterial cell following thymine (or thymidylate) deprivation. Such a deprived cell may continue to produce protein and RNA, but can no longer synthesize DNA in the absence of thymidylate. It eventually loses its vitality and dies, perhaps because it is also unable to repair altered or damaged DNA. The phenomenon may be demonstrated with a thymine-requiring auxotrophic bacterial mutant by omitting thymine from the medium, or with any cell by adding **fluorouracil** or its metabolite fluorodeoxyuridine, which inhibit **thymidylate synthase**. A rapidly metabolizing animal cell, such as a tumour cell, is particularly susceptible to thymineless death.

thymine deoxyriboside an alternative name for **thymidine**.

thymine riboside an alternative name for **ribothymidine**.

thymine a former name for 2-deoxy-D-ribose (see **deoxyribose**).

thymo+ *comb. form of*, or pertaining to, the thymus.

thymocyte any **lymphocyte** found in the thymus.

thymocyte mitogenic factor *abbr.*: TMF; an alternative name for **interleukin 2**.

thymocyte-stimulating factor *abbr.*: TSF; an alternative name for **interleukin 2**.

thymoma a tumour of thymic tissue.

thymonuclease another name for **deoxyribonuclease I**.

thymonucleic acid an alternative term for **thymus nucleic acid**.

thymopentin a synthetic pentapeptide that corresponds to residues 32–36 of **thymopoietin**.

thymopoietin *abbr.*: TP; *former name*: thymine; any one of three polypeptide hormones that result by alternative splicing of the same gene, and originally isolated from bovine thymus. They have pleiotropic actions on prothymocytes, inducing expression of the differentiation antigens such as **Thy-1**, and are important in T-cell development and function. They impair neuromuscular transmission after injection in mice, due to an effect on the nicotinic acetylcholine receptor. A synthetic pentapeptide corresponding to residues 32–36, named **thymopentin** and with the sequence Arg-Lys-Asp³⁴-Val-Tyr, has full activity. **Splenin**, a corresponding peptide in spleen, contains a similar pentapeptide, called **splenopentin**; bovine splenin has Glu in place of Asp³⁴, and human splenin has Ala in the corresponding position. These replacements affect the biological activity.

thymosin any of the polypeptide hormones of thymic origin that are involved in differentiation of T lymphocytes in the thymus. They include α_1 and β_4 thymosins, which are of known structure. Prothymosin- α is an oncoprotein that inhibits apoptosis by inhibiting formation of the complex (of seven molecules of Apaf-1 with seven of cytochrome *c*) that activates caspase 9. Thymosin β_4 (human, bovine, rat) has the sequence SDKPDMAEIEKFDKSKLKK-TETQEKNPSPKETIEQEKQAGES.

thymulin a zinc-requiring immunomodulatory thymic nonapeptide that induces T-cell differentiation. Its level is decreased in immunodeficiency and in autoimmune disease.

thymus a bilobed glandular organ located in the mediastinum in the anterior thorax. In mammals the thymus is encapsulated and divided into lobules, each consisting of cortex and medulla; the cortex consists mainly of lymphocytes (thymocytes). It is responsible for

populating the blood, lymph, and thymus-dependent areas with **T lymphocytes** during the neonatal period. Although large at birth it shrinks thereafter and may be difficult to identify in adults. It is important in **cell-mediated immunity**. —**thymic adj.**

thymus nucleic acid a former name for **deoxyribonucleic acid**, so called because the thymus was the first particularly rich source of a nucleic acid thought to be characteristic of animal tissues and distinct from that believed to be characteristic of plant tissues (called **yeast nucleic acid**).

thyro+ *comb. form of*, or pertaining to, the **thyroid gland**.

thyrocalcitonin *see* **calcitonin**.

thyroglobulin a protein in the **thyroid gland**, tyrosyl residues of which are modified to form the principal thyroid hormone, **thyroxine**, which is released by proteolysis. Thyroglobulin, a dimer of molecular mass ~660 kDa, is the main constituent of the so-called colloid of the thyroid follicles. Iodination of certain tyrosyl residues results in the formation of 3,5-iodotyrosyl residues; the iodinated phenolic moiety of one of these tyrosyls (in the free form, this would be a 2,6-iodophenyl group) is then transferred to the phenolic oxygen of another iodinated tyrosyl to form a tetraiodo compound; this is released by proteolysis as thyroxine (T_4) (some triiodo forms are also produced). The proteolysis occurs as colloid migrates from the basal to the apical surfaces of the thyroid cell. The colloid containing the modified thyroglobulin is taken into vesicles by phagocytosis to form periodic acid-Schiff positive (PAS) vesicles. Dense granules containing proteolytic enzymes then fuse with the vesicles to digest the thyroglobulin with the loss of PAS-positive material. The vesicles containing triiodothyronine and thyroxine are then extruded.

thyroidectomy the surgical removal of the thyroid gland.

thyroid gland a ductless gland of vertebrates, located near the larynx in most species, that secretes the hormones **thyroxine** and **triiodothyronine**. It contains closely packed follicles, or acini, each consisting of a sac that has a layer of cuboidal cells resting on an outer basement membrane. Each follicle is full of thyroglobulin-containing colloid. This is synthesized and secreted into the colloid space by the follicular cells; microvilli extend from the apical surface of the follicular cells into the colloid. In between the follicles are nests of parafollicular cells, or C cells, that synthesize **calcitonin**. Enlargement of the thyroid is called **goitre**. The thyroid concentrates iodide, a property that can be used for thyroid imaging, and for the treatment of cancer of the thyroid.

thyroid hormone either of the compounds secreted by the **thyroid gland**, namely **thyroxine** and **triiodothyronine**.

thyroid hormone receptor a receptor for **triiodothyronine** that belongs to the superfamily of eukaryotic transcription factors and the steroid/thyroid/retinoic acid family of nuclear receptors for hormones. There is a ligand-binding domain in the C-terminal region, a zinc-finger DNA-binding domain in the central region, and a function-modulating domain in the N-terminal region. Binding of hormone induces changes in conformation that control transcriptional activation and repression, and also regulates homo- or heterodimerization. In the absence of ligand, these receptors repress basal gene expression, probably through co-repressor proteins. Numerous mutations in the gene for the receptor result in resistance to thyroid hormone.

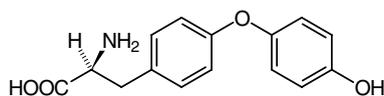

thyroid-hormone receptor-associated protein *see* **TRAP**.

thyroid response element *abbr.*: TRE; *see* **response element**.

thyroid-stimulating hormone *abbr.*: TSH; *recommended name*: thyrotropin; *other name*: thyrotropic hormone; a hormone, secreted by the adenohypophysis, that stimulates the activity of the thyroid gland. The bovine hormone is a glycoprotein (M_r 28 300) of α and β chains. The α chain has an amino-acid sequence identical with the α chain of **luteinizing hormone** and follicle-stimulating hormone. TSH increases uptake of iodide by the thyroid, the rate of conversion of diiodotyrosine to thyroxine, and the release of thyroid hormones. The release of TSH is influenced by **thyrotropin-releasing hormone**.

thyroliberin *recommended name for* **thyrotropin-releasing hormone**.

thyronine 4-(4-hydroxyphenoxy)phenylalanine; the notional parent structure of thyroid hormones (*see* **thyroglobulin**).

thyronine

thyroperoxidase a glycosylated integral membrane protein and enzyme of the apical surface of thyroid follicle cells, involved in the formation of thyroxine from thyroglobulin. It contains 933 amino acids and a transmembrane segment near the C-terminus. The N-terminal region contains the catalytic site and a heme moiety, and shares 42% sequence homology with myeloperoxidase. It catalyses the peroxidative iodination of specific tyrosine residues of thyroglobulin to monoiodotyrosine and diiodotyrosine, a process called **organification**. It also catalyses coupling of two of these diiodotyrosine residues to form thyroxine, a process called **coupling**. Both processes require the presence of hydrogen peroxide. Several mutations lead to congenital goitre and hypothyroidism due to the failure in organification.

thyrotoxicosis *see* hyperthyroidism.

thyrotroph a thyrotropic cell.

thyrotrophic having the effect of nourishing the thyroid gland, stimulating its growth and maintaining its size.

thyrotropic or (*esp. Brit.*) **thyrotrophic** having a modulating effect on the thyroid gland, especially in stimulating the synthesis of thyroid hormones. *See* **thyrotropin**.

thyrotropic hormone an alternative name for thyroid-stimulating hormone.

thyrotropic hormone releasing factor (*abbr.*: THR_F) or **thyrotropic hormone releasing hormone** (*abbr.*: THR_H) an alternative name for **thyrotropin-releasing hormone**.

thyrotropin the recommended name for thyroid-stimulating hormone.

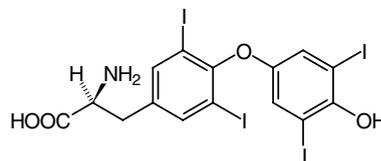

thyrotropin receptor a G-protein-associated membrane protein that binds thyrotropin (i.e. **thyroid-stimulating hormone**) and mediates its intracellular effects. Different forms are produced by alternative splicing. Mutations are associated with hyperfunctioning thyroid adenomas. The hyperthyroidism of **Graves' disease** results from autoantibodies that stimulate the thyroid through the thyrotropin receptor.

thyrotropin-releasing factor *abbr.*: TR_F; an alternative name for **thyrotropin-releasing hormone**.

thyrotropin-releasing hormone *abbr.*: TR_H; *recommended name*: thyroliberin; *other name*: thyrotropin-releasing factor (*abbr.*: TR_F); a hormone, released by the mammalian hypothalamus, that regulates the secretion of **thyroid-stimulating hormone** (TSH) by the adenohypophysis. It is present not only in primitive vertebrates but also in *Amphioxus* (a provertebrate) and in nerve ganglia of snails. It is the tripeptide pyroGlu-His-Pro-NH₂, the cyclized glutamate and prolylamide being essential for activity. The pyroGlu is derived from a glutamine residue in the precursor, with release of ammonia, and the C-terminal amine from a glycine residue in the precursor (*see* **C-terminal peptide amidation**). It is released from a polyprotein precursor that contains six copies of the tetrapeptide sequence required to generate the hormone. TRH occurs in other parts of the brain, in pancreatic islets, and in the gastrointestinal tract; it probably serves as a neurotransmitter or neuromodulator, being known in mammals to alter sleep patterns, increase motor activity and blood pressure, and affect norepinephrine turnover. *Other names*: thyrotropic hormone releasing factor (*abbr.*: THR_F); thyrotropic hormone releasing hormone (*abbr.*: THR_H).

thyroxine *abbr.*: Th_x or T₄; 4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenylalanine; 3,3',5,5'-tetraiodothyronine; the main hormone secreted by the thyroid gland, although its activity is lower than that of **triiodothyronine** (T₃). It is synthesized from L-tyrosyl residues of **thyroglobulin**. Thyroxine is essential for normal metabolism and physical development. It stimulates the metabolic rate, causing increased oxygen consumption and heat production in tis-

sues. Although in humans the plasma levels of T₄ are 20- to 50-fold higher than those of T₃, T₄ is converted to T₃ in tissues and the effects are mediated by T₃ binding to receptors in the cell nucleus, leading to mRNA and protein synthesis. The normal range in human blood is 60–150 nmol L⁻¹ (total of bound and free), 9–26 pmol L⁻¹ (free). The chemical constitution of thyroxine was deduced by the British biochemist Sir Charles R. Harington (1897–1972), and confirmed by synthesis (1927).

thyroxine-binding globulin *abbr.*: TBG; a major thyroid hormone transport protein found in mammalian serum. It is synthesized in liver, and variations in its concentration in serum result in similar variations in the level of circulating thyroid hormones. Alterations in its affinity for thyroid hormone also affect circulating thyroid hormone levels, decreased affinity being accompanied by decreased serum concentration. In the human, this variation may result from non-thyroidal illness, the presence of drugs (salicylates and phenytoin block thyroid-binding sites), or genetic variation, many variants being known.

Ti *symbol for* titanium.

TIC complex *abbr.* for peptide-translocating channel on inner chloroplast membrane; a protein complex of the inner chloroplast membrane that forms a peptide-translocating channel. The major component is TIC 110. *Compare* **TOC complex**.

tight coupling a term applied to mitochondrial function implying a high degree of efficiency in the yield of ATP (or other functional response) in relation to electron flow. The nearer the yield approaches the optimal value, the tighter the coupling is said to be. Tight coupling is obtained in isolated mitochondria only if gentle procedures, preserving membrane integrity, are employed during isolation. *See also* **chemiosmotic coupling hypothesis**, **phosphorus: oxygen ratio**.

tight junction or **zona occludens** (in vertebrate tissues) a beltlike region of very close contact between the plasma membranes of adjacent cells, such that the intercellular space is completely occluded. Tight junctions occur in epithelia and brain endothelia, and are effective barriers to the passage of water and solutes. *Compare* **gap junction**.

tight turn *see* **beta turn**.

TIGR *abbr.* for The Institute for Genome Research; *see* **sequencing centre**.

TIM *abbr.* for 1 triose-phosphate isomerase. **2** translocase of inner mitochondrial membrane; a protein complex that forms a channel in the inner mitochondrial membrane for proteins targeted for import into the organelle. It comprises four transmembrane proteins (Tim33, Tim23, Tim17, and Tim14) and a peripheral protein (Tim44). Tim23 and Tim17 contain 3–4 transmembrane segments each. The portion of Tim23 in the intermembrane space contains heptad repeats for coiled-coil formation and is sensitive to the electrochemical gradient across the inner membrane. TIM and TOM are believed to be apposed across the intermembrane space. *See also* **DPP**.

TIM barrel a protein structure in which 8 α/β segments form a barrel, as first described for **triose-phosphate isomerase**.

time *symbol*: *t*; one of the seven SI base physical quantities, usually indicating duration or a precise moment. The SI base unit of time is the **second**.

time constant a characteristic time taken by a system or a process to respond to a perturbation.

time course a graph plot of a parameter (that changes with time) scaled on the ordinate and time scaled on the abscissa.

time-of-flight mass spectrometer a type of **mass spectrometer** in which molecular ions from an ion source are ejected by a laser flash

or electrical pulse, and are separated by their speed of travel, which is inversely proportional to their **mass-to-charge ratio**.

time-resolved fluorescence a method in which a sample is irradiated using a laser delivering a short pulse of light, after which the exponential decay of fluorescence is measured using a photomultiplier. Lanthanides such as europium emit fluorescence over a period of microseconds and measurements can be made after the relatively short-lived autofluorescence of proteins has decayed. It is used as the basis of DELFIA. *See also* **steady-state fluorescence anisotropy**.

time-resolved fluorescence spectrometry a method in which a sample is irradiated using a laser delivering a short (sub-nanosecond) pulse of light, after which the exponential decay of fluorescence is measured using a photomultiplier. The sensitivity of detection must be at the single photon level ('single photon counting'), and fluorescence lifetimes as short as a few nanoseconds can be determined. However, a disadvantage of the technique is that many measurements over possibly several hours may be needed to obtain reliable and sufficient data. *See also* **steady-state fluorescence anisotropy**.

TIMP *abbr.* for tissue inhibitor of metalloproteases; any protein that inhibits metalloproteinases. TIMP-1, or EPA (erythroid potentiating activity), mediates erythropoiesis. It forms complexes with enzymes such as collagenases, bringing about irreversible inactivation. *See also* **matrix metalloproteinase**.

tintometer an apparatus formerly used for determining the colour of a solution by comparison with a graded colour scale.

tiny RNA *see* **miRNA**.

Ti plasmid *abbr.* for tumour-inducing plasmid; any large conjugative plasmid found in the soil bacterium *Agrobacterium tumefaciens* and responsible for **crown-gall disease** of broad-leaved plants – a segment of the Ti plasmid, the **T-DNA**, is found in the genome of the tumour tissue of affected plants. With appropriate modifications the Ti plasmid can carry foreign DNA sequences into the genome of a susceptible plant.

Tiselius apparatus an apparatus for performing **moving boundary electrophoresis** in which there is a U-tube with sliding joints. This enables the protein (or other) solution and the buffer to be placed in separate parts of the U-tube and sharp boundaries made between them when the parts are slid into position to complete the U-tube. [After Arne Wilhelm Kaurin Tiselius (1902–71), Swedish protein chemist.]

tissue any collection of cells that is organized to perform one or more specific function. *Compare* **organ**.

tissue culture 1 the technique or process of growing or maintaining tissue cells (**cell culture**), whole organs (**organ culture**), or parts of an organ, from an animal or plant, in artificial conditions. **2** any living material grown or maintained by such a technique.

tissue extract *an alternative name for* factor III; *see* **blood coagulation**.

tissue factor *abbr.*: TF; or factor III; a transmembrane glycoprotein, mainly of subendothelial cells, that initiates **blood coagulation** by forming a complex with factor VII or VIIA. The complex activates factors IX or X. In normal hemostasis tissue factor initiates cell-surface assembly and propagation of the coagulation protease cascade.

tissue grinder any device for disrupting tissue by a crushing or shearing action. The term may embrace devices ranging from a meat grinder (mincer), mechanical pestle and mortar, or mill, to the more precise **Potter-Elvehjem homogenizer** or the **Dounce homogenizer**.

tissue kallikrein *see* **kallikrein**.

titer *the US spelling of* **titre**.

titin or **connectin** a giant 521 kDa protein that forms a single molecule elastic filament, extending from the M line to the Z line in the striated muscle sarcomere, and is one of the largest polypeptides yet described. The sequence consists mainly of repeats of two types of ~100-amino-acid motifs (termed class I and class II) that share similarity with the fibronectin type-III domain and **immunoglobulin superfamily C2 domain**, respectively. There is also a domain characteristic of protein kinases near the C terminus. It is thought to play an important role in sarcomere alignment during muscle contraction. *See also* **twitchin**.

titratable acidity 1 a measure of the acidity of a urine sample, expressed as the volume of 0.1-M NaOH required to neutralize, usually to a phenolphthalein endpoint, a 24-hour volume of urine. **2** a measure of the acidity of any solution, etc.

titrate 1 to add acid of known concentration to base of unknown concentration (or vice versa) until the point of equivalence is reached, from which can be determined the concentration of the unknown. **2** more generally, to add any standard solution to an unknown until some detectable equivalence point is reached, enabling the amount of the unknown to be determined. **3** (*esp. in microbiology or immunology*) to determine the maximum dilution at which activity can be detected. *See* **titre** (def. 2). —**titratable** *adj.*; **titration** *n.*

titration curve originally, a curve relating pH to the equivalents of strong base added per equivalent of acid in the solution. Similar curves are obtained when the logarithm of ligand concentration is plotted against the degree of association (or dissociation) of a ligand to its acceptor, or when redox potential is plotted against the degree of oxidation (or reduction) of a redox system.

titration pK *symbol:* pG; a kind of **pK** that characterizes the titration curve of a multibasic acid. If this acid has n hydrons that titrate over the pH range of interest, then its titration curve is identical to that of an equimolar mixture of n (hypothetical) monobasic acids. The pK values of these acids are the titration pK values of the multibasic acid. They differ little from the **molecular pK** values if the differences between sequential molecular values exceed unity. *See also* **group pK**.

titre or (*esp. US*) **titer 1** a value found by titration; *see* **titrate** (def. 1, 2). **2** (*in microbiology and immunology*) a measure of the concentration or activity of an active substance, e.g. an antibody, in a solution, usually expressed as the highest dilution of the solution in which the activity can be detected. By convention, if the highest dilution giving activity is 100-fold, the titre is said to be 100.

titrimetry the technique of measurement by titration, particularly using instrumentation and automation.

Tl *symbol for* thallium.

TLC *abbr.* for thin-layer chromatography.

tld a gene in *Drosophila* for **Tolloid** protein, which is required for normal dorsal development. Mutations in *tld* lead to a partial transformation of dorsal ectoderm into ventral ectoderm.

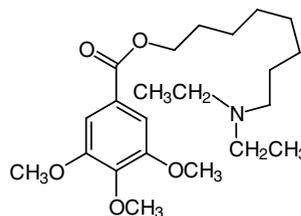

TLR *abbr.* for Toll-like receptor.

T lymphocyte or **T cell** any lymphocyte that undergoes maturation and differentiation in thymus. T lymphocytes are responsible for immune reactions involving cell-cell interaction, i.e. **cell-mediated immunity**. Subsets include: (1) cytotoxic T-lymphocytes, directly responsible *in vivo* for the death of cells identified for elimination; they include nonspecific killer cells (**NK cells**) and specific cytotoxic T-lymphocytes primed by antigen activation; (2) **helper cells**, which collaborate with **antigen-presenting cells** in the initiation of an immune response; and (3) **suppressor cells**, which down-regulate the response of helper cells.

Tm *symbol for* thulium. *Compare* **Tm**.

TMA *abbr.* for transcription-mediated amplification.

TMB-8 *abbr.* for (8-diethylamino)octyl-3,4,5-trimethoxybenzoate; an agonist that blocks intracellular Ca²⁺ channels.

TM domain *abbr.* for transmembrane domain.

TMF *abbr.* for thymocyte mitogenic factor; i.e. **interleukin 2**.

TMM *abbr.* for too many mouths; a protein (496 amino acids) of *Ara-bidopsis* that is expressed in proliferative postprotodermal cells and is thought to be a receptor. It contains a transmembrane segment at

the C-terminus and ten uninterrupted leucine-rich repeats in the central region. Mutations in the gene produce abnormal clusters of stomata on the leaf surface.

TMP *abbr. for* 1 ribosylthymine monophosphate or ribothymidine monophosphate, the common names for ribosylthymine 5'-phosphate, ribothymidine 5'-phosphate, 5'-ribothymidylyl phosphate, thymine riboside 5'-phosphate. 2 (sometimes) thymidine monophosphate. dTMP is recommended.

7TM *protein an alternative name for seven-transmembrane-domain protein.*

TM7 receptor or **TM7 protein** any plasma membrane receptor or other protein that contains seven transmembrane segments, each of 20–25 amino acids. Included are the family of G-protein associated membrane receptors and the **TRP channels**.

tmRNA *abbr. for* transfer-messenger RNA; *other names:* 10SaRNA; SsrA; a bacterial RNA (260–430 nt long, depending on species) that contains a tRNA domain that can be charged with an alanine residue at the 3' CCA end, and a short open reading frame (ORF) of nine codons. It binds at the A site of a ribosome that has stalled during translation because of some defect in the mRNA, adds its Ala to the nascent chain, then moves to the P site of the ribosome, the chain being transferred to the tmRNA (a process called **trans-translation**). Translation ends at the stop codon of the ORF, the defective protein being targeted for degradation.

TMR spectroscopy *abbr. for* topical magnetic resonance spectroscopy.

TMS *abbr. for* 1 tetramethylsilane; a water-soluble reference substance used in nuclear magnetic resonance spectroscopy. 2 the trimethylsilyl group; the symbol Me₃Si- is preferred.

TMV *abbr. for* tobacco mosaic virus, an RNA plant virus.

Tn *abbr. for* 1 troponin. 2 transposon.

TNBS *abbr. for* 2,4,6-trinitrobenzenesulfonate; a reagent that combines readily with amino groups. It may be used either to protect these groups or to introduce a chromophore. It is removable using hydrazine.

Tn-C *abbr. for* troponin C.

TNF *abbr. for* tumour necrosis factor.

TNF-α converting enzyme *abbr. TACE. other names* TNF-α convertase, ADAM-17; a member of the ADAM family of metalloproteases that cleaves the TNF-α precursor present in plasma membranes of activated macrophages and T cells to release soluble TNF-α, which is a cachectin.

TNF receptor-1-associated death-domain protein *see* TRADD.

TNF receptor-associated protein 2 *abbr.:* TRAF 2; an adaptor protein that is recruited by TRADD as part of the signalling complex that forms on the intracellular domain of tumour necrosis factor (TNF) receptor 1 following its binding by TNF. It recruits two inhibitor of apoptosis proteins (IAP1 and IAP2) that have ubiquitin-protein ligase activity. It may activate a protein kinase that activates the transcriptional activator JUN.

Tn-I *abbr. for* troponin I.

TNMR or **tmnr** *abbr. for* tritium nuclear magnetic resonance (spectroscopy).

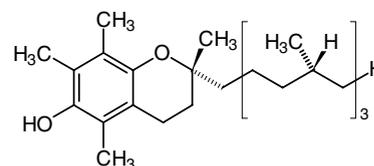

TNS *abbr. for* 2-p-toluidinylnaphthalene-6-sulfonate; a fluor used in **extrinsic fluorescence** studies of proteins.

Tn-T *abbr. for* troponin T.

tobacco acid pyrophosphatase an enzyme used for removing the 5' cap from mature mRNA by hydrolysis of the diphosphate bond.

TOC complex *abbr. for* peptide-translocating channel on outer chloroplast membrane; a protein complex of the outer chloroplast membrane that forms a peptide-translocating channel. The component is TOC 75. *Compare* TIC complex.

tocopherol a generic term for di- and trimethyltocols; α-tocopherol is 5,7,8-trimethyltocol, and is active as **vitamin E**; β-tocopherol is 5,8-dimethyltocol; γ-tocopherol is 7,8-dimethyltocol; and δ-tocopherol is 8-methyltocol.

α-tocopherol

T-odd phage any one of the **bacteriophages** T1, T3, T5, or T7 of *Escherichia coli* that share morphological, biochemical, and other features that distinguish them from **T-even phages**.

togavirus or (formerly) **arbovirus** any RNA animal virus consisting of an enveloped, icosahedral, 50–70 nm capsid with single-stranded infectious RNA (plus strand) of 4 MDa. Togaviruses include mosquito- and tick-borne viruses causing encephalitis and yellow fever.

tolaasin a channel-forming cyclic lipopeptide similar to **syringomycin**. It is produced by *Pseudomonas tolaasi* and causes the brown blotch disease of the cultivated mushroom *Agaricus bisporus*. It is classified in the TC system under number 1.D.4.

tolbutamide 1-butyl-3-(p-tolylsulfonyl)urea, *N*-[(butylamino) carbonyl]-4-methylbenzenesulfonamide; the prototype of sulfonylurea drugs, which exert a hypoglycemic action by stimulating release of insulin from the pancreas and are used to treat type II **diabetes mellitus**.

ToIC a homotimeric protein that forms a 12-stranded beta-barrel that spans the **outer membrane** of *E. coli* and has a long 12-stranded, mostly alpha-helical, barrel that extends far into the periplasm. It permits exit of large secreted proteins and of smaller toxic compounds. Each channel consists of a homotrimer, with each subunit containing 471 amino acids.

ToIC channel funnel a structure that functions to export substances out of the Gram negative bacteria by the Type I secretory pathway. It forms a contiguous channel with an inner membrane transporter, providing a direct pathway through the periplasm and outer membrane. ToIC channels eliminate a wide variety of toxic compounds and drugs.

tolerance 1 the progressive attenuation of the response to an agent (usually a drug) whereby increasing concentrations of the agent are required to maintain the response. Underlying mechanisms confer either functional (or pharmacodynamic) tolerance, where the loss of response is due to desensitization of effector mechanisms, or metabolic (or pharmacokinetic) tolerance, whereby elimination of the agent is accelerated usually by induction of catabolic enzymes or other inactivating mechanism. 2 the ability of an organism to grow and thrive in an unfavourable environment. 3 an allowable deviation from a standard. 4 **immunological tolerance**.

tolerogen an antigen that, in given circumstances, induces **immunological tolerance** when administered to an animal. Tolerogens may, when presented in different circumstances, induce an immune response. —**tolerogenic** *adj.*

Toll a developmental protein in *Drosophila melanogaster*, the product of *toll* gene, that is required for embryonic dorsal-ventral polarity. It is a type I transmembrane signalling receptor protein with a **leucine-rich repeat** segment.

Toll-like receptor *abbr.:* TLR; any of a family of receptors that are homologous to Toll of *Drosophila* and occur on leukocytes and epithelial cell surfaces. They recognize components of pathogenic microorganisms and trigger secretion of cytokines such as tumour necrosis factor and interleukins 6 and 8. About ten have been identified in humans. TLR2 binds bacterial peptidoglycan and lipoprotein; TLR4 binds Gram-negative lipopolysaccharides; TLR5 binds flagellin; and TLR9 binds the CpG motif of bacterial DNA.

tolloid a developmental protein in *Drosophila melanogaster* encoded by the *tlid* gene; it is a member of the **astatin** subfamily of metalloproteases.

tol plasmid a plasmid that specifies the degradation of aromatic hydrocarbons. *Pseudomonas putida* containing the pWWO plasmid

grows on toluene, *m*- and *p*-xylene, *m*-ethyltoluene, and 1,2,4-trimethylbenzene. Enzymes required for the metabolism of these compounds are encoded by the *xyI* operons.

TOM *abbr.* for translocase of outer mitochondrial membrane; a complex of transmembrane proteins in the outer mitochondrial membrane that consists of receptors for proteins targeted for import into the organelle and a general insertion pore (GIP). The receptors are the heterodimers Tom70–Tom37 and Tom22–Tom20. The GIP consists of multiple copies of Tom40, Tom7, Tom6, and Tom5. Tom40 is predicted to form a beta barrel, whereas all the others have one transmembrane segment each. The cytosolic parts of Tom70 and Tom20 contain tetratricopeptide repeats, which bind and bring their respective heterodimers together. This information is based on studies performed on the yeast complex. It is believed that TOM and TIM are apposed across the intermembrane space.

tomography a radiographic technique that can image a thin plane or section of a body. An X-ray beam is focused on an area of a body, the beam is then rotated, and successive images are stored and subsequently analysed by computer (**computer-assisted tomography**, or CAT scanning). **Positron emission tomography** (or PET scanning) involves the detection of X-rays emitted from radionuclides that decay by positron emission and are located within the patient's body, e.g. from ^{15}O (**oxygen-15**) after administration of H_2^{15}O .

ton 1 or (*esp. US*) **long ton** a unit of mass equal to 2240 pounds avoirdupois (1016.05 kg). **2** or (*esp. US*) **short ton** or **net ton** a unit of mass equal to 2000 pounds avoirdupois (907.18 kg). **3** metric ton; *see* **tonne**.

TonB-dependent transporter any 22-stranded beta-barrel transporter protein of the outer membrane of Gram-negative bacteria that is dependent for its function on contact with the TonB complex of the inner membrane. Examples are the ferric enterobactin receptor/transporter (FepA) and the ferrichrome receptor/transporter (FhuD), which permit entry of iron chelates and of vitamin B_{12} .

tone 1 (*in physiology*) or **tonus** the state of sustained partial tension adopted by muscles in order to maintain posture, etc. It is brought about by the contraction of only a certain proportion of the muscle fibres at any given time. **2** (*in clinical medicine*) the state or degree of firmness of a muscle on palpation.

tonicity 1 the **osmotic pressure** of a solution; often used in the sense of the ratio of the osmotic pressure of a solution to that of a given reference solution. **2** (of a muscle) the condition of possessing **tone** or tension. *See also* **hypertonic**, **hypotonic**, **isotonic**.

tonin EC 3.4.21.35; *other names*: esterase 1; S2 kallikrein; RGK-2; RSKG-5; a serine protease, present in several rat tissues, that can cleave angiotensinogen and angiotensin-tetradecapeptide renin substrate to produce angiotensin II directly. It also acts on the Phe-His bond of angiotensin I to form angiotensin II.

tonne or **metric ton** *symbol*: t; a unit of mass equal to 10^3 kg. 1 tonne = 0.984 207 UK ton or 1.102 31 short (US) tons.

tonometer 1 an apparatus, usually a closed glass vessel, used to equilibrate a liquid, especially blood, with a particular gas of known partial pressure. When equilibrium is established the phases are separated and the gas in question determined in both phases. **2** a device for measuring vapour pressure.

tonus *an alternative term for* **tone** (def. 1).

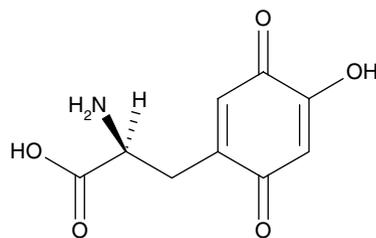

too many mouths *see* **TMM**.

tooth-lid factor a name originally given to **epidermal growth factor**.

top+ a variant form of **topo+** (before a vowel).

TOPA *abbr.* for 3,4,6-trioxyphenylalanine; 6-hydroxydopa. *See also* **TOPA-quinone**.

TOPA-quinone 3,4,6-trihydroxyphenylalanine quinone; 6-hydroxydopa quinone; the covalently bound redox prosthetic group of bovine plasma amine oxidase and some other copper-containing oxidases. It is formed by a post-translational modification involving hydroxylation of tyrosine contained in an active site with the consensus sequence, Asn-Tyr-Asp/Glu.

TOPA-quinone

topical relating to a particular place or part of the body; local; (of a medication, nutrient, etc.) applied locally rather than systemically. —**topically** *adv.*

topical magnetic resonance spectroscopy *abbr.*: TMR spectroscopy; a method for obtaining high-resolution **nuclear magnetic resonance** spectra from a selected place in a larger specimen (e.g. a specific organ of a living body). The sensitive volume is generated by superimposing high-order magnetic field gradients onto the main magnetic field of the spectrometer in such a manner as to define a central region of uniform field and adjustable size, surrounded by rapidly changing fields. Signals may be detected from individual nuclei, and the signals can be attributed to specific metabolites, enabling measurement of the level of these metabolites *in situ*.

topo+ or (*before a vowel*) **top+** *comb. form* denoting place or region. **topochemical 1** of, or pertaining to **topochemistry**. **2** of, pertaining to, or constituting a locally confined chemical reaction. **3** describing a combined tactile and chemical sense in some animals that is important in the perception of odours in relation to track or position.

topochemistry the characteristic chemical activity of a **topomer**.

topogenesis *an alternative term for* **morphogenesis**, especially in regard to biomolecular structures. —**topogenic** *adj.*

topogenic sequence any part of the sequence of a nascent polypeptide that is involved in getting the mature protein to its proper position in the cell. *See* **signal peptide**.

topogenic signal any feature of the structure of a macromolecule that directs it to a particular organelle in a cell. The term includes **topogenic sequence**. *See* **mannose 6-phosphate**.

topography 1 the science and practice of describing the arrangement in space of shapes and surfaces, and of components in relation to one another. **2** the detailed description, or representation on a map, diagram, etc., of the surface features of a three-dimensional object, or part of one, with reference to the underlying structure. *Compare* **topology**. —**topographic** or **topographical** *adj.*; **topographically** *adv.*

topoinhibition the inhibition of a cellular process by an action at the cell membrane, especially through contact with, or proximity to, other cells.

topoisomer or **topological isomer** any of two or more **isomers** of a macrocyclic molecule, or system of two or more macrocyclic molecules or molecular subunits, that differ in the degree of knotting of a loop or the degree of interlocking of rings. Topoisomers of a given molecule, or system of molecules, display the same connectivity, bond orders, and configurations but can be interconverted only by breaking and reforming a covalent bond; they have different **linking numbers**. *Compare* **topomer**. —**topoisomeric** *adj.*; **topoisomerism** *n.*

topoisomerase *see* **DNA topoisomerase**.

topological bond the force equivalent to a chemical bond that may be conceived as holding together any two interlocked rings of a catenated molecular structure or two loops of a knot in a cyclic molecule. Such a bond is the property not of a pair of atoms but of the complete molecule, the strength of the union being that of the weakest chemical bond in the entire structure.

topological isomer *an older name for* **topoisomer**.

topological isomerism *an alternative term for* topoisomerism; *see* **topoisomer**.

topological winding number *see* **supercoil**.

topology 1 (*in molecular biology*) the study of deformability and de-

formation of structures, including macromolecules. The basic concept is founded on whether a particular figure or surface can be continuously deformed without rupture and remaking of, e.g., a chemical bond. **2** (*in botany*) the study of localities where plants are found. **3** (*in mathematics*) the branch of geometry that deals with general types of shape rather than with particular shapes and sizes; the study of relationships that remain invariant under one-to-one transformation. *Compare* **topography**. —**topological** or **topologic** *adj.*; **topologically** *adv.*

topomer any of two or more **conformers** of a macromolecule that have differing **topography** (def. 2). Any topomer (or its exact mirror image) is characterized by a unique set of interactions between any two residues of the complete sequence of the macromolecule. *Compare* **topoisomer**.

topotactic describing a chemical reaction in which the product has an ordered geometric relationship to the reactant.

top yeast *see* **bottom yeast**.

torin or **calpromotin** a protein of human erythrocytes that forms a ten-subunit torus that interacts with the plasma membrane, with stomatin and with cyclophilin. Each subunit contains 198 amino acids.

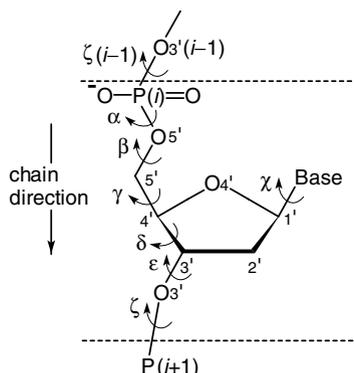

toroid 1 an alternative term for **torus**. **2** the solid enclosed by a torus. —**toroidal** *adj.*

torr *symbol:* torr; a non-SI unit of pressure, used especially in connection with low pressures. It is defined as equal to 1/760 of an atmosphere; i.e. 1 torr = 101 325/760 Pa = 133.322 Pa. Its use is now discouraged, in favour of the **pascal**. [After Evangelista Torricelli (1608–47), Italian physicist.]

torsin an AAA protease of the endoplasmic reticulum lumen. Mutation leads to autosomal dominant torsion dystonia.

torsion 1 the twisting of something about an axis by the application of equal and opposite rotational forces acting in parallel planes. **2** the twist so produced. —**torsional** *adj.*

torsion angle *symbol:* θ or ω ; consider an assembly of attached atoms represented by the generalized partial structure X–A–B–Y, where neither X nor Y is collinear with A and B, then the torsion angle is the smaller angle subtended by the bonds X–A and Y–B in a plane projection obtained by viewing the assembly along the axis A–B. Depending on the direction of rotation, right or left, of the bond to the furthestmost atom, Y, relative to the bond to the atom nearest the viewer, X, the angle is considered positive or negative, respectively. The multiplicity of the bonding of the various atoms is not relevant. A torsion angle may similarly be defined for a partial structure X–A–Z–B–Y where Z represents one or more additional atoms and A, Z, and B are collinear. The torsion angles for the backbone of a polypeptide chain are symbolized as follows: that for rotation about the N–C α bond is denoted by ϕ ; that for rotation about the C α –C' bond is denoted by ψ ; that for rotation about the C'–N bond is denoted by ω . The torsion angles for the backbone of a polynucleotide chain are as shown below. *See also* **conformation**, **Ramachandran plot**, **beta turn**.

designation of torsion angles for polynucleotides

torsion balance an instrument, used for the rapid weighing of small amounts of substances, in which the sample is balanced by the torsion of a wire and the amount of torsion that has to be applied to restore balance is indicated as a scale calibrated in units of mass.

torso a gene for a tyrosine kinase (EC 2.7.1.112) receptor in *Drosophila melanogaster*. The receptor is a type I membrane glycoprotein and is involved in the determination of anterior and posterior structures in the embryo.

torulin an obsolete name for extracts of yeast that cure polyneuritis in pigeons fed on a diet of polished rice, no doubt due to the vitamin B₁ content of yeast extract.

torus (*pl.* **tori**) a shape generated by rotating a circle or disk about an axis that is displaced outside the diameter of the circle or disk, but in the same plane; i.e. shaped like a ring doughnut (donut). *See also* **toroid**. —**toric** *adj.*

Tos *symbol* for the tosyl group.

tosyl *symbol:* Tos; a trivial name for the toluene-4-sulfonyl group, CH₃–C₆H₄–SO₂–, with which amino groups may be modified by allowing them to react with *p*-toluenesulfonyl chloride. *Compare* **pip-syl**.

total body water *abbr.:* TBW; *see* **body water**.

totipotent (of a cell) having the potentiality to develop in any way possible, given its particular genetic constitution, and thus to form a new organism or to regenerate any part of an organism.

touchdown PCR a variant of **polymerase chain reaction** (PCR) in which the annealing temperature is decreased by, say, 1°C every second cycle until a touchdown annealing temperature is reached for completion of the amplification. The advantage is that it enriches for products containing correct matches between primers and template, and minimizes spurious priming during amplification.

Tourette syndrome a relatively common autosomal dominant condition, characterized by chronic motor and vocal tics, that usually begins in childhood. Dopamine drugs enhance the symptoms, whereas certain dopamine receptor antagonists decrease them. The gene product responsible is unknown. [After Georges Gilles de la Tourette (1857–1904), French physician.]

toxic 1 poisonous. **2** of, relating to, or caused by a **toxin** or poison.

toxicity 1 the quality or state of being poisonous or toxic. **2** the relative degree of being poisonous or toxic; the potency of a **toxin**.

toxicogenic an alternative term for **toxigenic**.

toxicogenomics the analysis of the toxic effects of potential new drugs on gene expression patterns in target cells or tissues. It aims both to prioritize compound pipelines (to eliminate expensive failures in drug development), and to reveal genetic signatures that may predict toxicity in these compounds.

toxicology the science dealing with the effects of poisons on living organisms. The term is sometimes restricted to the effects of synthetic poisons and the term **toxinology** used when dealing with naturally occurring poisons.

toxic shock syndrome a syndrome of acute high fever, hypotension, diarrhoea, and a skin rash, that occurs in women usually during menstruation and with use of certain highly absorbent types of tampons. It is occasionally fatal, and is caused by infection from contamination by certain strains of *Staphylococcus aureus* that produce **toxic-shock syndrome toxin-1** (TSST-1).

toxic shock syndrome toxin-1 *abbr.:* TSST-1; a protein (193 amino acids) secreted by certain strains of *Staphylococcus aureus*, that is responsible for the **toxic shock syndrome**. It is a potent inducer of interleukins 1 and 2 and tumour necrosis factor.

toxify to poison; to render poisonous. —**toxification** *n.*

toxigenic or **toxicogenic** or **toxigenic** (especially of bacteria and fungi) producing toxin.

toxin any of various specific poisonous substances that are formed biologically. Not all such poisons are so termed, their classification as toxins being somewhat arbitrary and tending to vary with the discipline concerned; furthermore, the term is sometimes extended to include synthetic poisonous substances. Various types of toxin may be designated according to the source of the toxin, e.g. **endotoxin**, **exotoxin**, **mycotoxin**, **phycotoxin**, **phytotoxin**, and **zootoxin**, or according to the specific or prime site of action of the toxin, e.g. **hepatotoxin** and **neurotoxin**.

toxigenic an alternative term for **toxigenic**.

toxinology *see* toxicology.

toxoid an **exotoxin** that has been modified (e.g. by formalin treatment) so that its toxicity has been lost while its antigenicity (both immunogenicity and reactivity) is retained.

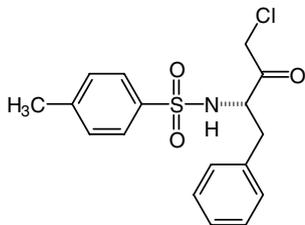

toxophore a term introduced by the German biochemist Paul Ehrlich (1854–1915) to denote the specific chemical group in a toxin molecule that is responsible for its toxic effect. Unlike the **haptophore**, it is destroyed on conversion of the toxin to a **toxoid**.

TP *abbr.* for thymopoietin.

TPA *abbr.* for 1 tissue-type plasminogen activator; *see* **plasminogen activator**. **2** 12-*O*-tetradecanoyl-phorbol-13-acetate (or phorbol 12-myristate 13-acetate; *see* **PMA**).

TPAP *abbr.* for testes-specific poly(A) polymerase.

TPCK *abbr.* for L-(1-tosylamido-2-phenyl)ethylchloromethyl ketone; a modifying reagent for histidine residues in peptidases such as trypsin.

T3 phage promoter a short DNA sequence recognized by the RNA polymerase from bacteriophage T3, e.g. -17 AATTAACCTCACTAAAGGAAGA +6.

T7 phage promoter a short DNA sequence recognized by the RNA polymerase from bacteriophage T7, e.g. -16 TATACGACTCACTATAGGGAGA +6.

TPI (formerly) *abbr.* for **1** triphosphoinositide; use PtdInsP₂ (or PIP₂) instead. **2** phosphatidylinositol 4,5-bisphosphate; use PtdIns-4,5-P₂ instead. *See* **phosphoinositide**.

TPN *abbr.* for triphosphopyridine nucleotide; obsolete, use **NADP⁺**.

TPNH *abbr.* for reduced triphosphopyridine nucleotide; obsolete, use **NADPH**.

TPP *abbr.* for thiamine diphosphate (formerly thiamin pyrophosphate); *see* **vitamin B₁**.

TPQ *abbr.* for topaquinone trioxyphenylalanine quinone; a quinone cofactor produced by post-translational modification of a tyrosyl residue in some quinoproteins.

TPR *abbr.* for tetratricopeptide repeat.

tpr-met an oncogene formed by the translocation of the *tpr* (translocated promoter) locus of chromosome 1 and *met* (the gene for **hepatocyte growth factor receptor**).

T protein *see* **glycine cleavage enzyme**.

tra symbol for **transformer**, a gene in *Drosophila*.

trace (in sequencing) a DNA sequence chromatogram that constitutes the primary data source for large-scale sequencing projects. Within the trace, coloured peaks represent each of the bases; the relative heights of the peaks determine which particular bases are read off to generate the raw nucleotide sequence.

tracee (in tracer kinetics) the non-radioactive compound of which the tracer is the radioactive equivalent; coined to represent unambiguously what has been variously called **stable material**, **mother substance**, etc. *Compare* **compartment**.

trace element or **microelement** any element that is present in the body of an organism at relatively minute concentrations (often arbitrarily defined as <0.005%), and consequently is required in the organism's diet in extremely small amounts. In higher animals the most important trace elements include: iron, zinc, copper, manganese, iodine, cobalt, molybdenum, selenium, and chromium. The extended list includes lead, arsenic, antimony, nickel, bromine, fluorine, boron, silicon, aluminium, silver, cadmium, bismuth, mercury, vanadium, titanium, indium, barium, strontium, and lithium. The term may be extended to cover elements of primarily toxicological interest.

trace metal any **trace element** that is a metal.

tracer an element or compound containing atoms that can be distinguished from their normal counterparts by physical means, e.g. by virtue of their radioactivity, mass spectrum, colour, etc. Tracers are used in biochemistry for following the metabolic pathways of substances in an organism, cell, or cell-free system.

track an individual lane resolving the components of a single sample on a slab electrophoresis gel.

tracking dye a dye that is added to a sample on an electrophoresis gel to be the fastest component and thus to indicate visually how far the samples have run at any instant in time.

TRADD *abbr.* for TNF receptor-1-associated death-domain protein; a cytosolic protein that interacts with tumour necrosis factor (TNF) receptor 1 after TNF binding and leads to activation of **NF-κB** and apoptosis. *See* **tumour necrosis factor receptor**.

TRAF 2 *abbr.* for TNF receptor-associated protein 2.

tragacanth 1 any thorny leguminous shrub of the genus *Astragalus*. **2** a gum obtained especially from *A. gummifer* and used extensively in commerce. It is a complex mixture of polysaccharides, including D-galacturonic acid, D-xylose, L-fucose, and D-galactose.

trailer sequence a sequence following the termination signal at the 3' end of **messenger RNA**.

training set a data set that is characteristic of, or encapsulates information on, the problem to be solved, and is used as input for learning algorithms, such as neural nets and hidden Markov models (HMMs).

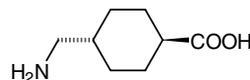

trait any observable, phenotypic feature of an individual.

TRAM or **TRAM protein** *abbr.* for translocating chain associating membrane protein; a transmembrane protein that spans the **rough endoplasmic reticulum** of mammalian cells, and plays a role in the translocation of nascent proteins destined for export from the endoplasmic reticulum.

TRAMP *abbr.* for tyrosine-rich acidic matrix protein; *other names*: 22 kDa extracellular matrix protein; dermatopontin; a protein of the extracellular matrix that may have various binding and adhesion functions.

TRANCE an alternative term for **RANKL**.

tranexamic acid *trans*-4-(aminomethyl)cyclohexanecarboxylic acid; it inhibits binding of plasminogen and plasmin to fibrin thereby inhibiting fibrinolysis.

trans+ or (sometimes before *s*-) **tran+** *comb. form* denoting across, beyond, on the other side, transverse; transfer, interchange. *See also* **trans-acting**.

trans- *abbr.*: *t*-; prefix (in chemical nomenclature) denoting a *trans*-isomer; *see* **cis-trans isomerism**.

trans-acting describing a regulatory genetic element whose effects are insensitive to its position. Examples include the genes for bacterial repressors. *Compare* **cis-acting**.

trans-activation gene activation by means of a **trans-acting** mechanism.

transacylase an older name for **acyltransferase**.

transaldolase EC 2.2.1.2; *other names*: dihydroxyacetone transferase, glycerontransferase; an enzyme of the pentose phosphate pathway that catalyses the transfer of a 3-carbon glycerone moiety from sedoheptulose 7-phosphate to glyceraldehyde 3-phosphate forming erythrose 4-phosphate and fructose 6-phosphate. It has a broad substrate specificity.

transamidation a chemical reaction in which the amino group of an amide is exchanged for another amino group, i.e.:

Transamidation is catalysed by such proteolytic enzymes as **trypsin**, **chymotrypsin**, **papain**, and **subtilisin**.

transamidination a chemical reaction, catalysed by a transaminidase (aminotransferase) enzyme of sub-subclass EC 2.1.4, in which the amidino moiety of arginine is reversibly transferred to an amino

group to form a different guanidino compound. An example is **glycine amidinotransferase**.

transaminase an alternative name for **aminotransferase**. See also **alanine transaminase**, **aspartate transaminase**, **transamination**.

transamination a chemical reaction, catalysed by any **aminotransferase** (transaminase) enzyme, in which the α -amino group of one amino acid is transferred to the α -carbon atom of an α -oxo acid. As a result, the α -oxo acid is transformed into an amino acid, and the amino acid that donated the amino group is converted to the corresponding α -oxo acid:

Transamination is important in the catabolism of amino acids, in which the amino group is eventually or directly transferred to oxaloacetate (to form aspartate) or to α -oxoglutarate (to form glutamate). If transferred to aspartate, the amino group enters the **urea cycle** at the argininosuccinate step; if transferred to glutamate, the amino group is removed by glutamate dehydrogenase, yielding ammonia, which then enters the urea cycle. Transamination is also involved in amino-acid synthesis. Pyridoxal phosphate is the coenzyme of aminotransferases. Transamination was discovered by the Russian biochemists Alexander Evseyevich Braunstein (1902–86) and Maria Grigorievna Kritzmann (1904–71).

transbilayer signifying across or through the membrane **lipid bilayer**, as in **transbilayer distribution**, transbilayer movement.

transbilayer distribution the distribution of components between the two leaflets of a membrane lipid bilayer, but often referring specifically to lipids. In the plasma membrane this distribution is asymmetric: phosphatidylcholine and sphingomyelin are relatively enriched in the outer leaflet, and phosphatidylethanolamine and phosphatidylserine are more predominant in the inner leaflet (i.e. the cytoplasmic face).

transcarboxylase 1 methylmalonyl-CoA carboxyltransferase; EC 2.1.3.1; *systematic name*: (S)-2-methyl-3-oxopropanoyl-CoA:pyruvate carboxyltransferase; a biotinyl-protein, containing cobalt and zinc, that is present in prokaryotes and catalyses the transfer of a carboxyl group from methylmalonyl-CoA [(S)-2-methyl-3-oxopropanoyl-CoA] to pyruvate forming oxaloacetate and propanoyl-CoA. **2** a component of the prokaryote form of **acetyl-CoA carboxylase** that transfers the carboxyl group from *N*-carboxybiotin to acetyl-CoA.

transcarboxylation the transfer of a carboxyl group from one compound to another, e.g. as catalysed by a **transcarboxylase**.

transcobalamin *abbr.*: TC; any of three plasma glycoproteins (TC I, TC II, and TCIII) that are secreted by the liver and bind cobalamin. TC II binds newly absorbed cobalamin and transports it to the tissues, where the complex binds a specific receptor, is endocytosed, and the cobalamin released in lysosomes. In the postabsorptive state most cobalamin is bound to TC I. Deficiency of TC II results in congenital macrocytic anemia, which progresses to include immunodeficiency and neurological complications.

transconjugant a bacterial cell that has received genetic material from another bacterium by **conjugation**. A transconjugant should be referred to as a **recombinant** only if the transferred genetic material has been inserted into a pre-existing **replicon** in the recipient. If the transferred material is perpetuated *per se* as a plasmid, then the cell is called a **plasmid transconjugant**. If such material is not a plasmid and does not become a resident replicon, it will fail to replicate; the bacterium will be called an **abortive transconjugant**.

transcortin a specific plasma α_1 -globulin, M_r 52 000, that binds **cortisol** at one binding site, and serves to transport the hormone. It also binds corticosterone and certain other steroid hormones; aldosterone is bound only weakly. Transcortin is synthesized in the liver. The normal serum concentration of transcortin is 3–4 mg dL⁻¹; saturation occurs at a cortisol serum concentration of about 28 μ g dL⁻¹, other cortisol being less tightly bound to albumin or (about 5%) unbound. *Other names*: corticosteroid-binding globulin; corticosteroid-binding protein; cortisol-binding globulin (*abbr.*: CBG); cortisol-binding protein.

transcribe 1 to copy. **2** to use DNA as a template for the synthesis

of mRNA, or, in some cases (e.g. as in retrovirus infection), to synthesize DNA from an RNA template. See **transcription**.

transcribing strand an alternative name for **noncoding strand** (of duplex DNA).

transcript the product of a **transcription** process; the **primary transcript** is the immediate product of an RNA polymerase.

transcriptase an alternative name for **DNA-dependent RNA polymerase**.

transcription the synthesis of either RNA on a template of DNA or DNA on a template of RNA. The latter is important in the replication of **retroviruses** by the enzyme **reverse transcriptase**. In the transcription of double-stranded (ds) DNA the RNA is formed on a template comprising only one strand, the transcribed strand. This is also called the antisense strand since the other strand is termed the sense strand. Transcription involves many steps. (1) The region of DNA to be transcribed must be unwound approximately one turn to form an open loop to allow the transcribed strand to form a DNA–RNA hybrid with the 3' end of the newly synthesized RNA. (2) The mRNA is transcribed by **RNA polymerase** from nucleoside triphosphates. The enzyme binds to the **promoter**, which is a region of DNA on the transcribed strand that has a characteristic base sequence (e.g. **TATA box**), usually located upstream of the start of transcription. However, in the case of eukaryotic RNA polymerase III, the promoter may sometimes be located downstream of the start point. In prokaryotes, for transcription to proceed, a complex must be formed on the dsDNA with the promoter and an accessory factor, **sigma factor**. In eukaryotes, an extensive and complex system of **transcription factors** regulates the process. While prokaryotes appear to utilize only a single RNA polymerase, eukaryotes possess three RNA polymerases; RNA polymerase I is located in the nucleolus and is responsible for the synthesis of ribosomal RNA. This polymerase accounts for the greatest quantity of RNA synthesized. RNA polymerase II is situated in the **nucleoplasm** and is responsible for the synthesis of heterogeneous nuclear RNA, for **primary transcript** from which messenger RNA is formed. This polymerase is thus instrumental in determining the nature of the protein profile of the cell. RNA polymerase III is also in the nucleoplasm and synthesizes transfer RNA. (3) In eukaryotes RNA polymerase II advances along the DNA template. The DNA unwinds ahead of the growing RNA and rewinds behind it thereby stripping the newly synthesized RNA from the transcribed strand of the DNA. The origin of the energy requirements for this movement is unclear. The movement is terminated by specific sequences in the transcribed DNA strand. In some cases **rho protein** plays a part in termination. (4) **Transcription factors**, which may be *cis-acting* or *trans-acting*, control transcription. In prokaryotes changes are very rapid since transcription and translation are tightly coupled. In eukaryotes such changes are slower. The activity of eukaryotic transcription factors is enhanced by proteins called **enhancers**, which may exert their influence over distances of several thousand base pairs. They may be **upstream**, **downstream**, or even in the midst of a transcribed gene. They may also be tissue specific. In the case of eukaryotes where the gene is split by **introns** the entire gene is transcribed and the introns are subsequently excised from the primary transcript by splicing.

transcriptional repressor any **transcription factor** (usually bacterial) that down-regulates gene expression by binding to an **operator**.

transcriptional silencing the repression of gene expression in a chromosomal region, which can span several or many genes. It can spread along a chromosome until insulator sequences are reached. Silencing can limit the expression of transgenes inserted into genomes randomly.

transcriptional territory any large group of adjacent genes that are expressed together but are not related by structure or function of their products.

transcriptional unit the segment of DNA within which the **transcription** occurs that eventually leads to RNA formation. *Compare* **cistron**, **gene**.

transcription elongation complex the complex of proteins required for elongation of the transcript during transcription in eukaryotes. It includes several transcription factors, RNA polymerase, elongin and other elongation factors, chromatin modelling complexes, and RNA processing proteins.

transcription factor *abbr.*: TF; any protein required to initiate or regulate **transcription**; the term includes **enhancers** as well as the general transcription factors. Transcription factors bind to DNA sequence elements upstream of the **start point** and thus participate in the formation of the complex that includes RNA polymerase and initiates transcription. *See, e.g.* **NF-KB**, **Oct**, **TFII**, **TFII**.

transcription initiation complex the complex of over 100 proteins (3.5 MDa) required for initiation of transcription in eukaryotes. It includes several transcription factors, RNA polymerase, Mediator, chromatin remodelling complexes, histone acetylases, and transcriptional activator proteins.

transcription in vitro *an alternative name for in vitro transcription.*

transcription-mediated amplification *abbr.*: TMA; a method for RNA amplification that uses RNA transcription by an RNA polymerase (such as T7 RNA polymerase) and DNA synthesis by reverse transcriptase to produce RNA transcripts from either DNA or RNA templates. It takes place under isothermal conditions and amplification of the order of 10^9 -fold is possible in less than 30 min. Oligonucleotide primers are specific for the target sequence at the 3' end and have a promoter for the RNA polymerase at the 5' end.

transcription start site *abbr.*: TSS; the location at the 5' end of a gene, adjacent to the **promoter**, at which the RNA polymerase complex binds to the DNA and initiates the process of transcription of that gene into mRNA. The precise context of the TSS depends on the gene, its host organism, the type of polymerase involved, and other factors. *Compare start point.*

transcriptome the entire set of mRNAs transcribed from a cell's genome. *Compare proteome.* –**transcriptomic** *adj.*

transcriptomics the study of transcriptomes, particularly how transcript patterns are affected by development, disease, or environmental factors such as hormones, drugs, etc. *Compare proteomics.*

transcytosis the transport of molecules across a cell, especially across a **polarized cell**, such as an intestinal epithelial cell, which has a basolateral and an apical membrane of different composition, which thus provides a spatially orientated transport system. The molecules undergoing transcytosis are usually contained within vesicles. One example is the absorption of maternal antibodies from the gut in newborn animals. The antibodies are taken into epithelial cells by endocytosis at the apical surface, and are transported through the cell before being released at the basal surface into the blood. Transcytosis also occurs in thyroid cells: following endocytosis from the thyroid follicle, thyroglobulin is transported across the cell in vesicles with concomitant proteolysis, with release of thyroid hormone into a blood capillary at the opposite face of the cell (*see thyroid gland*). —**transcytotic** *adj.*; **transcytose** *vb.*

transdeamination *a former term for the coupling of a transamidation reaction and the dehydrogenation of L-glutamate whereby an amino group of an amino acid is transferred to α -oxoglutarate by a transaminase enzyme and the resulting L-glutamate is dehydrogenated to yield α -oxoglutarate, ammonia, and a reduced coenzyme molecule.*

trans-dominant mutation a mutation in a regulatory gene that can control the expression of a structural gene on another chromosome.

transducer any device that converts a quantity of energy from one form into another.

transducin *abbr.*: G_T or G_G ; a heterotrimeric **G protein** of the retina, and a component in the visual transduction pathway. In the vertebrate light response, inactive heterotrimeric transducin with bound GDP ($G_{\alpha\beta\gamma}$:GDP) binds the photoactivated rhodopsin, metarhodopsin II, and releases GDP. GTP then binds to the α subunit, which then separates from both the receptor and the $\beta\gamma$ heterodimer. G_{α} then activates cyclic GMP phosphodiesterase, and the resulting fall in cyclic GMP concentration closes cyclic GMP-gated cation channels and hyperpolarizes the retinal rod cell, generating the nerve impulse.

transducon any large protein complex that contains components of a signalling cascade anchored to one or more scaffold proteins.

transduction 1 (*in microbiology*) the transfer of genetic information to a bacterium from a bacteriophage or between bacterial or yeast cells mediated by a phage vector. In **generalized transduction**

any of the donor genes may be transduced, whereas in **specialized transduction**, i.e. by a **lysogenic** bacteriophage, only those genes at one of the ends of the prophage can be transduced. **Abortive transduction** occurs when phage DNA is not incorporated into the bacterial genome, but can nevertheless be transmitted in the phage to one of the daughter cells. **2** (*in biochemistry*) the activation of an intracellular effector pathway as a result of receptor activation by an extracellular signal. *See also second messenger, signal transduction.*

transesterification a chemical reaction in which the alcohol moiety of an ester is exchanged for another alcohol:

It is catalysed by such proteolytic enzymes as trypsin, chymotrypsin, papain, and subtilisin, and by esterases.

trans-fatty acid any fatty acid that contains ethylenic bonds in the *E* configuration (i.e. *trans*). They can occur as the result of biohydrogenation in ruminant animals (cows, sheep, and goats) or during partial hydrogenation/isomerization of unsaturated fats (both vegetable and animal) to harden fats. Because of the association with risk of heart disease, the levels of *trans* fatty acids in margarines are kept to a minimum (at least in the UK and Denmark). The reasons why *trans* fatty acids are associated with increased risk of heart disease is uncertain – they lower HDL cholesterol compared with the corresponding *cis*-isomers, but not compared with carbohydrate.

transfection originally the process of infection of competent bacterial cells by free bacteriophage or plasmid nucleic acid that results in the subsequent production of normal bacteriophage or plasmids in the infected bacterial cell. It has come to mean the process of bringing about genetic alteration of any cell or organism using recombinant DNA technology.

transferase an enzyme that catalyses the transfer of a group – e.g. a methyl group, glycosyl group, acyl group, or phosphorus-containing group – from one compound (the donor) to another compound (the acceptor). Transferases, of which there are many, are EC class 2 enzymes.

transference number or **transport number** *symbol*: *t*; the fraction of the current being carried by a given type of ion when an electric current is passing through an electrolytic solution.

transfer factor a **lymphokine** extractable from leukocytes and thought to transfer the ability to elicit a **delayed hypersensitivity** reaction from one person or animal to another.

transfer gene any gene carried by a **conjugative plasmid** that is responsible for the donor phenotype.

transfer membrane a membrane used with **blotting** techniques in recombinant DNA technology or protein studies. Materials of interest are transferred from an electrophoretic gel to the transfer membrane either by capillary attraction or by using an electric potential (**electroelution**). Transfer membranes are of three types: (1) nitrocellulose – mixed esters of cellulose acetate and cellulose nitrate; high cellulose nitrate improves binding of biomolecules while a low percentage of cellulose acetate improves handling properties; nucleic acids can be fixed to nitrocellulose membranes by baking; (2) nylon, which is physically more robust and reusable, and to which nucleic acids can be fixed by exposure to ultraviolet light; or (3) polyvinylidene-based membranes.

transfer-messenger RNA *see tmRNA.*

transfer potential *another name for group transfer potential.*

transfer reaction *another name for group transfer reaction.*

transferrin any of a class of monomeric, two-domain (76–81 kDa), metal-binding glycoproteins, widely distributed in physiological fluids and cells of vertebrates, with the characteristic property of a stringent association of their metal-combining properties with an anion-binding requirement; iron-binding transport proteins that bind two Fe^{3+} in association with bicarbonate (or other anion). They are an essential component in cell culture media, transporting iron into cells through the **transferrin receptor**. The transferrin family includes proteins such as **lactoferrin**, **melanotransferrin** (with electrophoretic polymorphisms), **ovotransferrin** (*see conalbumin*) and **serotransferrin** (*other names*: siderophilin; β -1-metal binding globulin).

transferrinjection a method of gene transfer in which DNA com-

plexed to transferrin–polycation conjugates is introduced into cells by receptor-mediated endocytosis.

transferrin receptor a type I transmembrane glycoprotein of the plasma membrane that, on binding transferrin, undergoes endocytosis for transfer of Fe^{3+} ions into the cell. It consists of two identical single-pass subunits joined extracellularly by a disulfide bond. The intracellular domain is phosphorylated and palmitoylated, i.e. acylated with a palmitoyl group by a process analogous to **myristoylation**. Synthesis of the receptor is regulated by binding of aconitase to mRNA when intracellular iron concentrations are low, stimulating receptor synthesis, possibly by stabilizing the mRNA.

transfer RNA *abbr.*: tRNA; *other names*: acceptor RNA; amino-acid-accepting RNA; (*formerly*) soluble RNA (*abbr.*: S-RNA or sRNA). Any relatively small RNA molecule (73–93 nt) that mediates the insertion of an amino acid at the correct point in the sequence of a nascent polypeptide during protein synthesis. The amino-acid residue is attached by ester link to the adenosine of a CCA sequence at the 3' terminal of tRNA at either the 2'- or 3'-OH on the ribose. Specific tRNA molecules are present for the various amino acids. The amino acid is attached by a specific amino acid–tRNA ligase, which first forms an aminoacyl-adenylate, and then transfers the aminoacyl group to the tRNA. Each tRNA possesses an **anticodon** of three nucleotides that base pairs in an antiparallel fashion with the codons of mRNA. There are 61 sense codons but only about 41 different tRNAs in the cytoplasm and even fewer in mitochondria due to flexibility in the base pairing between codon and anticodon (*see wobble hypothesis*). The sequence of tRNA for phenylalanine – determined by US biochemist Robert Holley (1922–93) – indicated a clover-leaf secondary structure and the anticodon to be on a loop lacking base pairing. The tertiary structures that have been determined for tRNAs have supported the clover-leaf structure. tRNA is characterized by the presence of many unusual **minor bases** whose function has not been completely established. *See also initiator transfer RNA, suppressor tRNA.*

transform 1 to bring about **transformation**. **2** (*in mathematics*) a a process for deriving one mathematical entity from another. **b** the transformed entity itself.

transformant a bacterial cell that has undergone **transformation** (def. 1), i.e. one that contains integrated donor genes that can be detected by plating on media selective for some or all of the donor genes.

transformation 1 or **genetic transformation** the intraspecific and interspecific transfer of genetic information by means of 'naked' extracellular DNA in bacteria. In transformation, in contrast to **transduction**, the DNA not integrated into the recipient's genome cannot function and manifest its genetic information phenotypically. **2** characteristic and inherited changes produced in cells in culture when they have been treated with certain viruses (which may be DNA- or RNA-containing), or with chemical carcinogens, or with X-rays, or when they have been subjected to genetic modification by DNA technology. In animal cells, these changes include certain specific alterations in morphology (especially of the nucleus) and stainability, and the cells usually show a loss of **contact inhibition** and can give rise to neoplastic growth on injection into animals. The term also refers to corresponding changes occurring in cells *in vivo*. **3** or **blast transformation** or **lymphocyte transformation** the morphological and other changes that occur in both B and T lymphocytes when they are cultured in the presence of an antigen to which they are primed, or that occur nonspecifically in B lymphocytes when they are exposed to a mitogen (e.g. certain lectins). The lymphocytes increase in size and develop a basophilic ribosome-rich cytoplasm, a prominent nucleolus, and a paler-staining nucleus. After about three days these cells resemble **blast cells**. **4** the alteration produced in certain specific hormone-receptor proteins, present in the extranuclear region of hormone-responsive cells, when the hormone binds to them. This alteration is accompanied by the migration of the hormone–receptor complexes to the nucleus. **5** or **nuclear transformation** (of an atomic nucleus) the change of one **nucleide** to another.

transformer *symbol*: *tra*; a gene in *Drosophila* that is required for all aspects of female somatic sexual differentiation. Binding of the female SXL protein to the transformer pre-mRNA transcript results in splicing to remove exon 2, which contains a stop codon present in

the male transcript. In this way females express a functional transformer protein, and males a nonfunctional one.

transforming growth factor *abbr.*: TGF; either of two types of mitogenic **cytokine**, TGF α and TGF β . TGF α was isolated and purified on the basis of its ability to stimulate cell growth in soft agar. It is produced by macrophages, brain cells, and keratinocytes, and is mitogenic for fibroblasts, is angiogenic *in vivo*, and induces epithelial development. It is a glycoprotein and a member of the **epidermal growth factor** (EGF) family, interacting with the EGF receptor. TGF α comprises 50 amino acids with the following sequence (residues invariant in the EGF family are underlined): VVSFHNDCPDSHTQFCFHGTGRFLVQEDKPAVCYCHSGYV-GARCEHADLLA. TGF β is a multifunctional peptide that controls proliferation, differentiation, and other functions in many cell types. It is produced by fibroblasts, platelets, monocytes, chondrocytes, and osteoblasts. A glycoprotein with EGF repeats, at least five types (TGF β 1 to TGF β 5) are known; all have 112 amino acids except TGF β 5, which has 114. They have a great many biological activities and can be mitogenic or antiproliferative depending on cell type. Platelets contain large amounts, but these proteins are also found in a variety of cell types. Alternative splicing results in different forms of TGF β 1 in platelets and fibroblasts.

transforming growth factor receptor any of the membrane proteins that bind transforming growth factor β (TGF β) and mediate its effects. Three types of receptor for TGF β have been distinguished: types I and II have high affinity for TGF β 1, with lower affinity for TGF β 2; type III has high affinity for TGF β 1, 2, and 3. Types I and II have a single transmembrane domain with a cytoplasmic protein serine/threonine domain. The human type III receptor has a single transmembrane domain and little cytoplasmic structure. It is derived from an 849-amino-acid precursor, of which residues 1–16 are the signal, 17–781 form the extracellular domain (heavily glycosylated), and 808–849 are intracellular. It may present TGF β to the signalling receptors.

transforming principle a historical name for the purified DNA that, when incorporated into a bacterial cell, brings about the **transformation** (def. 1) of that cell. The term was used, most famously, by Oswald Theodore Avery (1877–1955, US bacteriologist and immunologist) and colleagues in their work establishing that DNA, not protein, was responsible for genetic transformation. They used a wild strain of *Pneumococcus*, known as S (for smooth) strain because of the kind of colony that it forms, which is pathogenic; and a mutant strain, known as R (for rough) strain, which is non-pathogenic. When mice were injected with live R strain or heat-killed S strain, they remained healthy, but when injected with a combination of live R strain and heat-killed S strain they died. These workers concluded that the live R strain could be transformed into a pathogenic strain by material from the heat-killed S strain, and were able to demonstrate that the material was DNA.

transfuse to transfer blood from one animal into the circulation of another animal, or to inject liquid into the circulation of an animal to maintain the circulating fluid volume. —**transfusion** *n*.

transgene a gene that is inserted, using cDNA technology, into the germ line in a manner that ensures its function, replication, and transmission as a normal gene. *See also transgenesis, transgenic.*

transgenesis the creation in plants or animals of a stably incorporated gene or genes derived from another cell or organism which can be passed on to successive generations.

transgenic describing an organism harbouring in its germ line a gene that has been introduced using cDNA technology (*see complementary DNA*). In animals, the transgene is introduced during transient culturing of an egg or early embryo, which is then implanted into a foster mother. Several techniques are available: cells may be transferred from one embryo to another (to produce a **chimera**); **pluripotent** cells can be introduced into an embryo; cells infected with a retrovirus can be introduced; or cDNA can be introduced by microinjection into the pronucleus of a fertilized egg. In plants, plasmids from *Agrobacterium tumefaciens* have been widely used to produce transgenic varieties. The **Ti plasmid** is a natural vector for genetically engineering plant cells, because it can transfer its **T-DNA** to the plant genome. Expression of the introduced genes can be

controlled by suitable promoters, such as the cauliflower mosaic virus promoter.

transgenomes large complexes of DNA found inside recipient cells following transfection of the latter with calcium phosphate-precipitated DNA.

transgenesis the transfer of genetic information between unrelated organisms and its expression (including gene maintenance, transcription, translation, and function), especially when donor and recipient cells are widely separated by evolution (e.g. bacterial and eukaryotic cells respectively) and when the mechanisms of gene transfer and maintenance are obscure. *Compare transgenesis.*

transglutaminase an alternative name for **protein–glutamine γ -glutamyltransferase**.

transglycosylation a chemical reaction in which one glycosyl residue is transferred from a glycoside onto a receptor molecule so as to form a new glycosidic linkage, e.g. in the biosynthesis of polysaccharides. The process involves breaking simple glycosidic linkages and reforming them into different types of glycosidic linkages. **Glycosyltransferases** are in subclass EC 2.4; also included in the term are glycosyl transfers to water and to inorganic phosphate.

transient 1 temporary, transitory, short-lived. **2** a sudden, short-lived disturbance in a system. **3** a short-lived chemical species such as an excited atom or molecule or a free radical.

transient expression the phenomenon whereby following transfection of mammalian cells with recombinant DNA a high level of expression of the protein of interest may be possible for only a few days. *Compare stable expression.*

transient-phase kinetics an alternative name for **pre-steady-state kinetics**.

transient receptor potential channel *see* **TRP channel**.

trans isomer *see cis–trans isomer*.

transition (in molecular biology) a type of mutation of DNA that occurs by replacement of one purine by another purine, or one pyrimidine by another pyrimidine whether by chemical change or by substitution. *Compare transversion.*

transition element or **transition metal** any element whose atom has an incomplete d-subshell of extranuclear electrons, or which gives rise to a cation or cations with an incomplete d-subshell. Such elements fall into groups 3 to 11 inclusive of the IUPAC **periodic table**. (Elements of group 12, which formerly were also considered as transition elements, have complete d-subshells and are now excluded.) The first series of transition elements is in period 4 of the periodic table and comprises those of proton numbers 21 to 29 inclusive, i.e. the elements scandium, titanium, vanadium, chromium, manganese, iron, cobalt, nickel, and copper; the second series is in period 5 and comprises those of proton numbers 39 to 47 inclusive, i.e. the elements yttrium, zirconium, niobium, molybdenum, technetium, ruthenium, rhodium, palladium, and silver; the third group is in period 6 and comprises those of proton numbers 57 to 79 inclusive, i.e. the **lanthanoids** together with the elements hafnium through to gold; and the fourth series is in period 7 and contains those of proton numbers 89 to 103 inclusive, i.e. the **actinoids**, and may well be found also to contain a number of elements of proton number 104 or more that yet remain to be characterized or discovered. The lanthanoids and actinoids are designated **inner transition elements** of periods 6 and 7 respectively; their atoms also have incomplete inner f-subshells of electrons. All transition elements are metals, they often have more than one valency state, and they form many coordination complexes, which frequently are coloured.

transition state or **activated complex (in enzymology)** the state of most positive molar **Gibbs energy** through which an assembly of atoms must pass on going from the reactants of a single-step chemical reaction to the products. This is the state that occurs immediately after binding of the reactants to the enzyme's active site; it is during this time that transient bonds between reactants and enzyme are first formed, and initial electronic interactions occur. It is followed by a state in which more stable intermediates form, prior to the eventual formation of products.

transition-state theory the theory that relates the rate of an enzymic reaction to the difference in **Gibbs energy** between the **transition**

state and **ground state** (ΔG^\ddagger). If x is the ground state and x^\ddagger the transition state, then the rate of decomposition of x is given by:

$$-d[x]/dt = \nu[x^\ddagger] = [x](kT/h)\exp(-\Delta G^\ddagger/RT),$$

where ν is the vibrational frequency of the bond that is breaking, h is the Planck constant, k the Boltzmann constant, R the gas constant, and T the thermodynamic temperature.

transition temperature *symbol:* T_i ; (of a membrane lipid) the surface temperature at which a heated lipid bilayer undergoes transition from one physical state (e.g. liquid crystalline) to another (liquid). *See also pretransition temperature, phase transition (of lipids).*

transit peptide any ~4 kDa peptide sequence at the N or C terminus (or both) of cytoplasmically synthesized precursor proteins of certain chloroplast proteins that contains the information to ensure both the specific post-translational transport of the protein into the chloroplast and its localization within the organelle. The transit peptide is removed within the chloroplast.

transit time the time taken by a coenzyme or metabolite in travelling between two enzymes. If the two enzyme reactions were infinitely fast, the overall velocity would be determined by the reciprocal of the transit time.

transketolase EC 2.2.1.1; *systematic name:* sedoheptulose-7-phosphate:D-glyceraldehyde-3-phosphate glycolaldehydetransferase; *other name:* glycolaldehyde transferase. An enzyme that catalyses the transfer of a glycolaldehyde (HOH₂C–CHO–) moiety from xylulose 5-phosphate to ribose 5-phosphate to form glyceraldehyde 3-phosphate and sedoheptulose 7-phosphate, in the pentose phosphate pathway. It requires thiamine diphosphate (TPP) as coenzyme; a glycolaldehyde–TPP intermediate is formed transiently during the reaction. It has broad substrate specificity. Measurement of transketolase activity in a red cell hemolysate, in the presence and absence of thiamin, gives an indication of the thiamin status of the individual (by revealing the degree of activation of the enzyme in the absence of thiamin).

translation 1 (in molecular biology) the process by which a particular sequence of bases in messenger RNA (mRNA) determines a sequence of amino acids in a polypeptide chain during **protein and peptide biosynthesis**. One or more specific base triplets (codons) code for each of the 20 amino acids (*see genetic code*). Each codon of the mRNA molecule is recognized by the corresponding anticodon on the **transfer RNA** (tRNA) to which the amino acid is attached. The tRNA binds to a site on the large subunit of the **ribosome**, which is associated with the small subunit to which the mRNA is bound. The first codon (the initiation codon) in each mRNA molecule is AUG, which codes for formylmethionine (in prokaryotes and mitochondria) or methionine (in eukaryotes). The methionine or formylmethionine, or just the formyl group, is removed before the chain is completed. Completion of translation is signalled by one of three termination codons. **Release factors** effect the release of the complete polypeptide chain and the dissociation of the ribosomal subunits. **2** movement or displacement laterally in space without rotation or change of orientation.

translational frictional coefficient *see frictional coefficient*.

translational fusion an alternative name for **gene fusion**.

translation in vitro an alternative name for **in vitro translation**.

translation start site the mRNA codon at which the ribosome initiates the process of translation of the sequence into an amino acid sequence. The start codon is usually AUG (coding for methionine); in prokaryotes it may also be GUG (leucine). In prokaryotes, ribosome binding to the AUG is mediated by the **Shine–Dalgarno sequence**. In eukaryotes, recognition of the AUG is mediated by the **Kozak sequence**, which the 40S ribosomal subunit locates by scanning the message starting from the 5' end.

translocase a system catalysing translocation of a substrate across an osmotic barrier. *See EF-G, translocator.*

translocation a vectorial transfer process, e.g. of a solute across a membrane. *See also chromosomal translocation. —translocational adj.*

translocator or **porter 1** a system catalysing a secondary translocation reaction, i.e. one not involving primary bond exchanges between different pairs of chemical groups or the donation and acceptance of electrons. **2** any molecular group that is attached to a substrate during transport of the latter across a membrane.

translocon a translocation complex that is the specific site of protein translocation across the endoplasmic reticulum. It involves the **signal recognition particle receptor**. The component proteins, called **translocon-associated proteins** (*abbr.*: TRAP), may be involved in ensuring retention in the endoplasmic reticulum of resident proteins. TRAP proteins form a heterotetramer of α , β , γ , and δ subunits.

translucent transmitting light (or other radiation) with some scattering or diffusion. Consequently, objects cannot be clearly distinguished through translucent materials. *Compare transparent.* —*translucence or translucency n.*

transmembrane domain *abbr.*: TM domain; a region of a protein sequence that traverses a membrane. For alpha-helical structures this is normally a span of 20–25 residues; for beta-structures the span is generally shorter, typically \approx 12 residues. Alpha-helical TM domains are often predicted by the presence of characteristic peaks and troughs in **hydropathy profiles**.

transmembrane protein any protein that traverses the membrane, especially the plasma membrane. For the different types, *see membrane protein*.

transmethylation the transfer of a methyl or methylene group, as frequently occurs in **one-carbon metabolism**. Methyltransferases are in sub-subclass EC 2.1.1, and enzymes concerned with one-carbon metabolism are in sub-subclass EC 2.1.2. *See also C₁ compound, folate coenzymes, S-adenosylmethionine.*

transmissible dementia *see prion.*

transmissible spongiform encephalopathy *abbr.*: TSE; *see spongiform encephalopathy.*

transmission 1 the act, process, or an instance of transmitting. **2** the proportion of radiant energy that is transmitted perpendicularly through a substance or solution; *compare transmittance.* **3** the delivery of a nerve stimulus across a **synapse**, e.g. by a neurotransmitter.

transmission coefficient (*in nuclear physics*) the probability that a particle striking a nucleus penetrates it.

transmission electron microscope *abbr.*: TEM; *see electron microscope.*

transmission factor *an alternative name for transmittance.*

transmittance or transmission factor 1 (*in chemistry*) *symbol*: T ; the ratio I/I_0 , where I_0 is the intensity of electromagnetic radiation falling on a body or substance and I the intensity after transmission through it. It is a dimensionless physical quantity. **2** (*in physics*) *symbol*: τ ; the fraction of radiant energy that, having entered an absorbing substance, reaches its far boundary. It is given by

$$\tau = \Phi_{tr}/\Phi_0 = \exp(-\kappa l),$$

where Φ_{tr} and Φ_0 are the radiant powers of the transmitted and incident radiation, κ is the molar napierian absorption coefficient, c the speed of light in the medium, and l the path length.

transmitter-gated channel *see ion channel.*

transparent transmitting light with little scattering or diffusion so that objects beyond the transparent material can be clearly distinguished. The term can be used in appropriate circumstances to indicate materials allowing the passage of other electromagnetic, particulate, or sonic radiation without disturbance. *Compare translucent.* —*transparency n.*

transpeptidase 1 *an alternative term for peptidyltransferase.* **2** the enzymic activity of a number of proteinases that catalyse, apart from hydrolysis of peptide links, the replacement of one terminal amino acid residue in a peptide by another amino acid or other suitable molecule. **3** certain aminoacyltransferase enzymes, e.g. D-glutamyl transpeptidase, D-glutamyltransferase (EC 2.3.2.1), and glutamyl transpeptidase (i.e. γ -glutamyltransferase, EC 2.3.2.2).

transpeptidation a reaction catalysed by a **transpeptidase**.

transphosphoribosidase *see adenine phosphoribosyltransferase.*

transplantation antigen *an alternative term for histocompatibility antigen.*

transport the movement of a material from one place to another, especially the movement of substances around the body (e.g. in blood) or across a biological membrane, or of electrons along a series of carriers. This term implies a positive agency, compared with **passive diffusion**. *See also active transport, antiport, facilitated diffusion, symport, transport protein.*

transporter a membrane protein catalysing the passage of molecules across a membrane.

transport method *see transport process.*

transport number *an alternative term for transference number.*

transport piece *see secretory piece.*

transport process any process, such as sedimentation, diffusion, or electrophoresis, that is irreversible in the thermodynamic sense, the system being removed from a state of equilibrium. Such processes are of particular value in providing information about the dimensions, shapes, and masses of macromolecules.

transport protein a protein that is instrumental in transporting material, often in a specific manner, across a biological membrane, or within a biological fluid (e.g., blood). *See TC system.*

transposable element *another name for transposon.*

transposase an enzyme that is responsible for the transposition of **transposable elements** or **transposons**. Transposases are involved in site-specific DNA recombination required for transposition in bacteria and other organisms.

transpose 1 to alter the position of; to interchange or place in a different order. **2** (*in mathematics*) **a** to interchange the rows and columns of a **matrix** (def. 8). **b** the matrix resulting from interchanging the rows and columns of a given such matrix.

transposition 1 the process of transposing or the state of being transposed. **2** something that has been transposed; especially a segment of a chromosome or a piece of a DNA molecule.

transposition sequence *an alternative name for translocation sequence.*

transposon or transposable element a specific DNA sequence that is transferred from one **replicon** to another. Transposons were first identified as a result of work on **transposable elements** and also as spontaneous insertions in bacterial operons. The simplest are referred to as **insertion sequences**, being designated IS followed by a number related to the sequence in which they were identified, preceded by an indication of the site of insertion followed by a double colon (thus $\lambda::IS1$ indicates an IS1 element inserted into phage lambda). Each transposon is flanked by repeated sequences, due to short sequences copied from the original gene called **target repeats** or **direct repeats**, and also due to short inverted repeats that are a property of the insert. More complex transposons, called **composite transposons**, may have a central portion having a variety of markers, and flanked by IS elements that are responsible for identifying the transposon for transposition. These are designated Tn followed by a number. In eukaryotes, transposons constitute much of the **repetitive sequences** in the genome, with up to a few hundred repeat copies. They are flanked by terminal inverted sequences; the terminal sequences in each strand characteristically represent the complementary bases of the inverted sequence, i.e. TCAG.....CGTA. Some transposons move physically from one site to another, while others are replicated, with one copy remaining at the original site and a duplicate inserting elsewhere. Both mechanisms involve a **transposase** enzyme; the former also requires a **resolvase** enzyme.

transthyretin a thyroid-binding protein occurring in the bloodstream, and having an unusual structure. The molecule is a homotrimer, each monomer comprising two four-stranded β -sheets, and having the shape of a prolate ellipsoid. Two of the monomers dimerize, and the dimers themselves dimerize to form a structure with an internal channel. Defects in transthyretin cause various forms of amyloidosis and hyperthyroxinemia.

trans-translation the transfer of a nascent polypeptide from a stalled bacterial ribosome onto a **tmRNA** followed by translation of the open reading frame (ORF) of the tmRNA.

transudate any fluid, with its solutes, that has passed through a membrane or through the interstices of a system.

transude to pass or be passed through a membrane or the interstices of a system as a **transudate**. —*transudation n.*

transverse relaxation a process in magnetic resonance spectroscopy, such as EPR and NMR, that describes the decay of transverse (x,y) magnetization. The characteristic spin-spin relaxation time is normally given the symbol T_2 .

transversion a type of mutation of DNA involving the insertion of a purine in place of a pyrimidine, or vice versa. *Compare transition.*

trans-zeatin-producing protein an isopentenyl transferase (di-

methylallyl transferase) of sub-subclass EC 2.5.1. It introduces the isopentenyl moiety (2-methylbut-2-en-1-ol group) into zeatin.

TRAP *abbr. for 1* translocon-associated protein; *see translocon. 2* thyroid-hormone receptor-associated protein; a multiprotein complex of human cells that is associated with ligand-bound thyroid hormone receptor. It has an almost identical subunit composition to that of **SMCC**. It is the equivalent of the yeast transcriptional coactivator mediator.

trap hypothesis 1 a mechanism for the binding of proteinases by α_2 -macroglobulin (α_2 M). It proposes that, when α_2 M interacts with a proteinase, hydrolysis of one or more peptide bonds in its **bait region** occurs, whereupon α_2 M undergoes a conformational change that entraps the proteinase molecule, thus hindering reaction between the proteinase and other large substrate molecules. **2** *see methyltetrahydrofolate trap hypothesis.*

TRASH domain *abbr. for* trafficking, resistance, and sensing heavy metals domain; a well-preserved protein-sequence motif (≈ 38 residues) that contains three cysteine residues and is predicted to form a treble-clef finger (three or four beta strands with a C-terminal alpha helix) for metal coordination. It is present in many prokaryotic and several vertebrate proteins, alone or with other motifs.

Trasylol *a proprietary name for* aprotinin.

TRE *abbr. for 1* TPA response element, a response element for phorbol esters. **2** **thyroid response element.** *See response element.*

Treacher Collins syndrome an autosomal dominant disorder of craniofacial development caused by mutation of the 'treacle' gene *TCOF1* (locus 5q32-q33.1). The treacle gene product is a nucleolar phosphoprotein that participates in the 2'-O-methylation of pre-rRNA. [After Edward Treacher Collins (1862–1919), British ophthalmologist.]

tree length the total number of steps required to map a data set onto a phylogenetic tree, or the sum of the estimated or actual branch lengths in a tree.

trefoil domain *an alternative name for* P domain.

trefoil factor (*abbr.:* TFF) or **trefoil peptide** a family of abundant, highly stable and conserved polypeptides (≈ 60 amino acids long) secreted mainly by the mammalian gastrointestinal mucosa. Each member contains six conserved cysteine residues, predicted to form three intrachain loops (*see* P domain). There are three species in human: **p52** (52 amino acids), which is produced by gastric fundus and is highly expressed in cancers and around ulcerative disease of the upper intestinal tract; **SP** (spasmolytic polypeptide); and **ITF** (intestinal trefoil factor), which is secreted by goblet cells of musosa of intestine and colon especially at sites of injury, inflammation, or dysplasia. They are thought to be involved in repair of mucosal damage.

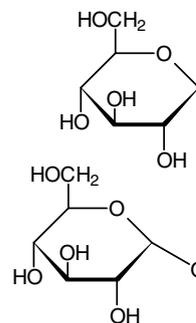

trefoil motif *an alternative name for* P domain.

trehalose α -D-glucopyranosyl- α -D-glucopyranoside; α,α -trehalose; a nonreducing disaccharide, *also known as* **mushroom sugar** or **mycose**, that acts as a reserve carbohydrate in certain fungi (especially yeasts), algae, and lichens. It is cleaved by trehalase but not by most other α -glucosidases. It is a component of **cord factors**, which are a mixture of trehalose 6,6'-mycolates (*see* **mycolic acid**). α -D-Glucopyranosyl- β -D-glucopyranoside (α,β -trehalose) and β -D-glucopyranosyl- β -D-glucopyranoside (β,β -trehalose) occur naturally, but only very rarely. The carbohydrate is a **compatible solute** that acts as a cryoprotectant in many microorganisms, and is used industrially as a preservative in foods and pharmaceuticals.

TR EMBL *abbr. for* translated EMBL; *see* **sequence database.**

tremerogen any of a group of oligopeptides that contain non-amino-acid components and are the sex hormones of the jelly fungi. They induce formation of a conjugation tube in compatible cell types. They may contain a farnesyl group bound to cysteine.

Tresyl *proprietary name* indicating the 2,2,2-trifluoroethane sulfonyl group; Tresyl-activated Sepharose can be used in the preparation of affinity gels, the sulfonyl groups being readily displaceable by amines, thiols, phenolic groups, or imidazole, which remain bound to the gel as the stationary component; e.g.

trehalose

tretinoin *a WHO-approved nonproprietary name for* **retinoic acid**, especially for pharmacological use.

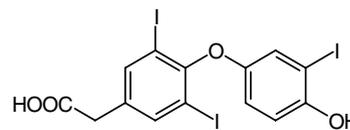

TRF *abbr. for 1* thyrotropin-releasing factor; i.e. **thyrotropin-releasing hormone. 2** T-cell-replacing factor; *see* **interleukin 5. 3** telomeric repeat-binding factor. *See* **TEP-1.**

TRF-III or **TRF-m** *see* **interleukin 1.**

TRH *abbr. for* thyrotropin-releasing hormone.

tri+ *comb. form 1* denoting three, threefold, thrice, every third; *see also* **tris+**. **2** (*in chemical nomenclature*) (*distinguish from* **tris+** (def. 2)) **a** indicating the presence in a molecular entity of three identical specified unsubstituted groups, e.g. trichloroethylene, trimethylamine. **b** indicating the presence in a molecular entity of three identical oxoacid residues in linear anhydride linkage; e.g. adenosine 5'-triphosphate.

triac (*informal*) *abbr. for* 3,3',5-triiodothyroacetic acid, a catabolite of **thyroxine**.

triaconta+ or (*before a vowel*) **triacont+** *comb. form* denoting thirty or thirty times.

triacontanoic acid melissic acid; a 30-carbon straight-chain aliphatic acid; m.p. 93.6°C (methyl ester 71.5°C).

triacontapeptide a 30-residue peptide.

triacylglycerol or (*formerly*) **triglyceride** any triester of glycerol; the three fatty acids may all be the same, or differ in any permutation. Triacylglycerols are important components of plant oils, animal fats, and animal plasma lipoproteins. The degree of unsaturation of the component fatty acids determines the melting point: plant oils, which typically contain a high percentage of (poly)unsaturated fatty acids, are liquid, while animal fats, being more highly saturated, are solid or semisolid. *See also* **lipoprotein** and individual plant oils and animal fats.

triacylglycerol lipase EC 3.1.1.3; *systematic name:* triacylglycerol acylhydrolase; *other names:* lipase; triglyceride lipase; tributyrase. An enzyme that catalyses the reaction:

There are various types ranging from those found in microorganisms to those such as **pancreatic lipase**, and the hormone-sensitive lipase of mammalian adipose tissue. That from the yeast *Geotrichum candidum* is a 544-amino-acid globulin with mainly alpha helix and turns; it contains one modified glutamine residue (pyrrolidone carboxylic acid).

triad a group of three; e.g. three amino acid residues can constitute a catalytic triad.

triadin a major membrane glycoprotein of the sarcoplasmic reticu-

lum triad junction of skeletal and cardiac muscle. The luminal domain has a highly conserved region, and can bind both the ryanodine receptor and calsequestrin.

+triosa *suffix* used in nomenclature to indicate a molecule containing an oligosaccharide moiety composed of three sugar residues (which may be the same or different), as in gangliotriaose. *Distinguish from triose.*

triazine-dye affinity chromatography a type of **dye-ligand chromatography** in which the coupled dye is a triazinyl compound. It is not **affinity chromatography** in the original sense.

Triazol reagent a proprietary reagent used for the extraction of RNA from tissues.

tribbles a protein of *Drosophila* that inhibits mitosis in early development by binding to String (a Cdc25 homologue) and promoting its ubiquitination and degradation by proteasomes. It contains a truncated kinase motif, but lacks an ATP-binding site and *in vitro* kinase activity. The mammalian homologues TRB1, 2, and 3 strongly resemble tribbles. *See NIPK.*

tributyltin chlorotributylstannane; tri-N-butyltin chloride, SnBu₃; an organometallic compound, used primarily as a biocide in antifouling paints. It is extremely toxic to aquatic life and causes severe reproductive effects in aquatic organisms.

TRiC *see* TCP-1.

tricaprin a *trivial name* for **tridecanoin**, the triacylglycerol containing three caproyl (decanoyl) residues. *See also* **tricaproin**, **tricaprylin**.

tricaproin a *trivial name* for **trihexanoin**, the triacylglycerol containing three capric (hexanoic) ester residues. *See also* **tricaprin**, **tricaprylin**.

tricaprylin a *trivial name* for **trioctanoin**, the triacylglycerol containing three caprylic (octanoic) ester residues. *See also* **tricaprin**, **tricaproin**.

tricarboxylic acid *abbr.*: TCA; any organic compound having three carboxylic-acid groups. The name often has the connotation of relationship with **citric acid**, as in the **tricarboxylic-acid cycle**.

tricarboxylic-acid cycle (*abbr.*: TCA cycle) or **citric-acid cycle** or **Krebs cycle** a nearly universal metabolic pathway in which the acetyl group of acetyl coenzyme A is effectively oxidized to two CO₂ and four pairs of electrons are transferred to coenzymes. The acetyl group combines with oxaloacetate to form citrate, which undergoes successive transformations to isocitrate, 2-oxoglutarate, succinyl-CoA, succinate, fumarate, malate, and oxaloacetate again, thus completing the cycle. In eukaryotes the tricarboxylic acid is confined to the mitochondria. *See also* **glyoxylate cycle**.

trichloroacetic acid *abbr.*: TCA; Cl₃CCOOH; an organic acid widely used for the precipitation of protein from tissue and other cell extracts. A final concentration of 3–9% (w/w) is normally used. TCA can be extracted into diethyl ether.

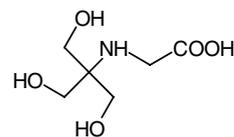

trichloroethyl alcohol 2,2,2-trichloroethanol; an active metabolite of chloral hydrate with CNS depressant actions.

trichohyalin a structural protein produced and retained in cells of the inner root sheath and medulla of the hair follicle. In the sheep, 75% of its amino acids are glutamate or glutamine, arginine or lysine; the gene is also expressed in epithelia, hoof, and rumen. Trichohyalin associates in regular arrays with keratin intermediate filaments.

trichostatin A an antifungal antibiotic from *Streptomyces platensis*. It is a reversible inhibitor of histone deacetylase.

trichothiodystrophy a syndrome of neurological dysfunction, premature ageing, photosensitivity, and brittle hair and nails. It is caused by a defect in **nucleotide excision repair** as a result of mutations in the xeroderma pigmentosum complementation proteins XPB (782 amino acids) and XPD (760 amino acids). These are DNA helicases, the largest subunits of transcription factor TFIIH, and essential for transcription initiation.

tricine or **TRICINE** *trivial name* for *N*-tris[(hydroxymethyl)methyl]glycine; *N*-[2-hydroxy-1,1-bis(hydroxymethyl)ethyl]glycine; a **Good buffer substance**; p*K* (20°C) = 8.15.

tricorn protease a protease (1071 amino acids) with trypsin-like specificity that is abundant, with proteasomes, in archaeobacteria such as *Thermoplasma acidophilum*. It forms a homohexameric toriid that resembles a tricorn hat, and cleaves oligopeptides produced by proteasomes into di-, tri-, and tetrapeptides. Aminopeptidases with different specificities are usually associated with it.

tricoso+ or (*before a vowel*) **tricos+** *comb. form* denoting twenty-three or twenty-three times.

tricosapeptide a 23-residue peptide.

trideca+ or (*before a vowel*) **tridec+** denoting thirteen or thirteen times.

tridentate 1 having three teeth or toothlike projections. **2** (of a ligand) chelating a metal ion by means of three donor atoms.

triene any alkatriene or substituted alkatriene.

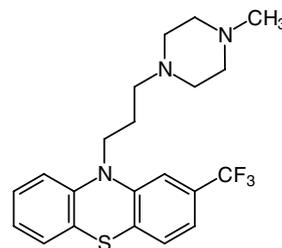

+triene(+) or (*before a vowel*) **+trien+** (*in chemical nomenclature*) *infix or suffix* in systematic names denoting the presence in a molecular structure of an unsaturated aliphatic hydrocarbon chain containing three (conjugated or unconjugated) double bonds. The position of each double bond may be indicated by a locant for its lowest numbered carbon atom; e.g. cycloheptatriene, icoso-8,11,14-trieneoic acid.

trienoic indicating a compound having a carboxylic-acid group and an aliphatic chain with three double bonds.

trienoyl indicating the acyl group of a trienoic acid.

triflavin a **disintegrin** from the snake *Trimeresurus flavoviridis*, containing an Arg-Gly-Asp (**RGD**) motif, that inhibits fibrinogen interaction with platelet receptors, and thereby inhibits platelet aggregation.

trifluoperazine 10-[3-(4-methyl-1-piperazinyl)propyl]-2-(trifluoromethyl)-10*H*-phenothiazine; an antagonist with high affinity for D₂ **dopamine receptors**. It is used in the treatment of manic and schizophrenic psychoses and as an inhibitor of **calmodulin** action. *One proprietary name*: Stelazine (dihydrochloride).

trifluoroacetic acid *abbr.*: TFA; CF₃COOH; a strong organic acid used: (1) as a catalyst in organic synthesis; (2) to cleave Cbz- and tBoc- groups from protected amino acids; and (3) as the anhydride, to prepare trifluoroacetyl derivatives for the protection of alcohols and amines, and as volatile derivatives for gas-liquid chromatography.

trifunctional protein an enzyme protein complex, present on the matrix side of the inner mitochondrial membrane, that has long-chain 2-enoyl-CoA hydratase, long-chain 3-hydroxyacyl-CoA dehydrogenase, and long-chain 3-ketoacyl-CoA thiolase activities. That from rat liver consists of four α subunits (79 kDa), which bear the first two aforementioned activities, and four β subunits (51 kDa), which bear the third activity. Deficiency is associated with massive excretion of long-chain 3-hydroxyacetic acids. In **type 1 deficiency**, probably a defect of the α subunits, only the dehydro-

genase activity is lacking. In **type 2 deficiency**, probably a defect of β subunits, all three activities are lacking.

trigger 1 to induce (often rapidly) into activity. **2** a mechanism or agent that brings about such an action. The term is commonly used in connection with membrane receptor activation and signal transduction, as in trigger mechanism.

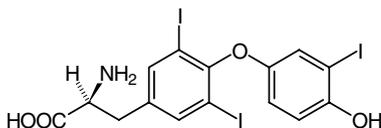

trigger factor a 48 kDa protein of eubacteria that binds ribosomes in 1:1 stoichiometry, and also binds nascent ≈ 57 -residue polypeptides by hydrophobic interaction. It dissociates from the nascent chain after this is released from the ribosome. It has **peptidylprolyl isomerase** activity but binds nascent chains independently of their proline content. See **NAC**.

triglyceride a former name for **triacylglycerol**; this usage is discouraged because 'triglyceride' is properly a generic term for compounds having three glyceryl residues (e.g. **cardiolipin**).

trigonelline nicotinic acid *N*-methylbetaine; 3-carboxy-1-methylpyridium inner salt; a metabolite of nicotinic acid. It is excreted in the urine after the consumption of relatively large amounts of nicotinic acid. It is also produced in alfalfa root exudates, where it induces *nod* genes in some *Rhizobium* species.

trihydric (of a chemical compound) containing three hydroxyl groups per molecule; trihydroxy; used especially of alcohols.

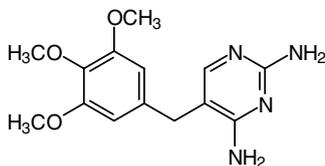

triiodothyronine *abbr.*: T₃; 3,3,5-triiodo-L-thyronine; one of the hormones secreted by the thyroid gland. Plasma levels of T₃ are much lower than those of **thyroxine** (T₄) (20- to 50-fold), but the physiological activity of T₃ is higher. Much of T₄ is converted to T₃ within cells. T₃ binds to a **thyroid-hormone receptor**, which binds to **thyroid response element**, a transcription-regulatory element. See also **thyroglobulin**.

trilaurin a triacylglycerol in which all the fatty-acyl moieties are **lauroyl** (dodecanoyl).

trimer a molecular complex having three components or subunits. If these are identical, it is referred to as a **homotrimer**; if any one is different from any other, it is called a **heterotrimer**. —**trimeric** *adj.*

trimethoprim 2,4-diamino-5-(3,4,5-trimethoxybenzyl)pyrimidine; a specific inhibitor of formylation and a competitive inhibitor of **dihydrofolate reductase**. The trimethoprim resistance gene can be used as a selectable marker for cloning vectors in animals or plants. See also **sulfamethoxazole**.

trimethylaminuria see **fish-odour syndrome**.

trimyrustin a triacylglycerol in which all the fatty-acyl moieties are **myristoyl** (tetradecanoyl).

trinactin a neutral macrotetralide antibiotic with an action similar to that of **nonactin**.

trinitroglycerin glyceryl trinitrate; trinitroglycerol; the nitrate moiety is metabolized to nitrite and, subsequently, to **nitric oxide** and nitrosothiol, which activate guanylate cyclase. The resulting increase in cyclic GMP synthesis may explain the potent vasodilator effects of this and similar organic nitrates.

trinor+ prefix (in a trivial name of a compound) indicating replacement of three methyl groups by hydrogen. See also **nor+**.

trinucleotide repeat an increase in copy number of a normally

polymorphic triplet. Some genetic disorders, e.g. **fragile X syndrome**, result from this.

triol any aliphatic chain having three hydroxyl groups.

triolein a triacylglycerol in which all the fatty-acyl moieties are **oleoyl** (*cis*-9-octadecenoyl). See also **triolein breath-test**.

triolein breath-test a test for intestinal malabsorption of fat. When ¹⁴C-labelled triacylglycerol (10 μ Ci) is administered by mouth, a proportion of the ¹⁴C will be breathed out as ¹⁴CO₂, which is trapped in a solution of hyamine carbonate for scintillation counting.

triose 1 any monosaccharide having a chain of three carbon atoms in the molecule, i.e. the chiral enantiomers *D*- and *L*-**glyceraldehyde**, and their achiral constitutional isomer **glycerone**. **2** trisaccharide; used as a stem name for any oligosaccharide consisting of three residues of the same sugar in a single type of linkage, as in maltotriose. *Distinguish from +triose*.

triose phosphate *D*-glyceraldehyde 3-phosphate, glycerone phosphate, or a mixture thereof. These two compounds are interconvertible by the enzyme **triose-phosphate isomerase**.

triosephosphate dehydrogenase (NADP⁺) see **glyceraldehyde-3-phosphate dehydrogenase (NADP⁺) (phosphorylating)**.

triose-phosphate isomerase *abbr.*: TIM; EC 5.3.1.1; *systematic name*: *D*-glyceraldehyde-3-phosphate ketol-isomerase; *other names*: triosephosphate mutase; phosphotriose isomerase. The sugar **isomerase** enzyme that is important in the glycolytic pathway, and catalyses the aldose–ketose isomerization of the two **triose phosphates**, i.e. the reaction:

trioxalen 2,5,9-trimethyl-7*H*-furo[3,2-*g*][1]-benzopyran-7-one; 4,5',8-trimethylpsoralen (*abbr.*: TMP); a pigmentation agent (photosensitizer). See also **psoralen**.

tripalmitin a triacylglycerol in which all the fatty-acyl moieties are **palmitoyl** (hexadecanoyl).

tripeptide a three-residue peptide.

triphenylmethyl group *abbr.*: trityl; a group used in chemical syntheses to protect nitrogen, sulfur, and, particularly, oxygen functions as their trityl derivatives. It is stable under many conditions, and readily removed by mild acid. It can be introduced by reagents such as triphenylmethyl chloride.

triphosphate 1 the pentavalent ion, P₃O₁₀⁵⁻, derived from triphosphoric acid, decaoxotriphosphoric(v) acid, (HO)₂PO–O–PO(OH)–O–PO(OH)₂ (an acid not known in the free state). **2** any mixture of the anions of triphosphoric acid. **3** any (partial or full) salt or ester of triphosphoric acid. **4** any organic compound containing three phosphoric residues linked linearly by oxygen atoms. **5** name of the univalent group –O–PO(OH)–O–PO(OH)–O–PO(OH)₂ (irrespective of its state of ionization). **6** (*formerly*) any organic compound containing three independent phosphoric residues attached to different parts of the molecule; now incorrect, use **trisphosphate**.

triphospho+ 1 prefix to a chemical name indicating the presence in ester linkage of a triphosphoric residue. **2** (*formerly*) prefix to a chemical name indicating the presence of three independent phosphoric residues in ester linkages; now incorrect, use **trisphospho+**.

triphosphoinositide *abbr.*: TPI; a former name for **phosphatidylinositol 4,5-bisphosphate** (*symbol*: PtdIns-4,5-P₂). Current nomenclature requires bisphosphate, triphosphate, etc. for the substituent phosphates on the inositol moiety. Other phosphatidylinositol bisphosphates are known, e.g. PtdIns-phosphatidylinositol 3,4-bisphosphate.

triphosphopyridine nucleotide (oxidized) *abbr.*: TPN⁺; an *obsoleto* name for **nicotinamide-adenine dinucleotide phosphate**.

triphosphopyridine nucleotide (reduced) *abbr.*: TPNH; an *obsoleto* name for **nicotinamide-adenine dinucleotide phosphate (reduced)**.

triphosphoric *symbol*: PPP or (in the one-letter convention for nucleotides) ppp; *general name* for a residue of triphosphoric acid, (HO)₂PO–O–PO(OH)–O–PO(OH)₂, whether singly or multiply attached through oxygen to other groups and whether or not any residual hydroxyl groups are dissociated.

triple bolus test see **combined test of pituitary function**.

triple helix 1 (*in proteins*) a superhelically coiled arrangement of

three polypeptide chains, e.g. as in **tropocollagen. 2** or (*sometimes*) **triplex** *see* **triplex DNA**.

triple membrane *see* **unit membrane**.

triple point the point on a phase diagram at which three phases may coexist.

triplet 1 (*in molecular biology*) any sequence of three purine and/or pyrimidine bases in nucleic acids that specifies a particular amino acid. It is synonymous with **codon** in mRNA or **anticodon** in DNA or tRNA. *See also* **synonym triplet. 2** a collection of three of a kind. **3** any one of three offspring born from a single pregnancy.

triplet code the **genetic code**, which is based on **triplets** (def. 1) of purine and pyrimidine bases.

triplet repeat any stretch of DNA that has the same three nucleotides (triplet) repeated in tandem fashion.

triplet repeat disorder a genetic disease resulting from the expansion of triplet repeats, such as Huntington's disease (CAG), fragile X syndrome (CGG), and myotonic dystrophy (CTG).

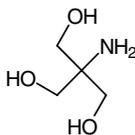

triplex DNA a three-stranded structure formed by duplex DNA in association with an oligonucleotide, when purine or pyrimidine bases occupy the major groove of the DNA double helix adopting **Hoogsteen base pairing** with the Watson–Crick base pairs. Triplex DNA may be involved as an intermediate in **crossing over**. *See also* **tetraplex DNA**.

triploid 1 describing a cell, tissue, or organism having three times the haploid (monoploid) number of chromosomes. **2** such a cell, tissue, or organism. —**triploidy** *n*.

TRI reagent a proprietary reagent formulated to facilitate the extraction of RNA, DNA, and protein from tissues.

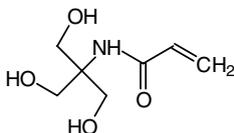

tris+ *prefix 1* denoting three times, thrice, tripled; *see also* **tri+** (def. 1). **2** (*in chemical nomenclature*) (*distinguish from tri+* (def. 2)) **a** indicating the presence in a molecular entity of three identical specified groups each substituted in the same way; e.g. tris(2-hydroxyethyl)amine. **b** indicating the presence at separate positions in a molecular entity of three identical inorganic oxoacid residues; e.g. inositol 1,4,5-trisphosphate.

Tris or **TRIS** or **THAM** tris(hydroxymethyl)aminomethane; 2-amino-2-hydroxymethyl-1,3-propanediol; a compound widely used as a biological buffer substance in the pH range 7–9; pK_a (20°C) = 8.3; pK_a (37°C) = 7.82.

trisaccharide an **oligosaccharide** with three **monosaccharide** units.

Trisacryl 1 a *proprietary name for N*-acryloyl-2-amino-2-hydroxymethyl-1,3-propanediol; $CH_2=CH-CO-NH-C(CH_2OH)_3$; a compound used in the manufacture, by copolymerization with a cross-linking agent such as *N,N'*-diallyl L-tartardiamide (*abbr.*: DATD) or *N,N'*-methylenebisacrylamide, of a range of strongly hydrophilic artificial support materials of controlled porosity that are useful for gel-permeation chromatography. Copolymerization with a cationic or anionic derivative as a third component yields support materials of utility in ion-exchange chromatography. Such materials are thermally, chemically, and biologically stable, and resistant to high pressures. **2** *as modifier* describing a range, or any member of a range, of such chromatographic support materials; e.g. Trisacryl polymers, Trisacryl ion-exchangers, Trisacryl gels, Trisacryl GF05, DEAE–Trisacryl M.

triskelion a hexamer of **clathrin** molecules, composed of three heavy chains and three light chains. In the **electron microscope**, triskelions appear to have three bent arms each linked into a central point. [From *triskele*, a symbolic figure consisting of three legs radiating from a common centre.]

trisomic 1 describing a cell, tissue, or organism having three copies of one or more chromosome(s) in an otherwise diploid chromosome set. In humans, trisomy 21 (i.e. presence of three copies of chromosome 21) is associated with **Down's syndrome. 2** such a cell, tissue, or organism. —**trisomy** *n*.

trisphosphate any compound containing three independent phosphoric residues in ester linkages, at positions indicated by locants; e.g. inositol 1,4,5-trisphosphate. *Compare* **triphosphate**.

trisphospho+ *prefix* to a chemical name indicating the presence of three independent phosphoric residues in ester linkages, at positions indicated by locants. *Compare* **triphospho+**.

tristearin a triacylglycerol in which all the fatty-acyl moieties are **stearoyl** (octadecanoyl).

trithorax one of a group of proteins in *Drosophila* that regulate the expression patterns of many developmental genes. Trithorax group proteins are involved in countering chromatin-based gene silencing to maintain gene activity, and enable established patterns of gene expression to be transmitted over multiple rounds of cell division. *Compare* **polycomb**.

tritiate to combine or label with **tritium**; to replace one or more atoms of hydrogen with tritium. Tritium may be introduced into specific sites by chemical synthesis but 3H -labelled steroids are prepared by the reduction of unsaturated precursors with 3H_2 , the number of 3H atoms introduced depending upon the degree of unsaturation of the precursor and the catalyst used. Biosynthesis is rarely used for 3H -labelling since intramolecular migration of 3H atoms is often caused by enzymes.

tritin a type 1 **ribosome-inactivating protein** from wheat.

tritium the radioactive isotope of hydrogen, 3H (i.e. the nucleus contains two neutrons and one proton). It decays to produce β^- particles of low energy (0.018 MeV); half-life 12.26 years. *Compare* **deuterium, protium**.

tritium nuclear magnetic resonance spectroscopy *abbr.*: tritium NMR spectroscopy or TNMR spectroscopy; the application of **nuclear magnetic resonance spectroscopy** to determine the positions and extents of tritium substitution in substances (generally of known structure) that have been labelled with tritium (3H). The technique depends upon an equality of the displacements of the resonance frequencies (chemical shifts) of tritium and protium (1H) nuclei in corresponding environments relative to those occurring with the tritiated and nontritiated forms, respectively, of a reference substance. The method is quick, nondestructive, and applicable to very small amounts of material. It is thus particularly useful for determining the pattern of labelling in substances that are costly, complex in structure, and/or unstable. The technique is also used to follow the chemical and steric course of biochemical reaction sequences.

triton 1 (*in chemistry*) *symbol*: $^3H^+$; the cation derived from an atom of **tritium**; a **hydron** of nucleon number 3. **2** (*in nuclear physics*) *symbol*: t ; a particle having a charge equal and opposite to that of an electron and having a mass of 3.0155 Da.

Triton the *proprietary name* for any of a series of polyoxyethylene ethers of certain alkylphenols that are surfactants and classed as nonionic detergents. Those used most commonly are based on the formula *tert*-octyl- $C_6H_4-[OCH_2CH_2]_xOH$; e.g. in Triton X-45, $x \approx 5$; in Triton X-100, $x = 9$ or 10 (aggregation number 100–155, CMC 0.2–0.9 mM); in Triton X-405, $x \approx 40$; Triton CF is a benzyl-polyoxyethylene *tert*-octylphenyl ether; Triton N-101 is a polyoxyethylene nonylphenyl ether ($C_9H_{19}-C_6H_4-[OCH_2CH_2]_xOH$), with $x = 9$ or 10.

tritosome a **lysosome** that is loaded with Triton. Tritosomes have an isopycnic density in sucrose solution of about 1.14, and can thus be separated readily from other cell constituents.

tritriaconta+ or (*before a vowel*) **tritriacont+** *comb. form* denoting thirty-three times.

triturate 1 to rub or grind (solid material) to a very fine powder *ei-*

ther dry or in a liquid. **2** a finely ground powder or an even mixture of finely ground powders, especially powdered drugs.

trituration 1 the act of triturating or the condition of being triturated; *see* **triturate** (def. 1). **2** the composing of a dental amalgam.

trityl *trivial name* for the **triphenylmethyl group**.

trivial name (*in chemical nomenclature*) a name of a chemical species that has no part of it used in a systematic sense; e.g. xanthophyll, urea. It generally has historical or colloquial origins, and refers to attributes such as appearance or source. It makes no pretension to describe molecular structure. The adjective 'trivial' has no perjorative meaning, numerous compounds of biochemical interest having approved or recommended trivial names. *Compare* **descriptive name**, **systematic name**.

trixenic *see* **synxenic**.

trk *abbr. for* tropomyosin receptor kinase; a protooncogene encoding a transmembrane tyrosine kinase receptor that is selectively expressed in certain neurons of neural crest origin, or, as its counterpart *trkB*, in cells of the neuroepithelium. It is required for high-affinity binding of nerve growth factor, and neurotrophins 3 and 4. It was discovered as the transforming factor of a colon carcinoma and was originally known as *oncD*. The oncogenic activity results from a genomic rearrangement that produces a hybrid protein consisting of part of a nonmuscle tropomyosin sequence and the transmembrane and cytoplasmic domains of Trk.

tRNA *abbr. for* transfer RNA.

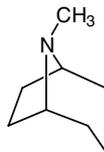

T3 RNA polymerase an enzyme from bacteriophage T3 that will transcribe sequences downstream from the **T3 phage promoter** and is used for *in vitro* transcription.

T7 RNA polymerase an enzyme that will transcribe sequences downstream from the **T7 phage promoter** and is used for *in vitro* transcription.

Trojan horse inhibitor *see* **affinity label**.

Trojan peptide *an alternative name for* **penetratin**.

tropane 8-methyl-8-azabicyclo[3.2.1]octane; the basic ring system in tropane alkaloids.

+trope *suffix* denoting turning.

+troph *suffix* denoting an organism with a specified mode of nutrition, e.g. **autotroph**, **chemotroph**.

trophic of, or concerning, nourishment, nutrition. *Compare* **tropic** (def. 1).

+trophic *suffix* denoting nourishment, nutrition; e.g. organotrophic, saprotrophic. *See also* **+tropic**.

+trophin *noun suffix* denoting a substance having a **trophic** function. *See also* **+trophin**.

tropho+ or (*before a vowel*) **troph+** *comb. form* denoting food or nourishment.

trophoblast the outer part of the blastocyst stage of a mammalian conceptus. Its outermost layer consists of syncytial cells concerned with penetration and implantation into the uterine endometrium; these cells secrete extracellular hydrolases that facilitate movement of the blastocyst into the previously organized endometrial structure.

+troph *noun suffix* **1** denoting food or nourishment. **2** denoting growth or size.

tropic 1 or (*sometimes, esp. Brit.*) **trophic** having a stimulating effect (especially of a hormone, etc.). **2** of or relating to a **tropism**.

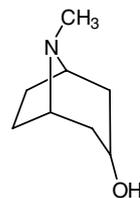

+tropic or (*sometimes, esp. Brit.*) **+trophic** *suffix* denoting a stimulatory function; e.g. gonadotropic. *See also* **+trophic**, **+trophin**.

tropic acid α -phenyl- β -hydroxypropionic acid; (*S*)-3-hydroxy-2-phenylpropanoic acid; a compound that occurs in ester form in **atropine** and other tropane alkaloids.

+trophin or (*sometimes, esp. Brit.*) **+trophin** *noun suffix* denoting a

substance having a stimulatory function, especially a hormone produced by the adenohypophysis. *See also* **+trophin**.

tropine tropan-3 α -ol; 2-hydroxytropane; *N*-methyl-8-azabicyclo[3.2.1]octan-3-ol; **atropine** is the ester with (\pm)-tropic acid. Tropine is a *meso* structure. The -OH group is *trans* to the CH₃N-group. In the geometrical isomer, **pseudotropine**, this relationship is *cis*.

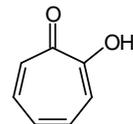

tropinone *N*-methyl-8-azabicyclo[3.2.1]octan-3-one; the oxidation product of **tropine**.

tropism movement directed towards some positive stimulus, or away from some negative stimulus.

+tropism *noun suffix* denoting a specific type of **tropism** as indicated by the prefixed word.

tropocollagen or **soluble collagen** a rod-shaped molecule, 3000 Å long and 15 Å in diameter, consisting of two $\alpha 1$ and one $\alpha 2$ polypeptide chain, each of about 1000 amino-acid residues, of which about a third are glycine, and 21% are proline plus hydroxyproline; they also contain hydroxylysine. The three polypeptide chains wind around each other to form a superhelical cable, the chains of which are hydrogen-bonded to each other. Tropocollagen fibres spontaneously associate, with their N-terminal sequences overlapping C-terminal sequences of adjacent chains in a staggered array, to form **collagen** molecules. *Compare* **procollagen**. *See also* **registration peptide**.

tropolone 2-hydroxy-2,4,6-cycloheptatrien-1-one; a structure found in some mould metabolites and in **colchicine**.

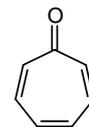

tropomodulin a cytoskeletal tropomyosin-regulatory protein that binds to the end of erythrocyte tropomyosin and blocks its head-to-tail association along actin filaments; it does not bind to F actin. Its modulation of the spectrin-actin complex affects the viscoelastic properties of erythrocytes.

tropomyosin a protein found in smooth, skeletal and cardiac muscle. It comprises α and β subunits, and is bound to **actin**, forming a component of the **tropoin** complex that regulates calcium-dependent binding of actin and myosin and, consequently, muscle contraction. Tropomyosin forms a characteristic coiled coil, with a prominent seven-residue periodicity. Different isoforms are produced by differential splicing; e.g., isoforms of α -tropomyosin differ in striated and smooth muscle.

tropomyosin kinase EC 2.7.1.132; an enzyme that catalyses the phosphorylation of tropomyosin to form *O*-phosphotropomyosin.

tropone 2,4,6-cycloheptatrien-1-one.

tropone

troponin *abbr.*: Tn; a central regulatory protein of striated muscle contraction, comprising three subunits: **troponin T** (Tn-T), which binds to **tropomyosin**; **troponin I** (Tn-I), which regulates actomyosin ATPase; and **troponin C** (Tn-C), which binds Ca^{2+} and, with Ca^{2+} bound, abolishes the inhibition of the binding of myosin to actin filaments produced by the other two troponins.

+trophy *noun suffix* denoting turning.

TROSY *abbr. for* transverse relaxation optimized spectroscopy: a method in NMR spectroscopy that gives sharper peaks for proteins of high molecular mass.

trp a family of tryptophan biosynthetic genes in bacteria. The following examples of *trp* gene products are from *Escherichia coli*.

(1) TrpA and TrpB are the α and β subunits of tryptophan synthase (EC 4.2.1.20); it catalyses the formation of L-tryptophan from L-serine and 1-(indol-3-yl) glycerol 3-phosphate; glycerinaldehyde 3-phosphate is also formed. The enzyme is a tetramer ($\alpha_2\beta_2$); the subunits have half-activities (α for aldol cleavage of indoleglycerol phosphate and β for tryptophan synthesis).

(2) TrpC is a monomeric bifunctional enzyme: the 'TrpF domain' is *N*-(5'-phosphoribosyl)anthranilate isomerase (EC 5.3.1.24); it catalyses the interconversion of *N*-5'-phosphoribosyl-anthranilate and 1-(2-carboxyphenylamino)-1-deoxy-D-ribulose 5-phosphate. The 'TrpC domain' is **indole-3-glycerol-phosphate synthase** (EC 4.1.1.48; *abbr.*: IGPS); it catalyses the decarboxylation of 1-(2-carboxyphenylamino)-1-deoxy-D-ribulose 5-phosphate to form 1-(indol-3-yl) glycerol 3-phosphate, CO_2 , and H_2O .

(3) TrpE/G, **anthranilate synthase** (EC 4.1.3.27); it catalyses a reaction between chorismate and L-glutamine to form anthranilate, pyruvate, and L-glutamate. This enzyme is a tetramer with two molecules of component I (TrpE) and two of component II (TrpG). (4) TrpR, aporepressor (*trp* is co-repressor) for the operators of the *trp* operon, *trpR* itself, and *aroH*; a homodimer of known 3-D structure.

Trp *symbol for* a residue of the α -amino acid L-tryptophan (alternative to W).

Trp-2 tyrosinase-related protein 2; this is a product of the *tyrp-2* gene. *See also* **slaty**.

TRP channel *abbr. for* transient receptor potential channel; any of a family of membrane ion channels, first characterized as *Drosophila* TRP, which is responsible for the depolarization of photoreceptor cells in response to light. Mammalian homologues belong in three classes: short TRP (*or* STRP), long TRP (*or* LTRP), and *osm-9*-like (*or* OTRP). **TRP channel 2** (*or* LTRPC2) is expressed in many human tissues including immunocytes, where it is heptahelical and has a long cytoplasmic tail. It is activated by adenosine diphosphoribose (ADPR) and by NAD (the precursor of ADPR), and is inhibited by ATP. It is a nonspecific cation channel that permits Ca^{2+} influx into cells and has ADPR pyrophosphatase activity. **LTRPC7** is widely expressed in mouse tissues and is an ion channel and protein kinase. The cold and menthol (CMR1) and the heat and capsaicin (TRPM8) receptors are also members of the TRP family.

true cholinesterase *an alternative name for* **acetylcholinesterase**.

true negative an entity that is not a true member of a data set and is not recognized by a discriminator for that data set. *Compare* **false negative**.

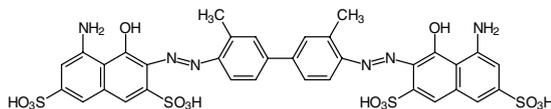

true positive a match that is recognized by a discriminator for a given data set and is a true member of that data set. *Compare* **false positive**.

truncate 1 to shorten by cutting, **2** to terminate prematurely. —**truncation** *n*.

truncated hemoglobin any of a family of small oxygen-binding heme proteins that are widely distributed in eubacteria and protozoa, and nearly ubiquitous in the plant kingdom. They are 20–40 residues shorter than nonvertebrate hemoglobins and are distinct from bacterial flavohemoglobins, plant symbiotic and nonsymbiotic hemoglobins, and animal hemoglobins. They consist of four α helices rather than the eight of animal hemoglobins.

Trypan Blue a blue dye that is water-soluble and possesses sulfate and amino groups, whose charge prevents it from penetrating the plasma membrane of healthy cells. Dead cells or cells with damaged membranes take it up, making it a useful stain for determining cell

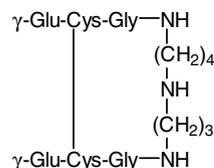

viability (*see* **dye-exclusion test**). It does, however, stain healthy macrophages.

trypanosomatid any protozoan of the order **Kinetoplastida**, which includes **trypanosomes** and other genera.

trypanosome any member of the genus *Trypanosoma* (order **Kinetoplastida**), comprising parasitic flagellate protozoans. Infection causes trypanosomiasis in a range of animals. In humans there are two main forms: African trypanosomiasis (*or* sleeping sickness), which is caused by *T. brucei* and transmitted by tsetse flies, and South American trypanosomiasis (*or* Chagas' disease), which is caused by *T. cruzi* and transmitted by insects such as the assassin bug. Invasion of the nervous system is more common with the African form than with the South American form, which mainly affects the heart.

trypanothione the oxidized form of *N*¹,*N*⁶-bis(glutathionyl)spermidine, derived from the trypanosomatid *Crichidia fasciculata*, a parasite of insects. Members of the **Kinetoplastida** lack **glutathione reductase**, and **glutathione** is converted to the conjugate, trypanothione. *See also* **trypanothione reductase**.

trypanothione reductase EC 1.6.4.8; *systematic name*: NADPH:trypanothione oxidoreductase; an enzyme unique to **trypanosomatids**, and hence a potential chemotherapeutic target. It catalyses the reaction:

FAD is a cofactor. *See also* **trypanothione**.

trypsin EC 3.4.21.4; a serine endopeptidase occurring in two forms, known as α and β trypsin. These result from proteolytic cleavage, β being formed directly from the precursor, **trypsinogen**, and α and other forms by further cleavage. Trypsin is of major importance in protein digestion in the small intestine, trypsinogen being a constituent of **pancreatic juice**. Trypsin is also widely used as a proteolytic agent experimentally, e.g. in protein sequencing. It preferentially cleaves at Arg¹-Xaa and Lys¹-Xaa. *See also* **trypsin inhibitor**.

trypsin inhibitor any naturally occurring substance that inhibits the activity of **trypsin**. *See* **pancreatic trypsin inhibitor**, **soybean trypsin inhibitor**.

trypsinize *or* **trypsinise** to treat something, especially intact cells or membrane preparations, with trypsin. Trypsinization is used to release cells from adhesion to tissue-culture plates, and to indicate domains of integral membrane proteins (unattacked bonds might indicate that they are shielded by inclusion within the membrane). —**trypsinization** *or* **trypsinisation** *n*.

trypsinogen the pancreatic **zymogen** precursor of **trypsin**. It is secreted in **pancreatic juice** and in the duodenum is cleaved by **enteropeptidase**, which cleaves the Lys⁸-Ile⁹ bond in trypsinogen, to yield β trypsin.

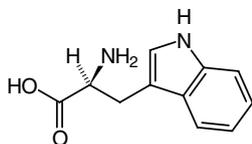

tryptamine β -3-indolyethylamine; 3-(2-aminoethyl)indole; 2-(1*H*-indol-3-yl)ethanamine; ($\text{C}_8\text{H}_9\text{N}$) $\text{CH}_2\text{-CH}_2\text{-NH}_2$; a biogenic amine, formed by enzymic decarboxylation of tryptophan. Of widespread occurrence in mammalian tissues, it is found also in plants, and is a product of microbial degradation of proteinaceous material.

tryptase EC 3.4.21.59; *other names*: mast cell tryptase; mast cell protease II; skin tryptase; lung tryptase; pituitary tryptase. An enzyme

that cleaves Arg-[Xaa, Lys-[Xaa, but with more restricted specificity than **trypsin**. It is a trypsin-like serine endopeptidase released from the secretory granules upon mast-cell activation. Cytotoxic T-lymphocyte tryptase, or CTL tryptase, is **granzyme A**.

tryptic of, or relating to, trypsin; effected or produced by the action of trypsin; especially **tryptic digestion**, the partial hydrolysis of a protein by trypsin.

tryptophan or (formerly) **tryptophane** the trivial name for β -3-indolylalanine; α -amino- β -3-indolepropionic acid; 2-amino-3-(1H-indol-3-yl)propanoic acid; (C₈H₆N)CH₂-CH(NH₂)-COOH; a chiral α -amino acid. L-tryptophan (symbol: W or Trp), (S)-2-amino-3-(1H-indol-3-yl)propanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: UGA (only in mitochondria) or UGG. In mammals, it is an essential dietary amino acid, and is glycoenic. The peptide antibiotic, **tyrocidin C**, contains one residue per molecule of D-tryptophan (symbol: D-Trp or DTrp), (R)-2-amino-3-(1H-indol-3-yl)propanoic acid.

L-tryptophan

tryptophanal α -amino- β -3-indolepropionaldehyde; 2-amino-3-(1H-indol-3-yl)propanal; (C₈H₆N)CH₂-CH(NH₂)-CHO; the α -amino-aldehyde analogue of **tryptophan**.

tryptophanase 1 EC 4.1.99.1; *recommended name*: tryptophanase; *systematic name*: L-tryptophan indole-lyase (deaminating). An enzyme that catalyses a reaction between water and L-tryptophan to form indole, pyruvate, and NH₃. It is responsible for indole formation in *Escherichia coli* and other enteric bacteria and bacilli. The reaction is comparable to that of β -tyrosinase (see **tyrosinase** (def. 2)). **2** an alternative name for **tryptophan 2,3-dioxygenase**.

tryptophanate 1 tryptophan anion; the anion, (C₈H₆N)CH₂-CH(NH₂)-COO⁻, derived from **tryptophan**. **2** any salt in which tryptophan is anionic. **3** any ester of tryptophan.

tryptophan 2,3-dioxygenase EC 1.13.11.11; *systematic name*: L-tryptophan:oxygen 2,3-oxidoreductase (decyclizing); *other names*: tryptophan pyrrolase; tryptophanase; tryptophan oxygenase; tryptamine 2,3-dioxygenase. An enzyme that catalyses a reaction between dioxygen and L-tryptophan to form L-formylkynurenine. It is a heme protein in mammalian liver, and it shows broad specificity towards tryptamine and other derivatives.

tryptophan 5-hydroxylase EC 1.14.16.4; *recommended name*: tryptophan 5-monoxygenase; *systematic name*: L-tryptophan, tetrahydrobiopterin:oxygen oxidoreductase (5-hydroxylating); *other name*: tryptophan oxygenase. An enzyme that catalyses a reaction between dioxygen, L-tryptophan, and tetrahydrobiopterin to form 5-hydroxy-L-tryptophan, dihydrobiopterin, and water. This is the rate-limiting enzyme in the biosynthesis of the neurotransmitter **serotonin (5-hydroxytryptamine)**.

tryptophanium tryptophan cation; the cation, (C₈H₆N)CH₂-CH(NH₃⁺)-COOH, derived from **tryptophan**.

tryptophan 2-monoxygenase EC 1.13.12.3; *systematic name*: L-tryptophan:oxygen 2-oxidoreductase (decarboxylating); *other name*: tryptophan oxygenase. An enzyme that catalyses a reaction between dioxygen and L-tryptophan to form indole-3-acetamide, CO₂, and water. This is the first step in **auxin** biosynthesis.

tryptophan 5-monoxygenase the recommended name for **tryptophan 5-hydroxylase**.

tryptophano the alkylamino group, (C₈H₆N)CH₂-CH(COOH)-NH-, derived from **tryptophan**.

tryptophanol 3-(2-amino-3-hydroxypropyl)indole; 2-amino-3-(1H-indol-3-yl)propanol; (C₈H₆N)CH₂-CH(NH₂)-CH₂OH; the α -amino-alcohol analogue of **tryptophan**.

tryptophan oxygenase an alternative name for **1 tryptophan 2,3-dioxygenase**. **2 tryptophan 2-monoxygenase**. **3 tryptophan 5-hydroxylase**. **tryptophan pyrrolase** an alternative name for **tryptophan 2,3-dioxygenase**.

tryptophan repressor see **trp**.

tryptophan synthase see **trp**.

tryptophan tryptophylquinone *abbr.*: TTQ; a quinoprotein cofactor of methylamine dehydrogenase, EC 1.4.99.3, an enzyme of methylotrophic bacteria. TTQ consists of a tryptophanyl side-chain cross-linked to the tryptophyl 6,7-dione side-chain of a modified tryptophan residue.

tryptophyl the acyl group, (C₈H₆N)CH₂-CH(NH₂)-CO-, derived from **tryptophan**.

TSE *abbr.* for transmissible spongiform encephalopathy.

TSF *abbr.* for thymocyte-stimulating factor, i.e. **interleukin 2**.

TSH *abbr.* for thyroid-stimulating hormone.

TSS *abbr.* for transcription start site.

TSST-1 *abbr.* for toxic shock syndrome toxin-1.

T state see **T form**.

tTA *abbr.* for tetracycline regulated *trans*-activator. See **Tet-Off**.

TTP *abbr.* for **1** ribosylthymine triphosphate or ribothymidine triphosphate, *common names* for ribosylthymine 5'-triphosphate, ribothymidine 5'-triphosphate, 5'-ribothymidyl triphosphate, thymine riboside 5'-triphosphate. **2** (sometimes) thymidine triphosphate. dTTP is recommended.

TTQ *abbr.* for tryptophan tryptophylquinone; a quinone cofactor produced by post-translational modification of two tryptophan residues in some quinoproteins.

TTSP *abbr.* for type II transmembrane serine protease; any of a class of single-pass transmembrane proteins that have an extracellular C-terminal region containing a serine protease domain. Other domains can also be present. Human examples include **corin** and **enteropeptidase**.

T tubule *abbr.* for transverse tubule; a type of tubule in a muscle fibre that arises as an invagination of the plasma membrane and penetrates the fibre, running mostly transversely among the fibrils and surrounding each of them with a ring. Each ring is shared by adjacent fibrils and the whole forms an intercommunicating system of tubules across the fibre. The function of these tubules is to pass the excitation signal from the muscle cell plasma membrane to the sarcomeres, ensuring rapid and synchronous activation. See also **sarcoplasmic reticulum**.

TTX *abbr.* for tetrodotoxin.

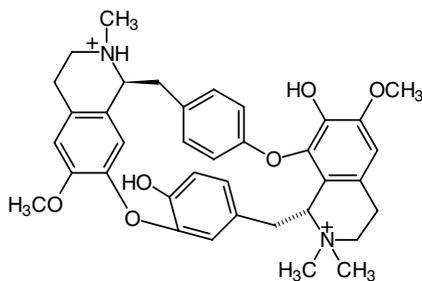

tuberin a protein that is widely expressed and shares a region of homology with GTPase-activating proteins. It forms a largely cytosolic complex with **hamartin**. It may be a tumour suppressor. Many mutations in the gene at 16p13.3 produce tuberous sclerosis type 2 (TSC2). The equivalent gene is inactive in the Eker rat and in the *gigas* mutant of *Drosophila*.

tuberous sclerosis an autosomal dominant multisystem disorder that frequently manifests as seizures, behavioural abnormalities, various skin lesions, and renal tumours and cysts. It is caused by mutations in **tuberin** and in **hamartin**.

tubocurarine (+)-tubocurarine is the active principle of **curare**; it is a nicotinic cholinergic receptor competitive antagonist, and is used as a muscle relaxant. It contains groups that are arranged in space in a rigid framework like the atoms of acetylcholine and are important in its action. It competes with acetylcholine at the neuromuscular junction and causes the endplate potential to fall dramatically.

tubulin a widely distributed globular protein, filaments of which form the structural elements of a **microtubule**. It is a heterodimer of two chains, α and β , each ~50 kDa. The stable form of isolated tubulin is a dimer in which α - β pairing is believed to predominate; such a heterodimer is also the basic component of the microtubule. The dimer binds two molecules of GTP, one at an exchangeable site on the β chain and one at a non-exchangeable site on the α chain. The GTP is hydrolysed to GDP at the plus end more slowly than assembly of heterodimers, to give a GTP cap at that end. GDP-tubulin is disassembled more readily than GTP-tubulin, so the rate of GTP hydrolysis could regulate tubulin assembly. At least 6 isoforms are now known, designated α , β , γ , δ , ϵ , and ζ .

α -tubulin acetylase see **tubulin N-acetyltransferase**.

(+)tubocurarine

tubulin *N*-acetyltransferase EC 2.3.1.108; *other name*: α -tubulin acetylase; an enzyme that catalyses the reaction:

tubuliny-Tyr carboxypeptidase EC 3.4.17.17; *other names*: carboxypeptidase-tubulin; soluble carboxypeptidase; an enzyme that catalyses the cleavage of the Glu-Tyr bond to release the C-terminal tyrosine residue from the native tubulin. It is inactive on carbobenzoxy-Glu-Tyr.

tuftelin or **enamelin** an acidic enamel protein of teeth, with a composition similar to tuft proteins. It is found in association with the crystal component, and secreted at a very early stage of enamel formation in vertebrate teeth.

tuftsin the tetrapeptide Thr-Lys-Pro-Arg, from leukokinin (leukophilic human IgG). It is present in the Fc fragment of IgG, binds to and stimulates the bactericidal, phagocytic, and tumoricidal activities of macrophages and granulocytes, and may also stimulate the migration of polymorphonuclear leukocytes. [After Tufts University, where it was discovered.]

tumble 1 to rotate in a plane vertical to the axis of rotation; 'head over heels'. Proteins and other macromolecules tumble in solution whereas integral membrane proteins rotate on an axis normal to the plane of the membrane but cannot tumble through the membrane surface. **2** in bacterial chemotaxis, to change direction by a rapid reversal of the direction of flagellar rotation, the bacterium then 'tumbling' in response to Brownian motion.

tumor a variant spelling (*esp. US*) of **tumour**.

tumorigenic describing a substance or treatment that has the tendency to cause the formation of a **tumour**.

tumour or (*esp. US*) **tumor** a mass of proliferating cells lacking, to varying degrees, normal growth control. Tumours may be benign, i.e. growing slowly, or malignant, i.e. growing aggressively, invading neighbouring tissues, and spreading to distant parts of the body by releasing cells into the bloodstream or lymph. These cells form secondary tumours (*see metastasis*). *See also adenoma, carcinoma, lymphoma, sarcoma.* —*tumorous or tumoral adj.*

tumour initiator any compound that causes the formation of a tumour.

tumour necrosis factor *abbr.*: TNF; either of two related proteins: TNF- α (*or* cachectin) is produced mainly by monocytes and macrophages, whereas TNF- β (*or* lymphotoxin) is produced by lymphoid cells. They show $\approx 30\%$ sequence homology, bind to the same cell-surface receptors, and exist as homotrimers. They have a multiplicity of actions. In binding to their receptors, present on virtually all cells examined, they activate a large array of cellular genes and also multiple signal-transduction pathways, kinases, and transcription factors. Their genes are single-copy genes, closely linked within the MHC cluster. *See tumour necrosis factor α ; tumour necrosis factor β , tumour necrosis factor receptor.*

tumour necrosis factor α (*abbr.*: TNF- α) or (*formerly*) **cachectin** a **cytokine** that is produced by macrophages, monocytes, endothelial cells, neutrophils, smooth muscle cells, activated lymphocytes, and astrocytes. It is a transmembrane glycoprotein and cytotoxin with a

variety of functions, including the ability to mediate the expression of genes for growth factors, cytokines, transcription factors, and receptors. It can cause cytolysis of certain tumour cell lines, it has been implicated in the induction of cachexia (but *see cachectic factor*), it is a potent pyrogen, causing fever by direct action or by stimulation of interleukin 1 secretion, and it can stimulate cell proliferation and induce cell differentiation under certain conditions. The molecule is a homotrimer. *See also tumour necrosis factor.*

tumour necrosis factor β (*abbr.*: TNF- β) or (*formerly*) **lymphotoxin** a **cytokine** produced by T lymphocytes that is cytotoxic for a wide range of tumour cells. It binds to the same ligands as **tumour necrosis factor α** . *See also tumour necrosis factor.*

tumour necrosis factor receptor *abbr.*: TNF receptor; either of two distinct receptors for **tumour necrosis factor** (TNF), one of M_r 55 000 and the other of 75 000. The two types have related extracellular domains, based on cDNA sequencing, and these are also related to the extracellular domains of nerve growth factor receptor and some other cell-surface molecules. These form a receptor family characterized by four domains with regularly spaced cysteine residues; each has a single transmembrane domain; the intracellular domains show no significant homologies. Either TNF receptor type alone appears sufficient for high-affinity binding and full biological activity, and binds either **tumour necrosis factor α** or **tumour necrosis factor β** with high affinity. The signal transduction mechanism remains speculative, but receptor activation leads to a number of events, including activation of protein kinase C, protein kinase A, phospholipase A_2 , and phosphatidylcholine-specific phospholipase C, and accumulation of cyclic AMP and diacylglycerol.

tumour promoter any compound that sensitizes tissues to the action of a **tumour initiator**, or predisposes tissue to become tumorous in any other way.

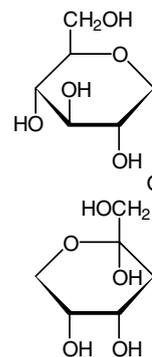

tumour-suppressor gene a normal gene that suppresses tumorigenesis. Certain cancers are associated with mutant tumour-suppressor genes; *see (e.g.) p53, RB.*

TUNEL *abbr* for terminal deoxyribonucleotidyl transferase (TdT)-mediated dUTP nick end labelling. A method of labelling cleaved DNA molecules by enzymically attaching a 2'-deoxyuridylyl tag to the 3' end and detecting it with a fluorescent antibody. Used for recognizing apoptosis *in situ*.

tunnel effect the phenomenon in which an electron or a proton, because of its small mass, does not behave kinetically according to the laws of classical mechanics. These particles can sometimes penetrate an energy barrier that is greater than their kinetic energy.

turacin *see tetrapyrrole.*

turanose 3-*O*- α -D-glucopyranosyl-D-fructose; an early product of the acid hydrolysis of **melezitose**.

turbid (of a solution) opaque due to the presence of suspended particles. —*turbidity n.*

turbidimeter an instrument for measuring the degree to which turbidity hinders the passage of light through a solution.

turbidimetry the quantitative determination of the concentration of substances in suspension by measurement of the decrease in light transmission caused by the suspended particles. *Compare nephelometry.*

Turcot syndrome the clinical combination of a primary tumour of the central nervous system and multiple colorectal adenomas or familial predisposition to colorectal cancer. It is associated with germline mutations in *APC*, in *mutL* homologue 1 (*hMLH1*), or in postmeiotic segregation homologue 2 (*hPMS2*). [After Jacques Turcot (1914–), Canadian surgeon.]

turnaround sequence (in DNA) a sequence of nucleotides between two **inverted repeats**. A turnaround sequence will cause a 'bubble' of noncomplementary nucleotides at one end of a **hairpin**.

Turner syndrome a chromosomal abnormality in females characterized by inheritance of only one X chromosome, or one normal X chromosome and one with a structural abnormality. The frequency in liveborn girls is about 1/5000. The syndrome is associated with short stature, webbing of the neck, a failure to menstruate, and infertility. [After Henry H. Turner (1892–1970), US endocrinologist.]

turnover number an obsolete expression of enzymic activity, variously defined on different occasions as the number of substrate molecules converted to product per catalytic site per minute, or as the number of moles of substrate converted per mole of enzyme per minute or second; it has the dimension of reciprocal time. *Compare catalytic constant, katal.*

turret a multiple cuvette holder that rotates in a spectrophotometer.

T-vector cloning a method for cloning polymerase chain reaction (PCR) products that depends on the addition of deoxyadenosine to the 3' ends of the products by the terminal transferase activity of **Taq polymerase**. Vectors with single dideoxythymidine residues at the 3' ends of the linearized vector form AT base pairs with the PCR products and are ligated efficiently before bacterial transformation and cloning.

Tween the proprietary name for a series of surfactants based on polyoxyethylene sorbitan esters. For example, Tween 20 is polyoxyethylene sorbitanmonolaurate (CMC 0.059 mM). Similarly the sorbitan moiety in other Tweens is: Tween 40, sorbitanmonopalmitate; Tween 60, sorbitanmonostearate; Tween 65, sorbitantristearate; Tween 80, sorbitanmonooleate (aggregation number 58, CMC 0.012 mM); Tween 85, sorbitantrioleate.

twilight zone a region of identity (~0–20%) within which sequence alignments appear plausible to the eye but are not statistically significant (i.e. the same alignment could have arisen by chance). *Compare midnight zone.*

twin-arginine a motif, consensus sequence SRRXFLK, found in the signal peptides for certain proteins, that is required for transport of the protein in the folded state, complete with cofactors, by the **tat** complex. Transport of the protein is driven by the membrane potential.

Twinkle a mammalian mitochondrial protein, similar to the primase/helicase of bacteriophage T7, that is required for integrity of the mitochondrial genome. Mutations in humans cause autosomal dominant progressive external ophthalmoplegia (*abbr.*: PEO).

twist a *Drosophila* gene for a *myc* family homodimeric **helix-turn-helix** transcription factor involved in the establishment of germ layers.

TWIST the human orthologue (202 amino acids) of *twist* protein (490 amino acids) of *Drosophila*. It is a basic helix-loop-helix transcription factor. *twist* protein induces myogenesis during development. Mutations in TWIST cause **Saethre–Chotzen syndrome**.

twist conformation 1 a median conformation of a nonplanar, six-membered, saturated ring compound through which one **boat conformation** passes during conversion into another boat conformation, or through which a boat conformation passes during conversion into a **chair conformation** or vice versa. It is similar to **skew conformation** (def. 1). **2** any conformation of the five-membered ring form of a monosaccharide or monosaccharide derivative when three adjacent ring atoms are coplanar and the other two lie on opposite sides of the plane. The conformational descriptor *-T* may be added to the name of such a compound. *See also conformation.*

twist number or **twisting number** *symbol*: T; the total number of base pairs in a DNA molecule divided by the number of bases per turn of the double helix. It is one of the properties that identifies **topological isomers** of DNA. *See also linking number, writhing number.*

twitchin the protein product of *unc-22*, one of about 40 genes important for muscle assembly and function in the nematode, *Caenorhabditis elegans*. Twitchin is a giant myosin-associated pro-

tein (*compare titin*) that is autophosphorylated on threonine; it contains repeats that are similar to **fibronectin** type III. The protein was named for a mutation that results in twitching. It has a counterpart in *Aplysia californica*, and presumably other invertebrates.

two-carbon fragment 1 any group of atoms containing two carbon atoms. **2** a metabolically active acetyl radical, as in acetyl coenzyme A.

two-component regulatory system one of the signal transduction systems in microorganisms and plants that consists of a membrane **sensor kinase** (SK) and a cognate response regulator (RR). Such systems respond to different types of environmental signal by autophosphorylation of a conserved histidine residue in SK and subsequent transfer to aspartate in RR, which then activates transcription of target genes.

two-component signal transduction a system used by bacteria and lower eukaryotes to adapt to the prevailing environmental and nutrition conditions. A typical system comprises a sensor **histidine kinase** and a cognate **response regulator**. In response to a particular stimulus, the activated sensor kinase phosphorylates its cognate response regulator. This activated response regulator then effects changes in gene expression.

two-dimensional chromatography a chromatographic method in which separation is first effected in one direction and, after rotation of the chromatogram through 90°, then in a second direction, often with a different solvent (or a different pH). **Two-dimensional electrophoresis** works on the same principle.

two-dimensional polymer a macromolecular structure in which approximately parallel chains extending in one direction are cross-linked by another series of approximately parallel chains extending in a second direction. Bacterial cell-wall peptidoglycans are two-dimensional polymers, with glycan chains extending in one direction, cross-linked to peptide chains.

TXA *abbr.* for thromboxane A (*see thromboxane*).

TXB *abbr.* for thromboxane B (*see thromboxane*).

Tylenol *see acetaminophen.*

Tylosin a **macrolide** class antibiotic, similar to **erythromycin**, used in animal feeds and in studies on the structure of **ribosomes**.

tyndallization or **tyndallisation** a method of sterilization in which the sample is heated at 80–100°C on successive days so as to kill cells on each occasion, but to allow spores (which are not killed by heating) to produce susceptible cells during the intervening periods of incubation. [After John Tyndall (1820–93), British natural philosopher, alpinist, and popularizer of science.]

type 1,2,3 copper different classes of copper-binding sites in proteins. In type 1, or blue copper centres, the copper is coordinated to at least two imidazole nitrogens from histidine and one sulfur from cysteine. They are characterized by small copper hyperfine couplings and a strong visible absorption in the Cu(II) state. In type 2, or non-blue copper sites, the copper is mainly bound to imidazole nitrogens from histidine. Type 3 copper centres comprise two spin-coupled copper ions, bound to imidazole nitrogens.

type III system a protein secretory system found in Gram-negative bacteria that is responsible for the secretion of **Yop** proteins. The system is known as type III because it was the third type of secretory system found in the membrane of Gram-negative bacteria.

type II transmembrane serine protease *see* **TSPP**.

typing (*in immunology*) the identification of the classes of histocompatibility antigens, blood groups, or other surface markers present in a sample of serum, or on white blood cells or red blood cells.

Tyr *symbol* for a residue of the α -amino acid L-tyrosine (alternative to Y).

tyramine tyrosamine; *p*-(β -aminoethyl)phenol; 2-(4-hydroxyphenyl)ethylamine; a biogenic amine with adrenergic action, formed by enzymic decarboxylation of tyrosine. It is widespread in mammalian tissues, found in several plant species and in **ergot**, and is a product of microbial action in the intestine, in the putrefaction of animal tissue, and in the ripening of cheese.

Tyr(I₂) or (if the context does not imply the locants) **Tyr(3,5-I₂)** *symbol* for a residue of the α -amino acid 3,5-diiodo-L-tyrosine (*see diiodotyrosine*).

tyrocidine or **tyrocidin** any peptide antibiotic produced by *Bacillus brevis* that is a cyclic decapeptide. The structure of tyrocidine A is

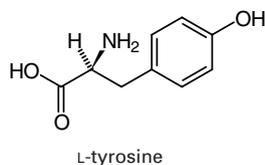

(amino acids are L unless otherwise stated) cyclic -Leu-D-Phe-Pro-Phe-D-Phe-Asn-Gln-Tyr-Val-Orn-. Tyrocidine B has L-Tyr in place of L-Phe, and in tyrocidine C D-Trp replaces the D-Phe attached to the Asn. They are similar in structure and action to **gramicidin S**, increasing the permeability of bacterial membranes, promoting leakage of cytoplasmic constituents, and permitting entry of ions larger than those normally transported. *Bacillus brevis* is immune from this action. They have little application in medicine. Biosynthesis is independent of ribosomes (*see* **protein and peptide biosynthesis**).

Tyrode's solution or **Tyrode solution** or **Ringer-Tyrode solution** a balanced salt solution modified from **Locke's solution**, initially for experiments on mammalian intestine. The solution usually contains (in g L⁻¹, approx.): NaCl (8.0); KCl (0.2); MgCl₂·6H₂O (0.1); CaCl₂ (anhydrous, 0.2); NaHCO₃ (0.1); NaH₂PO₄·H₂O (0.05); and glucose (1.0). [After Maurice Vejeux Tyrode (1878–1930), US pharmacologist, who devised this solution in 1910.]

tyrosinase 1 an alternative name for **monophenol monooxygenase**. **2 β-tyrosinase** EC 4.1.99.2; *recommended name*: tyrosine phenol-lyase; an enzyme that catalyses a reaction between L-tyrosine and water to form phenol, pyruvate, and NH₃. Pyridoxal-phosphate is a coenzyme. The protein contains copper and is a homotetramer, similar to **tryptophanase** (def. 1).

tyrosinate 1 tyrosinate(1-); tyrosine monoanion. In theory, the term denotes any ion, or mixture of ions, formed from **tyrosine**, and having a net charge of -1, although the species HO-C₆H₄-CH₂-CH(NH₂)-COO⁻ predominates in practice. **2** the *systematic name* for tyrosinate(2-); tyrosine dianion; ⁻O-C₆H₄-CH₂-CH(NH₂)-COO⁻. **3** any salt containing an anion of tyrosine. **4** any ester of tyrosine.

tyrosine the *trivial name* for β-(*p*-hydroxyphenyl)alanine; α-amino-*p*-hydroxyhydrocinnamic acid; α-amino-β-(*p*-hydroxyphenyl) propionic acid; 3-(4-hydroxyphenyl)alanine; 2-amino-3-(4-hydroxyphenyl)propanoic acid; HO-C₆H₄-CH₂-CH(NH₂)-COOH; a chiral α-amino acid. L-Tyrosine (*symbol*: Y or Tyr), (S)-2-amino-3-(4-hydroxyphenyl)propanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: UAC or UAU. In mammals, it is an essential dietary amino acid, and is both glucogenic and ketogenic. One residue per molecule of D-tyrosine (*symbol*: D-Tyr or D-Tyr), (R)-2-amino-3-(4-hydroxyphenyl)propanoic acid, occurs as its *O*-methyl ether in the antibiotic cycloheptamycin.

tyrosine decarboxylase EC 4.1.1.25; an enzyme that catalyses the decarboxylation of L-tyrosine to **tyramine**. Pyridoxal-phosphate is a coenzyme.

tyrosine hydroxylase EC 1.14.16.2; *recommended name*: tyrosine 3-monooxygenase; *systematic name*: L-tyrosine, tetrahydrobiopterin:oxygen oxidoreductase. An enzyme that catalyses a reaction between dioxygen, L-tyrosine, and tetrahydrobiopterin to form 3,4-dihydroxy-L-phenylalanine, dihydrobiopterin, and water; it requires ferric ion. It is the rate-limiting enzyme in the synthesis of **catecholamine** neurotransmitters. In humans four types are produced by alternative splicing. *See* **DOPA-responsive dystonia**.

tyrosine kinase EC 2.7.1.112; *recommended name*: protein-tyrosine kinase; *other names*: tyrosylprotein kinase; protein kinase (tyro-

sine); hydroxyaryl-protein kinase. An enzyme that transfers the terminal phosphate of ATP to a specific tyrosine residue on its target protein; i.e. it catalyses the phosphorylation by ATP of protein-tyrosine to form protein-tyrosine phosphate with release of ADP. The enzyme molecule has five motifs. The tyrosine kinase family is of profound importance due to its involvement in the signalling processes associated with mitogenic stimulation, cell growth, and oncogenesis. The tyrosine kinases fall into two major classes, those that are cell membrane receptors and integral membrane proteins, and those that are intracellular and function downstream of the receptors. The membrane receptors have been grouped into subclasses according to their structure (all individual polypeptides have a single transmembrane domain, with the kinase activity in an intracellular domain); examples include subclass I, proteins having two cysteine-rich repeat sequences in the extracellular domain of a monomeric receptor, a group that includes the **epidermal growth factor receptor**; subclass II, disulfide-linked heterotetrameric α₂β₂ structures with extracellular cysteine-rich repeat sequences similar to subclass I, an example being the **insulin receptor**; subclass III, proteins with five immunoglobulin-like repeats in the extracellular domain, and with a non-kinase insert in the kinase region, typified by the **platelet-derived growth factor receptor**; and subclass IV, proteins with three immunoglobulin-like repeats in the extracellular domain, with a non-kinase insert in the kinase region. This classification continues to be extended. The intracellular non-receptor tyrosine kinases include, among many, the products of **FGR**, **FYN**, and **src**. *See also* **protein kinase**.

tyrosine 3-monooxygenase the *recommended name* for **tyrosine hydroxylase**.

tyrosine transaminase or **tyrosine aminotransferase** (*abbr.*: TAT) EC 2.6.1.5; *systematic name*: L-tyrosine:2-oxoglutarate aminotransferase; an enzyme that catalyses the reaction:

It is a pyridoxal-phosphate enzyme and it catalyses the first step in tyrosine catabolism; defects lead to tyrosinemia type II (**Richner-Ranhart syndrome**).

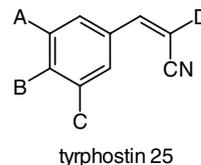

tyrosinium tyrosine cation; the cation, HO-C₆H₄-CH₂-CH(NH₃⁺)-COOH, derived from **tyrosine**.

tyrosino the alkylamino group, HO-C₆H₄-CH₂-CH(COOH)-NH-, derived from **tyrosine**.

tyrosin-O⁴-yl the aryloxy group, HOOC-CH(NH₂)-CH₂-C₆H₄-O-, derived from **tyrosine**.

tyrosyl the acyl group, HO-C₆H₄-CH₂-CH(NH₂)-CO-, derived from **tyrosine**.

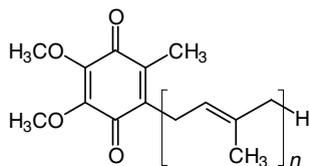

tyrphostin any inhibitor of protein-tyrosine kinases derived from the substituted benzylidenemalononitrile, shown as the core structure; A, B, and C can be -NO₂, (CH₃)₃C-, -OH, or -H. In tyrphostin 25, [(3,4,5-trihydroxyphenyl)-methylene]-propanedinitrile, D is -CN. Some tyrphostins uncouple oxidative phosphorylation and inhibit lipoxigenases.

tyvelose the aldohexose 3,6-dideoxy-D-mannose, 3,6-dideoxy-D-arabino-hexose, a monosaccharide of various lipopolysaccharides produced by some Gram-negative bacteria, e.g. certain serotypes of *Salmonella typhi*, where it contributes to the antigenic specificity of the organism's O antigens. The L-enantiomer is called **ascarylose**.

Uu

- u** 1 symbol for unified atomic mass unit. 2 see **IU**.
- u** symbol for 1 speed (alternative to *v*, *w*, or *c*). 2 (bold italic) velocity (alternative to *v*, *w*, or *c*).
- U** symbol for 1 a residue of the base uracil in a nucleic-acid sequence. 2 a residue of the ribonucleoside uridine (alternative to Urd). 3 uniformly labelled. 4 enzyme unit (obsolete; superseded by **katal**). 5 uranium.
- U** symbol for 1 electric potential difference (alternative to ΔV or $\Delta\phi$). 2 internal energy.
- U46619** a stable thromboxane A₂ analogue and mimetic; another name for **9,11-dideoxy-11 α ,9 α -epoxymethanoprostaglandin F_{2a}**.
- U937** a cell line derived from a patient with histiocytic lymphoma.
- UAA** a codon in mRNA for chain termination; the **ochre codon**.
- UAC** a codon in mRNA for L-tyrosine.
- UAG** a codon in mRNA for chain termination; the **amber codon**.
- UAS** *abbr.* for upstream activator sequence; the counterpart in yeast of an **enhancer**.
- UAU** a codon in mRNA for L-tyrosine.
- Ubbelohde viscometer** *see* **capillary viscometer**.
- UBE3A** symbol for a gene encoding ubiquitin protein ligase E3A, which functions by attaching the small protein ubiquitin to proteins targeted for degradation within proteasomes. Mutations in the gene are responsible for some cases of Angelman syndrome. The paternal allele is imprinted.
- UBIP** *abbr.* for ubiquitous immunopoietic polypeptide.
- ubiquilin** a protein that binds to **presenilins**, promotes their accumulation, and appears to increase their synthesis. It is related to ubiquitin in structure, and like ubiquitin is present in the neuropathological lesions characteristic of Alzheimer's disease (neurofibrillary tangles) and Parkinson's disease (Lewy bodies). The responsible gene maps to a region thought to contain a gene for late-onset Alzheimer's disease.
- ubiquinol** *abbr.*: QH₂; reduced **ubiquinone**.
- ubiquinol-cytochrome c reductase** EC 1.10.2.2; *systematic name*: ubiquinol:ferricytochrome-*c* oxidoreductase; *other name*: complex III. An enzyme complex that catalyses the oxidation of ubiquinol by two molecules of ferricytochrome *c* to form ubiquinone and two molecules of ferrocyclochrome *c*. It contains cytochromes *b*₅₆₂, *b*₅₆₆, and *c*₁, and a Rieske iron-sulfur protein.
- ubiquinone** or (formerly) **coenzyme Q** *abbr.*: Q; a lipid-soluble electron-transporting coenzyme that is an essential component in the **respiratory chain**. The structure is shown below; *n* has values from 6 to about 12, as indicated by the abbreviation Q_{*n*}. Ubiquinone is synthesized in mammals from tyrosine, and in bacteria and other organisms by the **shikimate pathway**. *See also* **protonmotive Q cycle**.

- ubiquinone reductase** *see* **NADH dehydrogenase (ubiquinone)**.
- ubiquitin** 1 a small, highly conserved, heat-stable protein of 76 amino-acid residues, first isolated from bovine thymus, but subsequently found in the cells of all tissues studied, in animals, yeast, bacteria, and higher plants. Located in both nuclei and cytoplasm, it derives its name from its widespread distribution. It undergoes an ATP-dependent reaction with proteins that results in condensation of its terminus with lysine amino groups; this process is mediated by a large multiprotein complex, the 26S **proteasome**. For example, cyclin degradation in the control of the cell cycle is triggered by ubiquitination.

Thus, the cell has two means of protein degradation: ubiquitination and proteolysis in lysosomes. Such modified proteins are degraded rapidly. Ubiquitin is synthesized as a polyubiquitin precursor, with exact head-to-tail repeats, the number of repeats differing between species. In some species, there is a final amino acid after the last repeat (e.g., Val in human). Some ubiquitin genes encode a single copy of ubiquitin fused to a ribosomal protein. The following sequence is conserved in numerous species:

MQIFVKTLTGKITLEVEPSDTIENVKAKIQDKEGIP-
PDQQLIFAGKQLEDGRTLSDYNIQKESTLHLVLRIRGG.

2 a former name for **ubiquitous immunopoietic polypeptide**.

ubiquitin-activating enzyme E1 an enzyme that activates ubiquitin by first adenylating, with ATP as co-substrate, its C-terminal glycine residue and thereafter linking this to itself via the side chain of a cysteine residue, releasing AMP. The protein is a monomer and can accommodate two ubiquitin molecules.

ubiquitination *see* **ubiquitin** (def. 1).

ubiquitin-conjugating enzyme E2 or **ubiquitin-carrier protein** an enzyme that accepts the ubiquitin attached to **ubiquitin-activating enzyme E1** and, with **ubiquitin-protein ligase E3**, transfers it to the acceptor protein. Numerous isoforms exist within a species, with specificity for an E3 isozyme and an acceptor protein. Some E2 isoforms transfer the ubiquitin directly to the acceptor protein without the need for E3.

ubiquitin-protein ligase E3 EC 6.3.2.19; *other names*: ubiquitin-conjugating enzyme; ubiquitin-activating enzyme; an enzyme that couples ubiquitin to a protein lysine to form protein N-ubiquityllysine with hydrolysis of ATP to ADP and pyrophosphate. Several isozymes with specificity for an E2 and the acceptor protein exist with a species.

ubiquitous immunopoietic polypeptide *abbr.*: UBIP; a polypeptide that has lymphocyte-differentiating properties, and can stimulate adenylate cyclase. It is involved in maintenance of chromatin structure, regulation of gene expression, stress response, and ribosome biogenesis. It was formerly called ubiquitin. *See also* **proteasome**.

Ubl protein *abbr.* for ubiquitin-like protein. *See* **SUMO**

UCA a codon in mRNA for L-serine.

UCC a codon in mRNA for L-serine.

UCG a codon in mRNA for L-serine.

UCP *abbr.* for brown fat uncoupling protein.

UCU a codon in mRNA for L-serine.

Udo symbol for the undecanoyl group, CH₃-[CH₂]₉-CO-.

UDP *abbr.* for uridine (5'-)diphosphate.

UDP-N-acetylglucosamine 6-dehydrogenase EC 1.1.1.136; an enzyme that catalyses the reaction:

UDP-N-acetylglucosamine-dolichyl-phosphate-N-acetylglucosamine phosphotransferase EC 2.7.8.15; an enzyme that catalyses a reaction between UDP-N-acetyl-D-glucosamine and dolichyl phosphate to form N-acetyl-D-glucosaminyl-diphosphodolichol and UMP. This is the first reaction in the synthesis of oligosaccharide lipids.

UDP-N-acetylglucosamine 2-epimerase EC 5.1.3.14; an enzyme that catalyses the reaction:

This is the initial reaction in the synthesis of sialic acid, and the enzyme is allosterically inhibited by CMP-sialic acid. The activity resides in the N-terminal 416 residues of the bifunctional protein (727 amino acids), which has N-acetylmannosamine kinase activity in the C-terminal portion. Mutations that impair binding of the inhibitor to the epimerase portion cause the rare disease sialuria.

UDP-*N*-acetylglucosamine 4-epimerase EC 5.1.3.7; an enzyme that catalyses the reaction:

UDPG *abbr.* for uridinediphosphoglucose; UDPGlc is preferred (to avoid possible ambiguity in context with galactose).

UDPGal or **UDPGalactose** *abbr.* for uridinediphosphogalactose.

UDPGalactose 4-epimerase *abbr.*: GALE; *an alternative name for* UDPglucose 4-epimerase.

UDPGlc (*preferred*) *abbr.* for uridinediphosphoglucose; *see also* UDPG.

UDPglucose 6-dehydrogenase EC 1.1.1.22; an enzyme that catalyses the reaction:

UDPglucose 4-epimerase *the recommended name and systematic name for* the isomerase EC 5.1.3.2; *other names*: UDPgalactose 4-epimerase; (*abbr.*: GALE); (*formerly*) galactowaldenase; an enzyme that interconverts uridinediphosphoglucose and uridinediphosphogalactose. The mechanism involves oxidation of the C-4 hydroxyl group of the hexose moiety of either uridinediphosphoglucose to an oxo group by a tightly bound molecule of NAD⁺; the resultant NADH is then reoxidized by the intermediate oxo derivative with inversion of configuration of the resulting hydrogen and hydroxyl groups at C-4. Mutations that produce enzyme deficiency result in a benign anomaly when it affects only blood cells, or in a severe but rare form of galactosemia when it affects all tissues. The difference may reflect the degree of molecular instability produced by the mutation. The human gene encodes 348 amino acids. *Compare* UDPglucose-hexose-1-phosphate uridylyltransferase.

UDPglucose-hexose-1-phosphate uridylyltransferase EC 2.7.7.12; *systematic name*: UDPglucose:α-D-galactose-1-phosphate uridylyltransferase; *other names*: uridylyltransferase; galactose-1-phosphate uridylyltransferase. An enzyme that interconverts uridinediphosphoglucose and uridinediphosphogalactose. It is important in the metabolism of galactose by catalysing the exchange reaction:

More than 150 mutations cause deficiency of the enzyme, which is associated with a form of **galactosemia**. In *Escherichia coli* the enzyme comprises 890 amino acids (102.31 kDa) and modifies the **nitrogen regulatory protein P_{II}**. *Compare* UDPglucose 4-epimerase.

UDPglucose pyrophosphorylase *an alternative name for* UTP-glucose-1-phosphate uridylyltransferase.

UDPglucuronate 4-epimerase EC 5.1.3.6; an enzyme that catalyses the reaction:

UDPglucuronate 5-epimerase EC 5.1.3.12; an enzyme that catalyses the reaction:

NAD⁺ is a cofactor.

UDPglucuronosyltransferase EC 2.4.1.17; *abbr.*: UDPGT or UGT; *recommended name*: glucuronosyltransferase; an enzyme involved in the formation of **glucuronosides**. It catalyses a reaction between UDPglucuronate and an acceptor to form UDP and acceptor β-D-glucuronoside. The numbering of variants uses several systems; the one followed here has UDPGT followed by a number, letter, and sometimes a number, e.g. UDPGT1F, UDPGT2B10. Human examples include: UDPGT1a (bilirubin-specific isozyme 1); UDPGT1b; and UDPGT1c (or UGT13).

UDPGP *abbr.* for UDPglucose pyrophosphorylase (i.e. UTP-glucose-1-phosphate uridylyltransferase).

UGA 1 a codon in nonmitochondrial mRNA for chain termination; the **opal codon**. **2** a codon in mitochondrial mRNA for L-tryptophan.

UGC a codon in mRNA for L-cysteine.

UGG a codon in mitochondrial mRNA, and the only codon in non-mitochondrial mRNA, for L-tryptophan.

UGU a codon in mRNA for L-cysteine.

+ulose *noun suffix* denoting a **ketose**; it may be expanded to **+ulofuranose** or **+ulopyranose** according to whether the cyclic form of the sugar is five-membered or six-membered respectively.

+ulosonic acid *noun suffix* denoting a **ketoaldonic acid**; it may be expanded to **+ulofuranosonic acid** or **+ulopyranosonic acid** according to whether the cyclic form of the sugar acid is five-membered or six-membered respectively.

ultimate carcinogen or **ultimate carcinogenic metabolite** any metabolite of a **chemical carcinogen** that reacts with cellular constituents so as to initiate carcinogenesis. *See also* **proximate carcinogen**.

ultimobranchial body one of a pair of glandlike structures derived from the last branchial (gill) pouches. They occur in all vertebrates except cyclostomes. In most mammals they become embedded in the respective lobes of the thyroid gland, forming **C cells**, which secrete the hormone **calcitonin**.

ultra+ *prefix* **1** beyond in space; on the other side (of). *Compare* **infra+**, **trans+**. **2** beyond a specified (esp. in scientific usage, lower) limit, range, value, etc. *Compare* **super+**. **3** beyond the common, ordinary, natural, etc.; extreme(ly). *Compare* **hyper+**.

ultracentrifuge any centrifuge that operates at high rotational velocities generating high gravitational fields. Ultracentrifuges can be operated at known speeds with small variations and without temperature fluctuations. They may be either analytical or preparative.

ultradian (of a biological activity) occurring less often than once per 24-hour period. *Compare* **circadian**, **infradian**.

ultrafilter a filter of small pore size suitable for **ultrafiltration**.

ultrafiltration a separation process whereby a solute of molecular size significantly greater than that of the solvent molecule is removed from the solvent by the application of a hydraulic pressure, which forces only the solvent to flow through a suitable membrane (usually one having a pore size in the range 0.001–0.1 μm), thereby concentrating the solute.

ultramicrotome a device for preparing very thin sections of cells or tissues, after fixing and embedding or freezing, for inspection in the transmission electron microscope.

ultrasonic of, pertaining to, or producing **ultrasound** waves.

ultrasonication the process of exposing material to **ultrasound**. It is used for cell disruption, for denaturation of proteins, and for cleaning solid surfaces. *See also* **sonicate**.

ultrasonic disintegrator an apparatus for disintegrating cells and other material, or for cleaning solid surfaces, by exposing them to **ultrasound**. *See also* **sonicator**.

ultrasound propagated waves, of the same nature as sound but inaudible, with frequencies of >20 kHz. Frequencies of ≈25 kHz can be used for disintegrating cells and subcellular components and also in cleaning baths for the removal of deposits on a wide variety of objects. In physiotherapy the range of 0.5–3 MHz is used for the relief of painful muscles by producing warmth and by changing the permeability of cell membranes, which allows for the removal of fluid. For diagnostic purposes the range of 3–12 MHz is commonly used and is a popular method of non-invasive imaging, e.g. in pregnant women. There is also ultrasonic microscopy, which mimics light microscopy and employs sound in the GHz range. Ultrasound is also being developed for the disintegration of tumours.

Ultraspiracle *abbr.*: USP; a nuclear hormone receptor of *Drosophila* that forms heterodimers with the ecdysteroid receptor and with *Drosophila* hormone receptor 38 (DHR38).

ultrastructure the fine structure of an organ, tissue, cell, or subcellular particle, especially that demonstrable with an electron microscope.

ultraviolet (radiation) *abbr.*: UV or uv; electromagnetic radiation of wavelengths in the range 13.6–400 nm (frequencies 750 THz–22.1 PHz). This range overlaps the wavelengths of soft X-radiation and ends just across the short-wavelength limit of visible light. Ultraviolet radiation is often divided into **near ultraviolet** (200–400 nm) and **far ultraviolet** (or **vacuum ultraviolet**) (<200 nm);

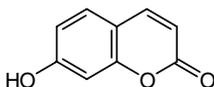

radiation in the far ultraviolet is absorbed by O₂ and requires the use of evacuated apparatus or flushing with N₂.

ultraviolet-endonuclease an enzyme involved in the repair of ultraviolet-irradiated DNA in microorganisms. *See also* **deoxyribonuclease (pyrimidine dimer)**, **uvr**.

ultraviolet reactivation *see* **W reactivation**.

Ultrogel the proprietary name for a range of bead-form rigid support materials used in **gel filtration**, **affinity chromatography**, and related procedures. It consists of a lattice of polyacrylamide in a matrix of agarose gel.

umbelliferone 7-hydroxycoumarin; a common component of plant extracts, used as a fluorescent pH indicator and as a fluorescent label.

UML *abbr.* for universal markup language; *see* **markup language**.

UMP *abbr.* for uridine monophosphate; i.e. uridine phosphate.

UMP synthase the combination of enzymes that form uridine 5'-phosphate from orotate: these are **orotate phosphoribosyltransferase** (forming orotidylic acid) and **orotidine 5'-phosphate decarboxylase**. *See also* **uridine-5'-monophosphate synthase**.

umu bacterial genes encoding proteins that are involved in the error-prone **SOS repair** process, probably by allowing bypass synthesis across a damaged template.

un+ prefix **1** (*used with adjectives, adverbs, and nouns*) not; opposite of; contrary to. **2** (*used with verbs*) reversal of an action or state; release; removal from.

unary operator an arithmetic or logical operator (e.g. NOT) that operates on only one variable. *Compare* **binary operator**.

unc-86 a gene of *Caenorhabditis elegans* that encodes a transcription factor containing the **POU domain** and contributes to the naming of the domain.

uncharacterized protein family *abbr.*: UPF; a related group of protein sequences whose function has not been experimentally determined and that shows no similarity to other, functionally characterized, sequences.

uncoating enzyme an enzyme that catalyses the removal of the protein coat from a virus.

uncoded amino acid an alternative term for **noncoded amino acid**.

uncompensated acidosis an **acidosis** in which there is a fall of the blood pH, due to the inadequacy of the physiological compensating mechanisms.

uncompensated alkalosis an **alkalosis** in which there is a rise of the blood pH, due to the inadequacy of the physiological compensating mechanisms.

uncompetitive inhibition the inhibition of an enzyme system when the inhibitor does not combine with the free enzyme, but only with one of the enzyme-substrate intermediates.

unconventional myosin any of about 14 isoforms of muscle **myosin** (myosin II) that function as motor proteins and are also found in many nonmuscle cell types. Each consists of a globular head (an actin-activated ATPase) and a short tail (which binds membranes including those of organelles and vesicles). Movement of the head over actin microfilaments is responsible for cytokinesis, cytoplasmic streaming, and axonal transport. **Myosin I** is present in most nonmuscle cells. **Myosin Va** is responsible for transport of melanosomes in pigment cells and of vesicles in neurons. Mutations in its gene at 15q21 are associated with Griscelli syndrome (hypopigmentation of skin and hair and immunological deficiency). **Myosin VIIa** is a protein of 2215 amino acids. Some mutations in its gene at 11q13.5 are associated with a form of familial nonsyndromic deafness, whereas others result in Usher syndrome type I (congenital deafness with vestibular dysfunction and retinitis pigmentosa). **Myosin XV** is 3530 amino acids long and present in the sensory cells of the inner ear. Mutations in its gene at 17p11.2 result in a form of familial nonsyndromic deafness.

uncoupled 1 disconnected; unfastened. **2** (*in biochemistry*) describing an organism, tissue, cell, or mitochondrion in which phosphorylation is dissociated from oxidation in the **respiratory chain**. *See also* **uncoupling**.

uncoupler an alternative name for uncoupling agent (*see* **uncoupling**).

uncoupling (*in biochemistry*) the dissociation of phosphorylation from oxidation in the **respiratory chain**, so that electron transport proceeds without the esterification of phosphate and without the need for inorganic phosphate. An **uncoupling agent** (*or* uncoupler) is a substance that causes uncoupling of phosphorylation from electron transport at one or more points in the electron-transport chain. A classical example is **dinitrophenol**. Uncoupling agents probably act by causing leakage of protons across the mitochondrial inner membrane thereby destroying the proton gradient that drives oxidative phosphorylation. *See also* **chemiosmotic coupling hypothesis**.

uncoupling protein *see* **brown fat uncoupling protein**.

undec+ *or* **undeca+** prefix denoting eleven.

undecaprenol *or* **bactoprenol** a polyunsaturated long-chain (C₅₅) primary alcohol containing 11 **prenyl** units.

undecaprenyl phosphate *or* **undecaprenol phosphate** a very hydrophobic phosphate ester of **undecaprenol**. It acts as a membrane-soluble carrier to which intermediates are combined in the course of the biosynthesis of bacterial cell-envelope components, e.g. peptidoglycan and lipopolysaccharide. *Other names*: bactoprenyl phosphate; carrier lipid; C₅₅ carrier lipid; C₅₅ lipid carrier.

underivatized *or* **underivatised** (of a substance) in the naturally occurring state.

undulin a non-collagenous glycoprotein of the interstitial extracellular matrix, associated with collagen. Isolated from skin or placenta, it is found mainly between densely packed mature collagen fibrils as bundles of uniform wavy fibres. It is a member of the fibronectin-tenascin family, and is related to collagen type XIV. It is associated with dense collagen matrices in soft tissues, and is likely to be involved in the supramolecular organization of interstitial collagens. Human undulin 2 shares sequence similarity with fibronectin type III.

ung *see* **uracil-DNA N-glycosylase**.

Uni *see* **reactancy of enzymes**.

uni+ *comb. form* consisting of, having, or relating to one.

unicode a set of characters that, unlike **ASCII**, occupy 16 bits and can therefore encode many different alphabets.

unidentified reading frame *abbr.*: URF; an open reading frame that encodes a protein of unknown function.

unified atomic mass unit *or* (*formerly*) **atomic mass unit** (*abbr.*: amu *or* a.m.u.) *symbol*: u; a non-SI unit of mass equal to one-twelfth of the mass of one atom of carbon-12; i.e.

$$1 \text{ u} = m_{\text{a}}(^{12}\text{C})/12 \approx 1.660\,540 \times 10^{-27} \text{ kg.}$$

It is identical with **dalton**.

uniformly labelled *symbol*: U; describing a **labelled compound** in which the label is distributed in a statistically uniform, or nearly uniform, manner between all the possible positions in the molecule.

UniGene *see* **cluster database**.

unimolecular reaction *see* **molecularity**.

uniparental disomy the inheritance of two copies of a chromosome from one parent.

uniport a membrane transport process in which a single kind of substrate (ion or uncharged molecule) is transported across the membrane, either by the mechanism of mediated diffusion where the substrate equilibrates at the two membrane sides (e.g., monosaccharides in mammalian erythrocytes; TC 2.A.1.1.12), or by active transport where an external source of energy is used to achieve movement against a chemical potential or an electrochemical potential gradient (e.g., plasma membrane H⁺-transporting ATPase TC 3.A.3.3.1 or EC 3.6.3.6). Such transport systems may be designated as **uniporters**.

UniProt *abbr.* for universal protein sequence database; *see* **composite database**.

unique (sequence) DNA *or* **single-copy DNA** any unique and specifically ordered nucleotide sequence in DNA that occurs only once in a genome. *Compare* **repetitive sequences**.

unitary matrix an alternative name for identity matrix. See **scoring matrix**.

unit cell the smallest portion of a crystal that, by translation in three dimensions, is able to account for the structure of the entire crystal. The array of unit cells, arranged along parallel straight lines, makes up the **crystal lattice**.

unit membrane or **double membrane** or **triple membrane** any membrane, irrespective of cellular location, that on staining with osmium or other heavy metals appears in section in the electron microscope as a pair of parallel dark lines separated by a less dense layer, the whole being 6–10 nm thick. Unit membranes include the plasma membrane and the membranes of organelles such as mitochondria, nuclei, and endoplasmic reticulum.

unit of replication see **replicon**.

unit of transcription see **transcriptional unit**.

univalent 1 or **monovalent** (of a chemical species) having a **valency** of one. **2** an unpaired chromosome seen during meiosis when bivalents are also present. Such a chromosome either lacks a homologue or results from **asynapsis**. —**univalency** *n*.

UniVec see **vector database**.

universal buffer mixture any solution containing several buffering systems chosen so as to provide a relatively high buffer capacity over a wide pH range.

universal donor an individual with O-type blood; such blood may be transfused into any recipient. See **ABO system**.

universal primers oligonucleotides used as primers in DNA sequencing reactions that are specific for plasmid sequences flanking the cloned DNA insert. Because sequences such as the T3, T7, or SP6 promoters are commonly used in this position, primers annealing to them can be used to obtain sequences of inserts cloned in a variety of vectors.

universal recipient an individual with AB-type blood; such individuals may be transfused with blood from any donor. See **ABO system**.

unmediated transport or **nonmediated transport** the movement of a solute across a barrier by **diffusion** (def. 1).

unpaired electron an electron in an atom or molecule whose spin is not paired with the oppositely directed spin of another electron in the same atom or molecule. Only systems containing unpaired electrons will give an electron spin resonance signal. See **electron spin resonance spectroscopy**.

unrooted tree a **phylogenetic tree** in which the evolutionary ancestor is unknown.

unsaponifiable lipid or **unsaponifiable material** part of a lipid sample that is not solubilized by **saponification**. It consists principally of steroids and terpenes.

unsaturated 1 (of a solution) able to dissolve more of the solute in question. **2** (of an organic compound) containing double bonds; see also **polyunsaturated**. **3** (of any chemical system, e.g. an enzyme or antibody) not fully saturated with ligand (e.g. substrate or antigen).

unsaturated-fatty-acid oxidation the degradation of unsaturated fatty acids to CO₂ and H₂O; this is achieved largely by enzymes of the **beta-oxidation system**, but enzymes specific for unsaturated fatty acids are also required. Thus, when beta-oxidation reactions have removed carbons to the point at which the resulting acyl-CoA molecule has a Δ^3 -*cis* double bond (which is not a substrate for **enoyl-CoA hydratase**), an enoyl-CoA isomerase (see **dodecenoyl-CoA Δ -isomerase**) converts this bond to a Δ^2 -*trans* double bond. Similarly, when an acyl-CoA with a Δ^4 -*cis* double bond is produced, which again is not a substrate for enoyl-CoA hydratase, **2,4-dienoyl-CoA reductase** followed by enoyl-CoA isomerase yield the substrate with a Δ^2 -*trans* double bond.

untranscribed spacer a region of genomic DNA, lying between genes or groups of genes, that is not transcribed. See **spacer** (def. 1).

untranslated region *abbr.*: UTR; any part of an mRNA molecule not coding for a protein; e.g. in eukaryotes the **poly(A) tail**.

unweighted pair-group method with arithmetic averaging *abbr.*: UPGMA; a distance-based, hierarchical clustering method used to create phylogenetic trees under the molecular clock assumption (i.e. assuming constant rates of evolution over different lineages).

unwinding protein or **unwindase** any of the proteins concerned in

DNA replication that have a higher affinity for single-stranded DNA than for double-stranded DNA and hold the strands apart during replication.

UPA *abbr.* for urokinase-type plasminogen activator; see **plasminogen activator**.

UPF *abbr.* for uncharacterized protein family.

UPGMA *abbr.* for unweighted pair-group method with arithmetic averaging.

U5'pp1Gal *symbol* for uridinediphosphogalactose (alternative to UrdPPGal or Urd-5'PP-Gal).

U5'pp1Glc *symbol* for uridinediphosphoglucose (alternative to UrdPPGlc or Urd-5'PP-Glc).

up-promoter a mutation that increases **promoter** strength in the expression of a gene.

up-regulation 1 the process of reducing or suppressing the response of a cell to a stimulus. **2** a process in which the expression of a gene is increased.

upsilon *symbol*: υ (lower case) or Υ (upper case); the twentieth letter of the Greek alphabet.

upstream in or towards positions in a DNA molecule lying in the 5' direction relative to the start of transcription of a gene.

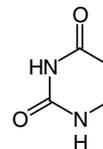

upstream activator sequence a sequence in yeast DNA that is located 5', and a few hundred base pairs from, the transcriptional initiator site of a protein-coding gene. When bound by one or more specific proteins it stimulates transcription of the gene. In higher eukaryotes the same role is played by **enhancers**. See **USA**.

Ur or **UR** *abbr.* for uridine (the symbol Urd is recommended).

Ura *symbol* for a residue of the pyrimidine base **uracil**.

URA3 *symbol* for the gene in *Saccharomyces cerevisiae* for orotidine-5'-phosphate decarboxylase. Null mutants are uracil auxotrophs. Vectors encoding **URA3** can complement yeast strains carrying the *ura3* mutation.

uracil *symbol*: U or Ura ; 2,4-dioxypyrimidine; 2,4-pyrimidinediol; a pyrimidine base occurring in RNA (but not in DNA).

uracil-DNA N-glycosylase an enzyme (sub-subclass EC 3.2.2) that removes from DNA any uracil resulting from misincorporation of dUTP that has escaped the action of dUTPase (EC 3.6.1.23, dUTP pyrophosphatase). The enzyme hydrolyses the bond at C-1 of the deoxyribose to yield free uracil and DNA containing an apyrimidinic site; another enzyme, apyrimidine endonuclease, recognizes this site and cleaves the phosphodiester bond on the 5' side of the deoxyribose moiety. Uracil-DNA N-glycosylase may represent the evolutionary basis for the presence of T (not U) in DNA. Cytosine deamination leads to U residues, which would generate transition mutations on replication. The enzyme is a monomer, and is highly conserved in all species. In *Escherichia coli* it is encoded by the *ung* gene, and mutations in this can be used in certain forced site-directed mutagenesis protocols.

urate oxidase EC 1.7.3.3; *systematic name*: urate:oxygen oxidoreductase; *other name*: uricase. An enzyme that catalyses the reaction: urate + O₂ → intermediate(s) that lead(s) to **allantoin**. It is a conserved peroxisomal copper-containing enzyme. Some mammals (e.g. humans, gorillas) that lack the enzyme are prone to **gout**.

Urd *symbol* for a residue of the ribonucleoside **uridine** (alternative to U).

UrdP *symbol* for any uridine phosphate.

Urd2'P *symbol* for uridine 2'-phosphate.

Urd-2'3'-P *symbol* for uridine 2',3'-phosphate.

Urd3'P *symbol* for uridine 3'-phosphate.

Urd-3'5'-P *symbol* for uridine 3',5'-phosphate.

Urd5'P *symbol* for uridine 5'-phosphate.

Urd5'PP *symbol* for uridine 5'-diphosphate (alternative to ppU).

UrdPPGal or **Urd-5'PP-Gal** *symbol* for uridinediphosphogalactose (alternatives to U5'pp1Gal).

UrdPPGlc or **Urd-5'PP-Glc** *symbol* for uridinediphosphoglucose (alternatives to U5'pp1Glc).

Urd5'PPP *symbol* for uridine 5'-triphosphate (alternative to pppU).

urea the water-soluble compound $\text{H}_2\text{N}-\text{CO}-\text{NH}_2$, produced in the liver via the **ornithine-urea cycle**. It is the main nitrogen-containing (urinary) excretion product in **ureotelic** animals. It is used as a source of nonprotein nitrogen in ruminant livestock feeds.

urea cycle *see* **ornithine-urea cycle**.

urease EC 3.5.1.5; *systematic name*: urea amidohydrolase; a nickel-protein enzyme that catalyses the hydrolysis of urea to carbon dioxide and ammonia. A carbamoylated lysine provides an oxygen ligand to each nickel, thus explaining a requirement for CO_2 as an activator of urease apoenzyme. In *Proteus vulgaris* urease is a dimer of three subunits, probably in two $\alpha\beta_2\gamma_2$ complexes.

urea transporter *abbr.*: UT; any facilitated urea transporter in kidney. In rat kidney, **UT1** (929 amino acids) consists of homologous halves, each containing ten transmembrane segments, and intracellular N- and C-termini. It is present in the collecting duct and is involved in vasopressin-regulated urea resorption. **UT2** is present in the proximal renal tubules, and **UT3** is present in the descending vasa recta.

ureido the $\text{NH}_2-\text{CO}-\text{NH}-$ group, derived from urea by loss of a hydrogen atom.

ureidosuccinase EC 3.5.1.7; an enzyme that hydrolyses *N*-carbamoyl-L-aspartate (ureidosuccinate) to L-aspartate, CO_2 , and NH_3 .

ureogenic describing an organism (or species) that possesses the full complement of **ornithine-urea cycle** enzymes, and that potentially, but not necessarily, can biosynthesize significant amounts of urea.

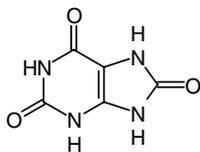

ureosmotic describing an organism (or species) that adjusts urea production or retention so as to maintain osmotic equilibrium, rather than as a means of disposing of surplus nitrogen.

ureotelic describing an organism (or species) in which **urea** is the principal end product of the degradation of nitrogen-containing compounds, e.g. mammals and marine fishes.

URF *abbr.* for unidentified reading frame.

+uria *comb. form* signifying (in relation to a substance specified) presence unusually, or at a supranormal concentration, in urine. Hence also used to denote a morbid condition so marked, e.g. **phenylketonuria**.

uric acid 2,6,8-trioxypurine; purine-2,6,8-triol; the end product of purine metabolism in certain mammals (including humans) and the main nitrogenous excretory product in **uricotelic** animals. It is formed from xanthine by **xanthine oxidase**. Uric acid is very sparingly soluble in water, and deposits as monosodium urate crystals in the tissues in gout.

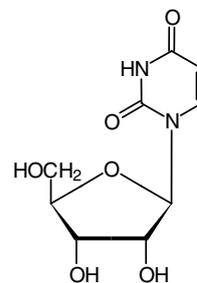

uricase *an alternative name for urate oxidase*.

uricosuric (of a drug) tending to promote urinary excretion of uric acid.

uricotelic describing an organism (or species) in which uric acid is the principal end product of the degradation of nitrogen-containing compounds. Uricotelic animals include birds, terrestrial reptiles, and insects. The low solubility of uric acid in water means that it is present as a solid in the excreta of these animals, enabling excretion with little water loss.

uridine *symbol*: U or Urd; uracil riboside; 1- β -D-ribofuranosyluracil; a ribonucleoside very widely distributed but occurring almost entirely as phosphoric esters in ribonucleotides and ribonucleic acids. *Compare pseudouridine*.

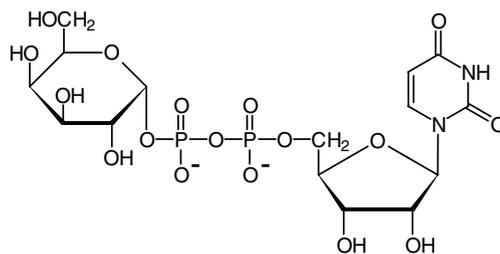

uridine

uridine 2',3'-(cyclic)phosphate *see* **uridine phosphate**.

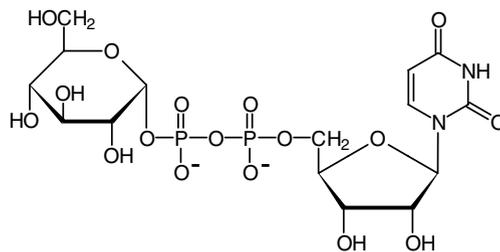

uridine 3',5'-(cyclic)phosphate or **uridine 3',5'-cyclophosphate** *see* **uridine 3',5'-phosphate**.

uridine 5'-diphosphate *symbol*: Urd5'PP or ppU; *the recommended name* for uridine diphosphate (*abbr.*: UDP); 5'-diphosphouridine; 5'-diphosphouridine; 5'-uridylyl phosphate; uridine 5'-(trihydrogen diphosphate); a universally distributed nucleotide that occurs both in the free state and as a component of a number of important **uridinediphosphosugars**. It is the intermediate in the formation of uridine 5'-triphosphate, UTP, from uridine 5'-phosphate, UMP.

uridine diphosphate galactose *symbol*: Urd-5'-PP-Gal or U5'pp1Gal or UDPGal; uridine 5'-(α -D-galactopyranosyl diphosphate); *recommended name*: uridine(5')diphospho(1)- α -D-galactose; an important intermediate in the metabolism of D-galactose and in the formation of numerous derivatives. It is formed by the reaction of galactose 1-phosphate with UDP-glucose (catalysed by **UDPglucose-Hexose-1-phosphate uridylyltransferase**), or with UTP (catalysed by **UTP-hexose-1-phosphate uridylyltransferase**).

uridine diphosphate glucose *symbol*: Urd-5'-PP-Glc or U5'pp1Glc or UDPGlc or UDPG; uridine 5'-(α -D-glucopyranosyl diphosphate); *recommended name*: uridine(5')diphospho(1)- α -D-glucose; an important intermediate in the formation of other sugars from glucose. It is formed by the reaction of glucose 1-phosphate with UTP, catalysed by **UTP-glucose-1-phosphate uridylyltransferase**.

uridinediphosphosugar *abbr.*: UDPsugar; *the recommended name for uridine diphosphate sugar*; any **nucleosidediphosphosugar** in which the distal phosphoric residue of uridine 5'-diphosphate is in glycosidic linkage with a monosaccharide (or a derivative of a monosaccharide). UDPsugars are important as coenzymes for reactions involving the transfer of monosaccharide residues in the biosynthesis of oligosaccharides and polysaccharides (especially in plants) and in the formation of the oligosaccharide moieties of **glycoconjugates**. The main UDPsugars are: UDP-L-arabinose, UDP-D-galactose (*see uridine diphosphate galactose*), UDP-D-galacturonate, UDP-D-glucose (*see uridine diphosphate glucose*), UDP-D-glucuronate, and UDP-D-xylose, all of which are (directly or indirectly) interconvertible where they occur together; UDP-L-iduronate, which is formed by epimerization of UDP-D-glucuronate; UDP-N-acetyl-D-galactosamine and UDP-N-acetyl-D-glucosamine, which are interconvertible; and UDP-N-acetylmuramate, which is synthesized from UDP-N-acetyl-D-glucosamine. Certain UDPsugars, particularly UDP-D-glucose and UDP-D-glucuronate, are coenzymes for the formation in animals or plants of glycosides with aglycons such as bilirubin, phenols, plant pigments and sterols, and steroid hormones.

uridine kinase EC 2.7.1.48; *other name*: uridine monophosphokinase; an enzyme that catalyses the phosphorylation by ATP of uridine to uridine 5'-phosphate with formation of ADP.

uridine monophosphate *abbr.*: UMP; *an alternative name for any uridine phosphate, particularly for uridine 5'-phosphate when its distinction from uridine (5')-diphosphate and uridine (5')-triphosphate requires emphasis.*

uridine 5'-monophosphate synthase *abbr.*: UMP synthase; a multifunctional enzyme that in higher eukaryotes carries out the following two reactions: (1) orotate phosphoribosyltransferase, EC 2.4.2.10; *other names*: orotidylic acid phosphorylase, orotidine-5'-phosphate pyrophosphorylase; *systematic name*: orotidine-5'-phosphate:pyrophosphate phospho- α -D-ribosyltransferase; a reaction of the pathway for *de novo* biosynthesis of pyrimidine nucleotides. It catalyses a reaction between orotate and 5-phospho- α -D-ribose 1-diphosphate to form orotidine 5'-phosphate and pyrophosphate. (2) Orotidine-5'-phosphate decarboxylase, EC 4.1.1.23; *systematic name*: orotidine-5'-phosphate carboxy-lyase; a decarboxylation reaction that forms uridine 5'-monophosphate and CO₂ from orotidine 5'-phosphate.

uridine phosphate *symbol*: UrdP; uridine monophosphate (*abbr.*: UMP); any phosphoric monoester or diester of uridine. There are three monoesters – uridine 2'-phosphate, uridine 3'-phosphate, and **uridine 5'-phosphate** – and two diesters – uridine 2',3'-phosphate and **uridine 3',5'-phosphate** – although uridine 5'-phosphate is the ester commonly denoted (the locant being omitted if no ambiguity may arise). Uridine 2',3'-phosphate (*symbol*: Urd-2',3'-P), *also named* uridine 2',3'-(cyclic)phosphate or cyclic uridine 2',3'-monophosphate (*abbr.*: 2',3'-cyclic UMP), is formed as an intermediate during the alkaline hydrolysis of ribonucleic acid. This diester then readily hydrolyses to a mixture of the two monoesters uridine 2'-phosphate (*symbol*: Urd2'P), *also named* uridine 2'-monophosphate (*abbr.*: 2'UMP) or 2'-uridylic acid or uridylic acid a, and uridine 3'-phosphate (*symbol*: Urd3'P), *also named* uridine 3'-monophosphate (*abbr.*: 3'UMP) or 3'-uridylic acid or uridylic acid b.

uridine 2'-phosphate *see uridine phosphate.*

uridine 2',3'-phosphate *see uridine phosphate.*

uridine 3'-phosphate *see uridine phosphate.*

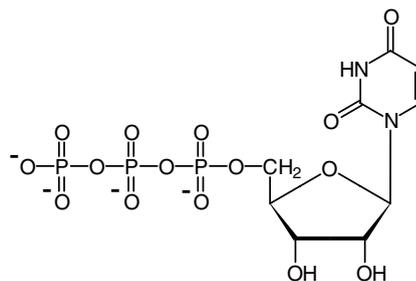

uridine 3',5'-phosphate *symbol*: Urd-3',5'-P; *the recommended name for cyclic uridine 3',5'-monophosphate (abbr.: 3',5'-cyclic UMP or cyclic UMP or cUMP); uridine 3',5'-cyclophosphate; uridine 3',5'-(cyclic)phosphate; a monophosphoric diester of uridine found in most mammalian tissues. It is a cyclic nucleotide similar to adenosine 3',5'-phosphate, cyclic AMP. It has been reported to inhibit the growth of certain transplantable tumours.*

uridine 5'-phosphate or **5'-uridylic acid** or **5'-phosphouridine** or **5'-O-phosphonouridine** *symbol*: Urd5'P; *alternative recommended names for uridine 5'-monophosphate (abbr.: 5'UMP); uridine 5'-(dihydrogen phosphate); uridine (mono)ribonucleotide. (The locant is commonly omitted if there is no ambiguity as to the position of phosphorylation.) It is synthesized from aspartate via the decar-*

boxylation of orotidine 5'-phosphate (i.e. orotidylic acid). Resynthesis of UMP from free uridine formed by degradation of ribonucleic acid can be effected via a **salvage pathway**. UMP is a key intermediate in the formation of uridine 5'-triphosphate, UTP, and hence in the biosynthesis of other pyrimidine nucleotides.

uridine phosphorylase *see pyrimidine-nucleoside phosphorylase.*

uridine 5'-triphosphate *symbol*: Urd5'PPP or pppU; *the recommended name for uridine triphosphate (abbr.: UTP); 5'-triphosphouridine; 5'-uridylyl diphosphate; uridine 5'-(tetrahydrogen triphosphate); a nucleotide present in all cells. It is formed from uridine 5'-phosphate via uridine 5'-diphosphate by the successive action of nucleoside-phosphate kinase (EC 2.7.4.4) and nucleoside-diphosphate kinase (EC 2.7.4.6), which transfer in turn the terminal phosphoric residues from two molecules of ATP. UTP is the starting point for the biosynthesis, first of cytidine triphosphate, next of cytidine diphosphate, and then of various deoxyribonucleotides of cytosine, uracil, and thymine. It is important also for the formation of uridinediphosphogalactose and uridinediphosphoglucose through the action of certain **uridylyltransferases**, and thence of a number of other uridinediphosphosugars.*

uridylyl 1 any chemical group formed by the loss of a 2', a 3', or a 5'-hydroxyl group from the ribose moiety of uridine. **2** a *misnomer for uridylyl*.

uridylylate 1 either the monoanion or the dianion of uridylic acid. **2** any mixture of uridylic acid and its anions. **3** any salt or ester of uridylic acid.

uridylic acid *the trivial name for any phosphoric monoester of uridine. The position of the phosphoric residue on the ribose moiety of a given ester may be specified by a prefixed locant; see uridine phosphate.* However, 5'-uridylic acid is the ester commonly denoted, its locant usually being omitted if no ambiguity may arise. 5'-Uridylic acid is also an alternative recommended name for **uridine 5'-phosphate**.

uridylyl transferase *another name for UDPglucose-hexose-1-phosphate uridylyltransferase. This is a misnomer; compare uridylyl with uridylyl.*

uridylyl the uridine[mono]phospho group; the acyl group derived from uridylic acid. *Distinguish from uridyl.*

uridylylate to introduce uridylyl groups into a compound (e.g. a protein, a ribonucleic acid, or a sugar phosphate), generally through the action of a uridylyltransferase. —**uridylylated** *adj.*; **uridylylation** *n.*

uridylyl-removing enzyme a putative enzyme present in *Escherichia coli* that detaches uridylyl groups from uridylylated nitrogen regulatory protein P_{II} by hydrolysis, with formation of uridylylate. *See also nitrogen regulatory protein, UDPglucose-hexose-1-phosphate uridylyltransferase.*

uridylyltransferase *an alternative name for UDPglucose-hexose-1-phosphate uridylyltransferase.*

urinalysis the chemical and physical analysis of urine.

urinary of, or pertaining to, urine.

urinary stone protein *see osteopontin.*

urine the aqueous excretion produced by the kidneys in higher animals. It serves as a vehicle for the elimination of certain metabolic waste products, e.g. **urea** and **uric acid**, and for the removal of excess ions and water. In mammals and fishes it is fluid, while in birds and reptiles it is semi-solid.

urinometer

urinometer a **hydrometer** specifically designed and calibrated for measuring the specific gravity of (mammalian) urine.

URL *abbr. for uniform resource locator*; a method for identifying WWW sites that is 'uniform', i.e. independent of any specific protocol. URLs have a convention of the type <type>:// of which <type> would typically be http or ftp. Here is a fairly typical URL:

http://www.oup.co.uk/;
in this case

http://www.oup.co.uk/index.html
is the **home page**.

urobilin or **urobilin IX α** a yellow linear tetrapyrrole. It is formed in kidney and is an oxidation product of **urobilinogen**; the central methylene group linking pyrrole units has been converted to -CH=.

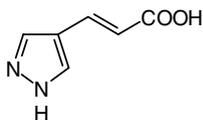

Urobilin gives urine its yellow colour. *See also* **stercobilin**.

urobilinogen or **mesobilirubinogen** or **urobilinogen IX α** a colourless linear tetrapyrrole formed in heme catabolism by reduction of free **bilirubin** released from its glucuronide by intestinal bacterial hydrolases. The four pyrrole rings are linked by three methylene groups. *See also* **stercobilinogen**.

urocanase EC 4.2.1.49; a cytosolic enzyme of liver that converts *trans*-urocanic acid to 4-imidazole-5-propionic acid. Enzyme deficiency results in the rare autosomal recessive anomaly **urocanic aciduria**, which may be associated with mental retardation.

urocanic aciduria *see* **urocanase**.

urocanoate 4-imidazoleacrylate; 3-(1*H*-imidazol-4-yl)propenoate: an intermediate in the degradation of L-histidine by **histidine ammonia-lyase** with the elimination of ammonium.

urocanic acid

urocortin a neuropeptide that has 45% sequence identity with corticotropin-releasing hormone (**CRH**). It binds CRH receptors and is more potent than CRH in suppressing appetite.

urodilatin a 32-amino-acid peptide, isolated from human urine, that is identical in sequence to human **natriuretic peptide** (ANP), but with an N-terminal Thr-Ala-Pro-Arg tetrapeptide extension. It has actions similar to ANP.

uroflavin 1 or **uroflavine** a former name for **riboflavin**. **2** an alternative name for **aquaflavin**.

urogastrone a protein present in human urine that potently inhibits gastric secretion. It is **epidermal growth factor**.

urokinase a proteolytic enzyme found in urine, blood, and kidney cells, that converts **plasminogen** to **plasmin**. *See* **plasminogen activator**.

uromodulin another name for **Tamm-Horsfall glycoprotein**.

uronate 1 the anion of uronic acid. **2** any mixture of a uronic acid and its anion. **3** any salt or ester of a uronic acid.

uronic acid any monocarboxylic acid formally derived by oxidizing to a carboxyl group the terminal hydroxymethylene group either of an **aldose** having four or more carbon atoms in the molecule, or of any glycoside derived from such an aldose. The carbon atom of the (potential) aldehydic carbonyl group is numbered C-1.

uropontin *see* **osteopontin**.

uroporphyrin-III C-methyltransferase EC 2.1.1.107; *systematic name*: S-adenosyl-L-methionine:uroporphyrin-III C-methyltransferase (*abbr.*: SUMT); *other names*: urogen-III methylase; uroporphyrin-III methylase. An enzyme that catalyses a reaction between two molecules of S-adenosyl-L-methionine and uroporphyrin III to form two molecules of S-adenosyl-L-homocysteine and sirohdrochlorin. It forms part of **siroheme synthase**, which is involved in the biosynthesis of siroheme and cobalamin.

uroporphyrinogen decarboxylase EC 4.1.1.37; *systematic name*: uroporphyrinogen-III carboxy-lyase. A cytosolic enzyme that catalyses the decarboxylation of uroporphyrinogen-III to copro-

UTP-glucose-1-phosphate uridylyltransferase

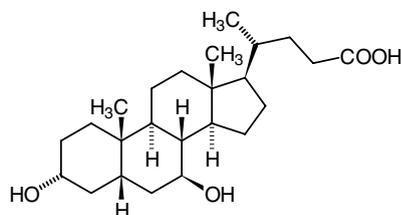

porphyrinogen with loss of four molecules of CO₂; this converts the four carboxymethyl groups of uroporphyrinogen to methyl groups, and is a step in heme synthesis. The crystal structure of the human enzyme (367 amino acids) is available. Mutations in the gene at 1p34 result in enzyme deficiency and the autosomal dominant diseases porphyria cutanea tarda and hepatoerythropoietic porphyria. *See* **porphyria**.

uroporphyrinogen-III synthase EC 4.2.1.75; *systematic name*: hydroxymethylbilane hydro-lyase (cyclizing); *other names*: uroporphyrinogen-III cosynthetase; uroporphyrinogen-III cosynthase. A cytosolic enzyme that catalyses the conversion of hydroxymethylbilane to uroporphyrinogen-III and H₂O. There are two isoforms of the human enzyme (both contain 265 amino acids), derived from the same gene. Many mutations lead to enzyme deficiency and erythropoietic porphyria.

urothione a thienopterin metabolic degradation product of molybdopterin. It is present in human urine, but is undetectable in molybdenum cofactor deficiency.

URR *abbr. for untranslated region*.

ursodeoxycholate or **ursodiol** 3 α ,7 β -dihydroxy-5 β -cholan-24-oate; an epimer of **chenodeoxycholate** found in the bile of bears (hence the name, from Ursidae), as a conjugate with taurine. It prevents the synthesis and absorption of cholesterol and can lead to the dissolution of gallstones.

ursodiol an alternative name for **ursodeoxycholate**.

USA *abbr. for upstream stimulatory activity*; the functional characteristic of a protein that binds an **upstream activator sequence** in a yeast gene and stimulates transcription of the gene by RNA polymerase II.

Usher syndrome an autosomal recessive syndrome of retinitis pigmentosa associated with various hearing disorders, depending on the type of syndrome: **type I** involves vestibular dysfunction and congenital deafness; **type II**, the commonest, involves partial hearing loss; and **type III** is associated with progressive hearing loss. Six genes are associated with subtypes of type I (that for myosin VIIA in type IB, and that for harmonin in type IC); one gene is responsible for type II and encodes an extracellular matrix protein (\approx 1500 amino acids) of retina and other tissues; and one gene is responsible for type III. [After Charles Howard Usher (1865–1942), British ophthalmologist.]

U-snRNA *abbr. for uridylyate-rich small nuclear RNA*; a family of snRNA molecules, often designated U1 to U6 snRNA, that contain 100–215 nucleotides and a 'capped' 5' end. They usually occur as small nuclear ribonucleoprotein particles. Their function may be related to splicing heterogeneous nuclear RNA (hnRNA) to mature mRNA.

USP *abbr. for United States Pharmacopeia*.

USPHS *abbr. for United States Public Health Service*.

UT *abbr. for urea transporter*.

uterine metalloendopeptidase *see* **matrilysin**.

uteroglobin or **blastokinin** a steroid-inducible secreted protein regulator of progesterone concentrations reaching the blastocyst and a potent inhibitor of phospholipase A₂. It is a disulfide-linked homodimer.

uteri (*pl. uteri*) a muscular part of the reproductive tract of female mammals (except Monotremata) that contains the developing embryo and fetus during pregnancy. —**uterine** *adj.*

UTP *abbr. for uridine (5')-triphosphate*.

UTP-glucose-1-phosphate uridylyltransferase EC 2.7.7.9; *sys-*

tematic name: UTP: α -D-glucose-1-phosphate uridylyltransferase; *other names:* UDPglucose pyrophosphorylase; glucose-1-phosphate uridylyltransferase. An enzyme that forms uridinediphosphoglucose; it catalyses a reaction between UTP and α -D-glucose 1-phosphate to form UDPglucose and pyrophosphate.

UTP-hexose-1-phosphate uridylyltransferase EC 2.7.7.10; *systematic name:* UTP: α -D-hexose-1-phosphate uridylyltransferase; an enzyme that can form uridinediphosphogalactose. It catalyses a reaction between UTP and α -D-galactose 1-phosphate to form UDPgalactose and pyrophosphate. The sugar substrate α -D-glucose 1-phosphate can also act (but more slowly) as an acceptor, forming uridinediphosphoglucose. Deficiency of the enzyme in infancy causes a mild form of **galactosemia**.

UTP-xylose-1-phosphate uridylyltransferase EC 2.7.7.11; *other name:* xylose-1-phosphate uridylyltransferase; an enzyme that catalyses a reaction between UTP and α -D-xylose 1-phosphate to form UDPxylose and pyrophosphate.

UTR *abbr. for* untranslated region.

utrophin or **dystrophin-related protein** (*abbr.:* DRP) a protein that is highly similar to **dystrophin**, and found in normal adult human muscle, primarily at the neuromuscular junction. In the absence of dystrophin, in Duchenne muscular dystrophy, it is also present in the sarcolemma. It is an actin-binding protein related to α -**actinin**. Both gene and protein sequences resemble those for dystrophin. Over-expression of utrophin in a dystrophin-deficient (*mdx*) mouse demonstrates that it can functionally replace dystrophin; it has been suggested that this could offer a therapeutic strategy for Duchenne muscular dystrophy.

UUA a codon in mRNA for L-leucine.

UUC a codon in mRNA for L-phenylalanine.

UUG a codon in mRNA for L-leucine.

UUU a codon in mRNA for L-phenylalanine.

UV or *uv abbr. for* ultraviolet (radiation).

UV crosslinking a method whereby short exposure (1 min) to ultraviolet (UV) light (254 nm) causes RNA or DNA immobilized on nitrocellulose or nylon membranes to become covalently attached to the membrane.

uvomorulin or **epithelial cadherin** or **E-cadherin** a type I membrane protein and **cadherin** of non-neural epithelial tissues.

uvr any of four genes in *Escherichia coli* that are induced by the **SOS repair** system and whose products are involved in the repair of damage to DNA caused by UV light and DNA-reactive chemicals. Three of these genes, *uvrA*, *uvrB*, and *uvrC*, encode the three subunits of the ABC excision nuclease; this recognizes the structural distortion created by a **thymine dimer** and cleaves the damaged strand at two sites, about 12 nt apart, leaving a gap that is subsequently filled by polymerase and ligase action. Because the enzyme cuts at two sites it is not a classical endonuclease, but is referred to as an **excinuclease**. The fourth gene, *uvrD*, encodes a DNA helicase with ATPase activity, similar to the *rep* (*see RepA*) gene product; it promotes the ATP-dependent unwinding of the DNA duplex during repair.

UWGCG *abbr. for* University of Wisconsin Genetics Computer Group. *See* **GCG**.

Vv

v *symbol for 1* specific volume. **2** volume (alternative to *V*). **3** velocity of reaction (i.e. **rate of reaction**); a subscript (in small capital letters) may be added (e.g. v_A) to denote rate of consumption, or rate of formation, of a specified reactant (e.g. *A*). **4** initial velocity of an enzymic reaction; *see also* v_0 . **5** (bold italic) velocity (alternative to *u*, *w*, or *c*).

v_0 *symbol for* initial velocity (i.e. initial rate) of an enzymic reaction. The subscript may be omitted when rates at other times are not in question.

v_i *symbol for* chemical flux through the (enzymic) step with rate constant k_i . Similarly, flux through steps with rate constants k_{-i} or k_{ij} are denoted by v_{-i} and v_{ij} respectively.

v_{max} *symbol for* the true maximum value of the **rate of reaction**. Compare V_{max} .

V *symbol for 1* volt. **2** a residue of the α -amino acid L-valine (alternative to Val). **3** vanadium. **4** *the recommended symbol for limiting rate*.

V *symbol for 1* electric potential. **2** potential energy. **3** volume (alternative to *v*). **4** *the recommended symbol for limiting rate*.

V_m *symbol for* molar volume.

V_M *symbol for* hold-up volume.

V_{max} *symbol for* maximum velocity (i.e. **limiting rate**) of an enzyme reaction (alternative to *V*).

Vac *symbol for* vaccenic acid.

Vac A a toxin secreted by *Helicobacter pylori* that is the major virulence factor in human gastric ulcer formation.

vaccenate 1 *numerical symbol*: 18:1(11); *the trivial name for* either of the isomers (*cis*-vaccenate and *trans*-vaccenate) of octadec-11-enoate, $\text{CH}_3\text{---}[\text{CH}_2]_5\text{---CH=CH---}[\text{CH}_2]_9\text{---COO}^-$, the anions derived from *cis*-vaccenic acid, (*Z*)-octadec-11-enoic acid, and *trans*-vaccenic acid, (*E*)-octadec-11-enoic acid, a stereoisomeric pair of monounsaturated straight-chain higher fatty acids. *See also* **octadecenoic acid**. **2** any mixture of either *cis*- or *trans*-vaccenic acid and its corresponding anion. **3** any salt or ester of either isomer of vaccenic acid.

vaccenoyl *symbol*: Vac; *the trivial name for* either of the isomers (*cis*-vaccenoyl and *trans*-vaccenoyl) of octadec-11-enoyl, $\text{CH}_3\text{---}[\text{CH}_2]_5\text{---CH=CH---}[\text{CH}_2]_9\text{---CO-}$, the acyl groups derived from *cis*-vaccenic acid, (*Z*)-octadec-11-enoic acid, and *trans*-vaccenic acid, (*E*)-octadec-11-enoic acid. The *cis*-vaccenoyl group is a major fatty-acyl component of many bacterial lipids and a constituent of the oils of marine organisms. The *trans*-vaccenoyl group is present in a minor proportion of the acylglycerols in the body and milk fats of ruminants.

vaccination the process of administering a **vaccine** to produce immunity.

vaccine any preparation of immunogenic material suitable for the stimulation of active immunity in animals without inducing disease. Vaccines may be based on dead or attenuated microorganisms; altered toxins (toxoids); or viruses.

vaccinia virus a DNA virus and the type species of the genus *Orthopoxvirus* (or 'vaccinia subgroup'), which also includes the viruses responsible for cowpox, buffalopox, catpox, mousepox, and (formerly) smallpox (variola virus). Vaccinia infection usually causes only mild symptoms. Because of its serological similarity to the smallpox virus, vaccinia virus was formerly used as the basis of a live vaccine to protect humans against smallpox. Engineered vaccinas with surface antigens of hepatitis B, influenza virus, and vesicular stomatitis virus (which kills cattle, horses, and pigs) have produced useful vaccines in animal tests. However, adverse reactions with vaccinia-virus vaccines are well documented.

vacuolar apparatus the cellular digestive system, consisting of **lysosomes** and closely related, hydrolase-free, vacuolar structures. It is concerned with the digestion of both endogenous and exogenous materials.

vacuolar ATPase an enzyme of the synaptic vesicle membrane that pumps protons into the vesicle as it loses acetylcholine during nerve

transmission; subsequently, the hydrons are released as the vesicle is recharged with acetylcholine. The enzyme (at least 10 subunits) resembles **H⁺-transporting ATP synthase**, but functions as a proton pump.

vacuolar sorting protein or **vacuolar protein sorting-associated protein** (*abbr.*: vps); any of numerous proteins that are involved in the vesicle-mediated transfer of enzymes to the yeast vacuole. Many share similarity with proteins from higher eukaryotes.

vacuole a closed structure, found only in eukaryotic cells, that is completely surrounded by unit membrane and contains liquid material. Plant cells contain a conspicuous vacuole, which may occupy up to 95% of the cell volume. In these cells it has a role similar to that of lysosomes of animal cells, being rich in hydrolytic enzymes (especially various types of protease). In seed reserve tissues, specialized protein storage vacuoles contain abundant storage protein deposited during seed maturation. Upon germination, a specific protease is imported to supply amino acids to the new seedling. Compare **vesicle**.

vacuum (*pl.* **vacuums** or **vacua**) a space containing a gas at low pressure; i.e. a space in which there are relatively few atoms or molecules. A **perfect vacuum** would contain no atoms or molecules, but this is unobtainable owing to the vapour pressure of materials containing any vacuum. Vacuums may be classified into **low** (or **soft**) **vacuum**, $\approx 10^{-2}$ Pa; **high** (or **hard**) **vacuum**, $10^2\text{--}10^7$ Pa; and **ultra-high vacuum**, $<10^{-7}$ Pa.

vacuum evaporation a technique for depositing a thin film of some solid material on a surface by evaporating the material at a high temperature in a vacuum. Atoms leaving the hot material travel directly to the cool surface to form a coating without colliding with other molecules in the gas phase; they condense on the cool surface and build up a layer of solid. *See also* **shadow casting**.

vacuum ultraviolet *see* **ultraviolet radiation**.

vagusstoff *the German name for* 'active factor'; a factor first demonstrated in 1903 (by German-born US physiologist Otto Loewi (1873–1961)) to be secreted into plasma after stimulation of the vago-sympathetic trunk and to inhibit cardiac function. It was later identified as **acetylcholine** by British physiologist (Sir) Henry Hallett Dale (1875–1968).

Val *symbol for 1* the α -amino acid L-valine (alternative to V). **2** the (*cis*- or *trans*-) vaccenoyl group.

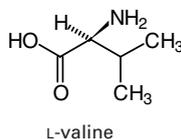

valency or (*esp. US*) **valence 1** the numerical combining power of an atom (and thus of a chemical element), ion, or chemical group, equal to the number of hydrogen atoms that the atom, ion, or group could combine with or replace. *See also* **covalence**, **electrovalence**. **2** the number of antigenic determinants with which one antibody molecule, or fragment thereof, will combine.

valerate 1 *the trivial and preferred name for* pentanoate; the anion, $\text{CH}_3\text{---}[\text{CH}_2]_3\text{---COO}^-$, derived from valeric acid (i.e. pentanoic acid). **2** any mixture of free valeric acid and its anion. **3** any salt or ester of valeric acid.

valeryl *symbol*: Vl; *the trivial name for* pentanoyl; the acyl group, $\text{CH}_3\text{---}[\text{CH}_2]_3\text{---CO-}$, derived from valeric acid (i.e. pentanoic acid).

valinate 1 valine anion; the anion, $(\text{CH}_3)_2\text{CH---CH}(\text{NH}_2)\text{---COO}^-$, derived from **valine**. **2** any salt containing valine anion. **3** any ester of valine.

valine *the trivial name for* α -aminoisovaleric acid; α -amino- β -methylbutyric acid; 2-amino-3-methylbutanoic acid; $(\text{CH}_3)_2\text{CH---CH}(\text{NH}_2)\text{---COOH}$; a chiral α -amino acid. L-valine (*symbol*: V or Val), (*S*)-2-amino-3-methylbutanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: GUA, GUC, GUG, or GUU. In mammals, it is an essential dietary amino acid, and is glucogenic. Residues of D-valine (*symbol*: D-Val or DVal), (*R*)-2-amino-3-methylbutanoic acid, occur in a number of peptide antibiotics: e.g., in several members of the actinomycin family; gramicidins A, B, C, and D; and valinomycin (the latter also contains residues of L-valine).

valine-isoleucine aminotransferase *see* **valine-3-methyl-2-oxo-valerate aminotransferase**.

valine-3-methyl-2-oxo-valerate aminotransferase EC 2.6.1.32; *recommended name*: valine-3-methyl-2-oxo-valerate transaminase; *other names*: valine-isoleucine transaminase; valine-isoleucine aminotransferase; an enzyme that catalyses the reaction:

See also **transamination**.

valinium valine cation; the cation $(\text{CH}_3)_2\text{CH}-\text{CH}(\text{NH}_3^+)-\text{COOH}$, derived from **valine**.

valino the alkylamino group, $(\text{CH}_3)_2\text{CH}-\text{CH}(\text{COOH})-\text{NH}-$, derived from **valine**.

valinomycin a cyclic 12-residue depsipeptide antibiotic that consists of three moieties, each having one molecule each of L-valine, D- α -hydroxyvaleric acid, D-valine, and L-lactic acid. The D-valine carboxyl group is directly linked to the α -carbon of L-lactic acid. Valinomycin is produced by *Streptomyces fulvissimus* and is active especially against *Mycobacterium tuberculosis*. It forms an ionophore by folding to produce a hydrophobic surface with an interior that binds Rb^+ , Cs^+ , NH_4^+ , or, especially, K^+ . It interferes with oxidative phosphorylation by rendering the mitochondrial membrane permeable to K^+ ions.

valium *see* **diazepam**.

valproic acid 2-propylpentanoic acid; $(\text{CH}_3-\text{CH}_2-\text{CH}_2)_2\text{CH}-\text{COOH}$; an antiepileptic, also used as sodium valproate (*one proprietary name*: Epilim).

valyl the acyl group, $(\text{CH}_3)_2\text{CH}-\text{CH}(\text{NH}_2)-\text{CO}-$, derived from **valine**.

VAMP *abbr. for* vesicle-associated membrane protein (i.e. **synaptobrevin**).

vanadyl ribonucleoside complex an inhibitor of ribonucleases sometimes used in the isolation of RNA from cells and tissues.

vancomycin a complex glycopeptide, $\text{C}_{66}\text{H}_{75}\text{Cl}_2\text{N}_9\text{O}_{24}$, from *Streptomyces orientalis*. It inhibits a specific step in the synthesis of the peptidoglycan layer in the Gram-positive bacterium *Staphylococcus aureus*. It is synthesized by a multimodular nonribosomal peptide synthetase. *See also* **vancosamine**.

vancosamine the aminodeoxysugar 3-amino-2,3,6-trideoxy-3-C-methyl-L-lyxo-hexose; the carbohydrate component of **vancomycin**.

van den Bergh reaction a reaction for the determination of **bilirubin** that depends on the formation of a red azo dye by bilirubin and diazotized sulfanilic acid. A **direct reaction** in aqueous solution is given by bilirubin glucuronide, and an **indirect reaction** is given in alcoholic solution by free bilirubin. [After A. A. Hijmans van den Bergh (1869–1943), Dutch physician.]

van der Waals force a long-range force between molecules or submolecular groups, effective from >50 nm to interatomic spacings. Such forces are always present, but weak, and often compete with electrostatic forces. In general they do not follow a simple power law; e.g. the force may be attractive at large separations but repulsive at small ones, or vice versa. The van der Waals free energy between two molecules or submolecular groups usually depends on their mutual orientation, i.e. these forces tend to align two molecules so as to minimize their free energy of interaction. [After Johannes Diderik van der Waals (1837–1923), Dutch physicist.]

van der Waals radius one half of the internuclear distance between atoms at equilibrium when the long-range attractive forces balance the short-range repulsive forces. It is larger than the atom's covalent radius and is about equal to the ionic radius of monovalent ions.

Van Dyke protein *an old name for* **neurophysin**.

vanilloid receptor *see* **capsaicin**.

vanillylmandelate *see* **hydroxy-methoxymandelate**.

Van Slyke apparatus 1 a volumetric apparatus formerly widely used for the determination of oxygen and carbon dioxide contents of blood samples. **2** an apparatus for the gasometric determination of aliphatic amino-nitrogen, e.g. in proteins, by measurement of the nitrogen gas evolved on reaction with nitrous acid. [After Donald Dexter Van Slyke (1883–1971), US biochemist.]

van't Hoff equation or **van't Hoff isochore** a relation describing the temperature variation of an equilibrium constant, K , of a reaction in terms of the change in heat content, ΔH° , i.e. in terms of the heat of reaction at constant pressure. It is: $\text{dln}K/\text{d}T = \Delta H/RT^2$, where R is the gas constant and T the thermodynamic temperature. [After Jacobus Henricus van't Hoff (1852–1911), Dutch physical chemist.]

van't Hoff law the principle that the osmotic pressure exerted by a solute is equal to the pressure the solute would exert if it were an ideal gas at the same temperature as the solution and of the same volume. Hence $\Pi V = RT$, where Π is the osmotic pressure, V is the volume of solution containing 1 mole of solute, R the gas constant, and T the thermodynamic temperature.

van't Hoff limiting law a relation giving the limiting value for the osmotic pressure exerted by an ideal solute:

$$\text{limit } (c \rightarrow 0) \Pi = RT/M_r,$$

where Π is the osmotic pressure, c the solute concentration, M_r the relative molecular mass of the solute, R the gas constant, and T the thermodynamic temperature.

varanic acid or **3 α ,7 α ,12 α ,24 β -tetrahydroxycholestanic acid** an intermediate (as the CoA ester) in the beta oxidation of the side chain of trihydroxycholestanoyl-CoA to choloyl-CoA in the synthesis of cholic acid. It accumulates in some peroxisomal defects, e.g. in D-bifunctional enzyme deficiency. *See* **peroxisomal bifunctional enzyme**.

variable 1 liable to change; having a range of possible values; liable to deviate from an established type. **2** something that is subject to variation; a quantity or function that can assume any of a set of specified values; a symbol for any unspecified number or quantity.

variable arm *an alternative name for* **extra arm** of tRNA.

variable number tandem repeats *abbr.*: VNTR; a multiallelic DNA polymorphism that results from insertions or deletions of DNA between two **restriction sites**. The existence of these repeats is exploited in **genetic profiling**.

variable region *symbol*: V; a region within a chain of an **immunoglobulin** molecule having an amino-acid sequence that characteristically varies between molecules of the same immunoglobulin class. There are typically four variable regions: the N-terminal halves of the two **light chains** (V_L) and the N-terminal halves of the **Fd fragments** (V_H) of the two heavy chains. The amino-acid sequences of these variable regions determine the structure of the antibody-combining site. *Compare* **constant region**.

variance a measure of the dispersion of a population, the mean square average of the deviations from the **mean**. It is the square of the **standard deviation**, σ , of that population.

variant 1 something that deviates from the norm; used especially of abnormal proteins (e.g., hemoglobins). **2** different; showing variation; used especially of different amino-acid residues in the corresponding positions of polypeptide chains from different sources.

variant Creutzfeldt-Jakob disease *abbr.*: vCJD; *see* **Creutzfeldt-Jakob disease**.

Vasa a protein of *Drosophila* that is required to activate the mRNA for oskar in oocytes.

vascular of, or relating to vessels that conduct fluid from one part of an organism to another, e.g. the blood vessels in animals, or the xylem and phloem in plants.

vascular cell adhesion molecule *see* **VCAM**.

vascular endothelial growth factor *abbr.*: VEGF; *also known as* **vascular permeability growth factor** or **vasculotropin**; a protein secreted by epithelial cells, macrophages, and smooth muscle cells, that is active in angiogenesis and endothelial cell growth; it induces endothelial proliferation and vascular permeability. Related to **platelet-derived growth factor**, it is a disulfide-linked homodimer.

vascular endothelial growth factor receptor *abbr.*: VEGF receptor; a type I membrane protein that contains seven immunoglobulin-fold domains in the extracellular segment. It is related to the platelet-derived growth factor receptor, with an intracellular bipartite tyrosine kinase domain.

vascular permeability growth factor *see* **vascular endothelial growth factor**.

vasculature the **vascular** system in animals.

vasculotropin *see* **vascular endothelial growth factor**.

vaso+ *comb. form* denoting a blood vessel.

vasoactive describing any agent that affects the diameter of blood vessels. *See also* **vasoconstrictor**, **vasodilator**.

vasoactive intestinal contractor *see* **endothelin**.

vasoactive intestinal polypeptide *abbr.*: VIP; a basic 28-residue peptide amide, similar to **gastric inhibitory polypeptide**, **glucagon**, and **secretin**, that is widely distributed in the body, mainly in nervous tissue (especially of the gut) and appears to be a neurotransmitter in **peptidergic** autonomic nerves. It has potent hypotensive and vasodilatory effects. It has the sequence

vasoactive intestinal polypeptide receptor or **vasoactive intestinal peptide receptor** any G-protein-associated membrane protein that binds **vasoactive intestinal polypeptide** (VIP) and mediates its intracellular effects. That of humans contains 362 residues. It activates adenylate cyclase; other endogenous ligands include peptide HI (PHI), GHRH, and secretin, the order of potency being VIP > PHI > GHRH > secretin.

vasoconstrictor a vasoactive agonist that causes **vasoconstriction**, i.e. a decrease in the diameter of blood vessels.

vasodilator a vasoactive agonist that causes **vasodilation**, i.e. an increase in the diameter of blood vessels.

vasopressin or **antidiuretic hormone** (*abbr.*: ADH); either of two nonapeptide hormones secreted by the neurohypophysis and similar to **vasotocin** and **oxytocin**. [**8-Arginine**]vasopressin (*abbr.*: [Arg⁸]vasopressin or AVP) has the sequence

with a disulfide bridge joining residues at positions 1 and 6. It raises blood pressure by constricting the peripheral arterioles and capillaries. It is also an antidiuretic, accelerating water reabsorption from the proximal region of the distal convoluted tubules of the kidney. AVP is released from a large precursor molecule, **vasopressin-neurophysin 2-copeptin precursor**, which includes its associated carrier protein (**neurophysin**). It is packaged into granules where the hormone is cleaved off and secreted into the blood in free form as required. Deficiency of AVP is the cause of autosomal dominant neurohypophysial diabetes insipidus (ADNDI). The analogue, [8-lysine]vasopressin (*abbr.*: [Lys⁸]vasopressin), in which lysine is substituted for arginine at position 8, is formed, either singly or together with arginine vasopressin, in the pig family.

vasopressin-neurophysin 2-copeptin precursor the precursor of **vasopressin**, **neurophysin 2** (*see* **neurophysin**), and **copeptin**. Copeptin is a glycopeptide (38 amino acids) that is released during processing of the precursor.

vasopressin receptor any G-protein-associated membrane receptor that binds [8-arginine]vasopressin (AVP; *see* **vasopressin**) and mediates its intracellular effects; peptides related to AVP, including **oxytocin**, are also bound. There are two types: V₁ – subdivided into V_{1a} (vascular/hepatic) and V_{1b} (anterior pituitary) – and V₂ (kidney); these can be distinguished pharmacologically on the basis of selective agonists. V₂ receptors are restricted to the kidney and are encoded at the locus for **nephrogenic diabetes insipidus**. V₁ receptors are coupled to phosphoinositide-specific phospholipase C, and V₂ receptors to adenylate cyclase. AVP is a more potent agonist for both V₁ and V₂ receptors than oxytocin. *See also* **oxytocin receptor**.

vasostatin either of two segments of **chromogranin A**. Vasostatin I comprises residues 1–76, lowers vascular tension, reduces secretion of parathyroid hormone, and is bacteriostatic and antifungal. Vasostatin II comprises residues 1–115 and has the first two properties of vasostatin I.

vasotocin a vasoactive peptide, closely related structurally to argi-

nine **vasopressin** and **oxytocin**, that is secreted by the posterior pituitary gland in birds, reptiles, and some amphibians. It has the sequence

with a disulfide bond between the two cysteines.

VASP *abbr. for* vasodilator-stimulated phosphoprotein; a substrate for cyclic AMP- and cyclic GMP-dependent protein kinases in platelets. It is associated with actin filaments and focal adhesions, and contains an EVH1 homology sequence that binds a proline-rich motif.

VAST *abbr. for* vector alignment search tool; *see* **database-search program**.

vault a large ribonucleoprotein complex of unknown function localized primarily in the cytoplasm of eukaryotic cells. Vaults contain **V-PARP**, MVP (major vault protein, which is also a substrate for V-PARP), and **TEP-1** (a protein of the telomerase complex). They increase in amount in multidrug-resistant cancers.

VCAM *abbr. for* vascular cell adhesion molecule; a class of **adhesion molecules** belonging to the immunoglobulin superfamily. The class is exemplified by VCAM-1 (CD106; molecular mass 90–110 kDa). This is expressed on endothelial cells, macrophages, dendritic cells, fibroblasts, and myoblasts, and is inducible within 6–10 h by interleukin 1 β , interleukin 4, tumour necrosis factor α , or interferon γ . It binds to VLA-4 (*see* **VLA**) and integrin $\alpha_4\beta_7$ (*see* **integrin**), and mediates adhesion of lymphocytes, monocytes, and eosinophils to activated endothelium.

vCJD *abbr. for* variant **Creutzfeldt–Jakob disease**.

VCP *abbr. for* valosin-containing protein; the human homologue of yeast Cdc48. *See* **cdc gene**.

V(D)J recombinase *see* **RAG**.

VecScreen *see* **vector-screening program**.

vector 1 or **vector quantity** a quantity specified by its direction and sense as well as by its magnitude. **2** (*in pathology*) an organism that carries an organism of a different species from one place to another, especially one that transfers a **pathogen** between hosts, either mechanically (**mechanical vector**) or by playing a specific role in the pathogen's life cycle (**biological vector**). *Compare* **vehicle** (def. 2). **3** (*in genetics*) *see* **cloning vector**.

vector database a repository of known vector sequences used by vector-screening programs to identify sequence contaminants; an example is UniVec.

vectorette PCR a method based on the **polymerase chain reaction** (PCR) used for amplifying an unknown DNA sequence adjacent to a known DNA sequence. It was previously used in **chromosome walking** but still finds application in recovering sequences adjacent to mutations caused by insertional mutagenesis. The double-stranded vectorette is ligated to the ends of restriction fragments thereby introducing a known sequence that can be used to prime one side of a PCR reaction, the other being primed on the known genomic sequence.

vectorial enzyme any enzyme, such as one fixed in a membrane, that is directional in its action, e.g. **sodium/potassium ATPase**.

vectorial processing processing of a fully formed precursor polypeptide into a mature protein when used to drive the movement of the protein from one aqueous compartment (e.g. the cytoplasm) through a membrane into a second aqueous compartment (e.g. an intramitochondrial or intrachloroplastal space). *Compare* **vectorial translation**.

vectorial translation the stage of **translation** in the biosynthesis of any protein destined for export from a cell, where a nascent polypeptide being produced on a **polysome** bound to the membrane of the rough endoplasmic reticulum in a eukaryote is conducted through the membrane by its N-terminal **signal peptide**. *Compare* **vectorial processing**.

vector-screening program a program that uses a database of known vector sequences to screen sequences for vector contaminants; an example is VecScreen.

vegetal hemisphere glycoprotein 1 *abbr.*: Vg-1; a glycoprotein of the TGF- β family (*see* **transforming growth factor**) that facilitates the differentiation of either mesoderm or endoderm.

vegetal pole

vegetal pole the end at which most of the yolk is located e.g. in an amphibian egg; the end opposite the **animal pole**.

vegetative describing cells or tissues that are engaged in nutrition and growth rather than sexual reproduction, and excluding dormant forms.

vegetative bacteriophage the intrabacterial genome of a **bacteriophage** when it is noninfective but controlling the synthesis by the host of components needed to make new infective bacteriophage particles.

vegetative reproduction 1 (*in plants*) a form of **asexual reproduction** in which new individuals develop from specialized multicellular organs (e.g. bulbs, corms, tubers) that break off from the parent plant. **2** (*sometimes*) a term used to describe **budding** (def. 2) and similar forms of asexual reproduction in animals such as coelenterates and sponges.

VEGF *abbr. for* vascular endothelial growth factor.

vehicle 1 any inert medium with which a biologically active substance (e.g. a drug) is mixed or in which it is dissolved, suspended, or emulsified in order to increase its bulk and/or to facilitate its absorption after administration. **2** any agent (animate or inanimate) of transmission, especially of infection; *see also* **vector** (def. 2).

vein 1 (*in animals*) the blood vessels conducting blood from the tissues. **2** (*in plants*) a vascular bundle in a leaf.

velocity of reaction *an alternative name for* **rate of reaction**.

venom any toxic animal secretion that is produced by discrete glands and is delivered by a specific mechanism for defensive or offensive purposes.

venombin either of two serine proteinases found in snake venom. **Venombin AB** EC 3.4.21.55; *other name:* gabonase (from the venom of the gaboon viper, *Bitis gabonica*); it cleaves Arg-|-Xaa bonds in fibrinogen to form fibrin and release fibrinopeptides A and B; it is not inhibited by antithrombin III or hirudin. **Venombin A** EC 3.4.21.74; it cleaves Arg-|-Xaa bonds in fibrinogen to form fibrin and release fibrinopeptide A, but further reaction depends on species; it is a trypsin-like enzyme.

venous of, or relating to, a **vein**, or to the blood in the veins.

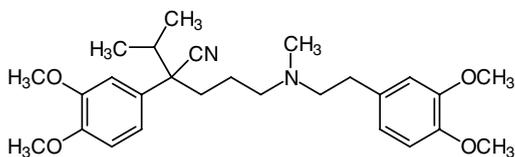

ventilation the passage of air into and out of the respiratory tract, or other confined space.

Ventolin *see* **sambutamol**.

Vent polymerase or **Deep Vent polymerase** *the proprietary name for* thermostable DNA polymerases used as alternatives to **Taq DNA polymerase** in the **polymerase chain reaction**. They have a higher fidelity than the **Taq** DNA polymerase, derived in part from their exonuclease activity. They derive from the archaean *Thermococcus litoralis*, isolated from a submarine thermal vent, hence the enzyme's name.

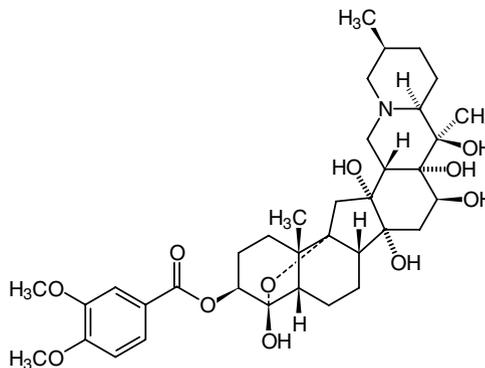

ventral situated towards the belly surface of an animal.

verapamil α -3-[2-(3,4-dimethoxyphenyl)ethyl]methylamino propyl-3,4-dimethoxy- α -(1-methylethyl)benzeneacetonitrile; iproveratril; D365; a Ca²⁺-blocking agent used in the treatment of cardiac disorders and to inhibit the movement of calcium ions across biological membranes. It acts like **nifedipine**, which binds to the dihydropyridine binding site of vascular voltage-operated **calcium channels**; verapamil probably acts at another related site. *See also* **D600**.

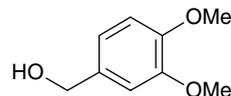

veratridine a toxic alkaloid, C₃₆H₅₁NO₁₁, found in the seeds of *Schoenocaulon officinalis* (of the lily family) and in the rhizome of *Veratrum album*. It blocks the development of the action potential involved in axonal conduction, binding to the Na⁺ channels and blocking them in the open configuration.

very-low-density lipoprotein

veratridine

veratryl alcohol 3,4-dimethoxyphenol, a compound derived from the breakdown of lignin. Is a substrate for lignin peroxidase, becoming oxidized to a cation radical that attacks the lignin structure.

-verbA related protein *see* **COUP**.

verbascose the tetrasaccharide, *O*- α -D-galactopyranosyl-(1 \rightarrow 6)-*O*- α -D-galactopyranosyl-(1 \rightarrow 6)-*O*- α -D-glucopyranosyl-(1 \rightarrow 2)- β -D-fructofuranoside. It occurs in roots of the mullein, *Verbascum thapsus*.

verdoperoxidase *see* **myeloperoxidase**.

verification 1 establishment of the correctness of a theory, fact, etc. **2** a term used to describe the deacylation of misacylated tRNA molecules by the specific aminoacyl-tRNA synthase.

Verner-Morrison syndrome or **pancreatic cholera** a syndrome of humans characterized by severe watery diarrhoea, achlorhydria or hypochlorhydria, weight loss, and dehydration. It is caused by tumours (**VIPomas**), mostly of pancreatic origin (some are neurogenic), that produce **vasoactive intestinal polypeptide** (VIP), the circulating levels of which are raised. [After John Victor Verner (1927-), US physician and Ashton Byrom Morrison (1922-), US pathologist.]

Veronal *a proprietary name for* **barbital**.

verotoxin a pentameric pore-forming toxin (5 \times 89 amino acid residues) belonging to the shiga toxin B family (TC 1.C.54).

Versene *a proprietary name for* the tetrasodium salt of **edetate**.

versican or **large fibroblast proteoglycan** or **chondroitin sulfate proteoglycan core protein 2** a protein involved in intercellular signalling. The N-terminal part is similar to a glial hyaluronate-binding protein; the middle contains glucosaminoglycan attachment sites; the C-terminal part contains EGF-like repeats (*see* **epidermal growth factor**) and a lectin-like domain.

vertical rotor a rotor for use in an **ultracentrifuge**. The wells holding the tubes are drilled parallel to the axis of rotation and at right angles to the lines of the centrifugal force.

very-long-chain acyl-CoA dehydrogenase an acyl-CoA dehydrogenase that is specific for acyl moieties 14-22 carbons long. The human enzyme contains 615 residues and FAD, and occurs as a homodimer associated with the matrix side of the inner mitochondrial membrane. Many mutations result in deficiency and a clinical presentation that resembles **Reye syndrome**.

very-low-density lipoprotein *abbr.:* VLDL; a class of lipoproteins found in blood plasma in many animals (data normally relate to humans). VLDL is also known as pre-beta lipoprotein because its electrophoretic mobility is slightly greater than that of low-density, or beta-lipoprotein. VLDL particles have diameter 25-70 nm,

solvent density for isolation (g mL^{-1}) <1.006 , hydrated density (g mL^{-1}) 0.97 . Their approximate composition (% by weight) is 5–8% unesterified cholesterol, 11–14% esterified cholesterol, 20–23% phospholipid, 44–60% triacylglycerol, 4–11% protein. Their apolipoprotein composition (% by weight total apolipoprotein) is 36.9% B-100, 49.9% C-I + C-II + C-III, 13% E-II + E-III + E-IV. They are synthesized in liver and are the precursor of low-density lipoprotein.

very-low-density-lipoprotein receptor *abbr.*: VLDL receptor; a membrane protein that binds VLDL, accumulates in clathrin-coated pits, and internalizes VLDL. It has a large extracellular domain, a single transmembrane domain, and a small intracellular domain. In human the precursor protein consists of 873 amino acids; residues 1–27 are the signal, 28–797 constitute the extracellular domain, and 820–873 are the cytoplasmic domain.

vesicle a closed structure, found only in eukaryotic cells, that is completely surrounded by a unit membrane but, unlike a **vacuole**, contains material that is not (or is not known to be) in the liquid state.

Vg-1 *abbr.* for vegetal hemisphere glycoprotein 1.

VHDL *abbr.* for very-high-density lipoprotein.

VHL *abbr.* for von Hippel–Lindau protein; a 213-residue protein encoded at 3p25 by the gene for the **von Hippel–Lindau syndrome** of hereditary renal and other cancers. VHL binds **cullin-2** and then **elongins B** and **C**, and the complex translocates to the nucleus. By sequestering elongins B and C it prevents formation of the heterotrimeric transcription factor elongin (which consists of elongins A, B, and C). But its proper function may be to target other nuclear proteins to ubiquitin-mediated degradation. Numerous mutations in the VHL gene are associated with sporadic and hereditary renal carcinoma, indicating that VHL is a tumour suppressor. [After Eugen von Hippel (1867–1939), German ophthalmologist, and Arvid Lindau (1892–1958), Swedish pathologist.]

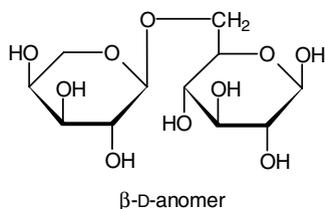

viability a measure of the capacity of a cell for metabolism and division. It is often estimated experimentally by determining the number of cells that exclude normally membrane-impermeant dyes, e.g. **Trypan Blue**.

Viagra a proprietary name for sildenafil; 5-[2-ethoxy-5-(4-methylpiperazin-1-yl)phenyl]-1-methyl-3-propyl-1,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one; used for the oral treatment of male erectile dysfunction. It selectively inhibits a specific phosphodiesterase that hydrolyses cyclic GMP; the latter mediates the action of nitric oxide in normal erectile function, an action which is thus potentiated.

VIC *abbr.* for vasoactive intestinal contractor; see **endothelin**.

vic- prefix (in chemical nomenclature) denoting the presence of **vicinal** (def. 2) substituents.

vicianose the disaccharide 6-O- α -L-arabinosyl-D-glucose, obtained from a glycoside in seeds of *Vicia angustifolia*.

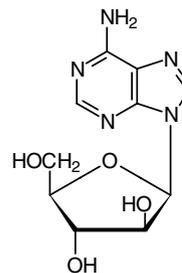

vicillinpeptidohydrolase see **legumain**.

vicinal 1 adjacent, neighbouring. **2** (in organic chemistry) describing two (usually identical) atoms or groups attached one to each of two linked carbon atoms in a molecule. The presence of vicinal substituents is denoted by the prefix *vic-* attached to the name of the compound. Compare **geminal**.

vicilin a major storage protein in seeds of *Pisum sativum* (pea); it comprises 124 amino acids, M_r 170 000. Legumin-like and vicilin-like globulins are the main storage proteins of most angiosperms and gymnosperms.

vidarabine adenine arabinoside; 9- β -D-arabinofuranosyladenine; a

purine nucleoside, a metabolite of hypoxanthine arabinoside, produced by *Streptomyces antibioticus*. Its triphosphate derivative inhibits viral DNA polymerase and may be incorporated into viral DNA; it also inhibits DNA synthesis.

Vif *abbr.* for viral infectivity factor; a protein of HIV-1 that is essential for production of infectious viruses by T lymphocytes and macrophages.

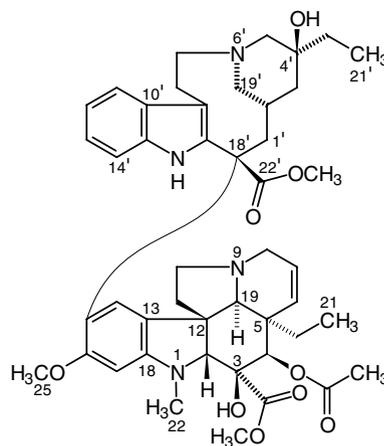

vigabatrin γ -vinyl- γ -aminobutyric acid; γ -vinyl GABA; 4-amino-5-hexenoic acid; an irreversible inhibitor of the enzyme GABA transaminase (**4-aminobutyrate transaminase**), which metabolizes the neurotransmitter γ -amino-*n*-butyric acid.

vigilin a protein derived from chickens that contains 14 **KH domains**. There is a human homologue.

villin a Ca^{2+} -regulated actin-binding protein occurring in the microvilli of intestinal epithelial cells and kidney proximal tubule cells. Villin consists of a large core fragment, the N-terminal portion, and a small head-piece, the C-terminal portion; the head-piece binds F-actin (see **actin**) strongly in both the presence and absence of Ca^{2+} ; it is similar to **gelsolin**.

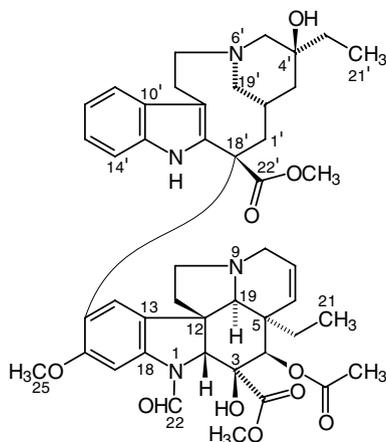

vimentin a protein found in class III **intermediate filaments** in mesenchymal and other non-epithelial cells, and in the Z disk of skeletal and cardiac muscle cells. It is a phosphoprotein, phosphorylation being enhanced during cell division.

vinblastine an alkaloid, $\text{C}_{46}\text{H}_{58}\text{N}_4\text{O}_9$, obtained from *Vinca rosea*, that binds to spindle microtubules and arrests metaphase of mitosis. It is used as an antineoplastic agent.

vinblastine

vincristine an alkaloid, $\text{C}_{46}\text{H}_{56}\text{N}_4\text{O}_{10}$, obtained from *Vinca rosea* and structurally related to **vinblastine**, that binds to spindle microtubules and arrests metaphase of mitosis. It is used as an antineoplastic agent.

vincristine

vinculin a cytoskeletal protein associated with the cytoplasmic face of the focal adhesion plaques that anchor actin microfilaments to the plasma membrane and that attach a cell to the substratum. It associates with **talin** in binding **integrins** to the cytoskeleton. Vinculin is phosphorylated (on serines, threonines, and tyrosines) and acylated by myristic acid and/or palmitic acid. Vinculin and metavinculin are produced by alternative splicing of the same gene. Metavinculin differs from vinculin in having a 68-residue additional domain near the C terminus.

vindoline the major alkaloid from *Vinca rosea*; $C_{25}H_{32}N_2O_6$. It is without physiological activity but constitutes a pentacyclic moiety of **vinblastine** and **vincristine**.

vinyl ether alk-1-enyl ether; a class of compounds characterized by a bond formed between a long-chain aldehyde and one (in the case of monoalk-1-enyl ethers) or two (for dialk-1-enyl ethers) of the hydroxy groups of the glycerol moiety of a glycerolipid; only the *sn*-1 isomers occur naturally, and chains of 16 or 18 carbons are usual. Such glycerophospholipids are known as **plasmalogens**; ethanolamine glycerophospholipids characteristically contain larger amounts of plasmalogens than other classes, and heart tissue is rich in plasmalogens.

γ -vinyl GABA *see* **vigabatrin**.

viosamine 4-amino-4,6-dideoxy-D-glucose; a component of the lipopolysaccharide of some strains of *Escherichia coli*.

VIP *abbr.* for vasoactive intestinal polypeptide.

VIP36 *abbr.* for vesicular integral membrane protein 36 kDa; a mannose-specific lectin protein that resides in the Golgi apparatus.

VIPoma a tumour producing **vasoactive intestinal polypeptide** (VIP). It is often associated with a watery diarrhoea and other pathological signs known as **Verner-Morrison syndrome**.

viral infectivity factor *see* **Vif**.

viral particle *see* **virion**.

viral RNA RNA that constitutes the genome of certain viruses – the RNA viruses. Examples are poliovirus, which has single-stranded RNA, and cytoplasmic polyhedrosis virus of the tussock moth, which has 10 double-stranded RNA molecules. All **retroviruses** contain RNA as the genome.

virino a former name for a putative type of particulate, noncellular, submicroscopic, transmissible, pathogenic agent, typified by the agent responsible for **scrapie**. The infective particle was believed to consist of a small nucleic-acid molecule covered with host-specified protein. *See* **prion**.

virion or **viral particle** a complete virus particle, found extracellularly and capable of surviving in crystalline form and of infecting a living cell. It comprises the nucleic-acid **core** and the protein **capsid**; the latter may be enclosed by an **envelope** in some viral families.

virogene *see* **oncogene hypothesis**.

viroid any of about 30 autonomously replicating plant pathogens that consist of single-stranded (ss) circular RNA (about 350 nt) containing much self-complementarity. They have no genes, so do not express protein. It is assumed that the viroid RNA acts as its own template, subverting host cell enzymes to carry out the replication. The product consists of concatamers of daughter strands that undergo self-cleavage to form new viroid RNA genomes. It is likely that hammerhead structures (*see* **ribozyme**) are involved. An example is potato spindle tuber viroid (PSTV). This is similar to human hepatitis delta, which is part viroid and part virus in that it replicates like a viroid and part of its genome is homologous with PSTV.

virology the scientific study of viruses and the diseases caused by them. —**virological** *adj.*; **virologist** *n.*

viropexis the process by which virus particles are adsorbed onto the surface of a cell and then taken into the cytoplasm.

virtual organization *see* **VO**.

virtual screening *an alternative name for* **combinatorial chemistry**.

virulence the capacity of a microorganism or virus to cause disease in a host under certain conditions. —**virulent** *adj.*

virulent phage a bacteriophage that invariably lyses the bacterium it infects. Virulent phages have no alternative but to follow the **lytic cycle**.

virus a noncellular infective agent that reproduces only in an appropriate host cell. Viruses are typically smaller than bacteria, and can infect animal, plant, or bacterial cells (*see* **bacteriophage**); many are important agents of disease. The infective particle (**virion**) consists of a core of nucleic acid (either DNA or RNA) surrounded by a protein **capsid** and, in some cases, an outer envelope. A virus can interact with its host cell in several different ways. In a lytic interaction the cell's replicative and protein biosynthetic apparatus is directed by the viral genes to produce numerous progeny virions, which are released upon disintegration of the host cell (*see* **lytic cycle**). However, in a persistent infection, low levels of virus production may be sustained without destruction of the host cell. In a **latent infection**, the virus resides in a host cell without replicating, although it may be provoked to enter the lytic phase by some stimulus. Oncogenic viruses, which include both DNA viruses and RNA viruses (**retroviruses**) carry **oncogenes** and are potentially capable of transforming their host cells into tumour cells. Animal viruses are classified according to the nature of their genome and the mechanism of synthesis of messenger RNA (*see* **Baltimore classification**).

virusoids *see* **satellite RNA**.

visceral layer *see* **serous membrane**.

viscometer or **viscosimeter** an apparatus for measuring the viscosity or resistance to flow of a liquid.

viscosity *symbol:* η ; the resistance to flow of a fluid due to the sum of the effects of adhesion and cohesion. Consider a liquid between two parallel plates, one of which is moving in the x direction with a velocity v . The liquid is thought of as a number of layers, each of which slides along the adjacent layer; the frictional resistance between adjacent layers generates a velocity gradient in the y direction. The deformation of the liquid produced by the velocity gradient is known as **shear** (def. 1). The frictional force, f , between the liquid layers is proportional to the area, A , of the layers and to the velocity gradient between them, such that $f = \eta A(dv/dy)$, where η is the **coefficient of viscosity** or simply the viscosity; $f/A = F$, the **shear stress**; and $dv/dy = G$, the **shear gradient** or **shear rate**. If η is independent of F or G , the fluid is a **Newtonian fluid**; if η is a function of F or G , the fluid is a **non-Newtonian fluid**.

viscotxin a pore-forming toxin, permitting passage of small molecules across biomembranes. It is produced by various plants. It contains 45–47 amino acid residues organized in two antiparallel α -helices and two antiparallel β -strands. It is classified in the TC system under number 1.C.44.

visinin a calcium-binding protein specific to cone photoreceptors; a chicken isoform homologous to bovine **recoverin** has three Ca^{2+} -binding sites.

Visual Basic *see* **programming language**.

visual cascade the sequence of reactions occurring after the absorption of a photon by visual pigment (e.g. **rhodopsin**). It eventually

leads to a rapid fall in cyclic GMP levels, which closes Na⁺ channels in the membrane of the visual receptor and activates the nerve impulse in the optic nerve. The activated pigment stimulates the G-protein **transducin**, which initiates the signal-transduction cascade.

visualization software 1 any software that facilitates analysis and interpretation of data using simple visual metaphors (e.g. graphs, trees, 3D images). **2** (*in structure analysis*) software that allows visualization of 3D representations of molecular structures from multiple perspectives, using multiple modes (e.g. backbone trace, space-filled, surface) and multiple colour schemes; examples include MAGE, RasMol, and Cn3D. **3** (*in sequence analysis*) software that allows visualization of sequence properties (such as hydrophathy profiles) or visualization and editing of sequence alignments: e.g. CINEMA (colour interactive editor for multiple alignments) and JalView.

visual pigment any of the homologous photosensitive retinal-containing transmembrane proteins of the retina that are responsible for vision. The rods contain **rhodopsin**, while the cones contain **cyanopsin**, **chloropsin**, or **porphyropsin**.

visual purple *see* **rhodopsin**.

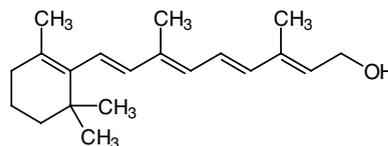

vitalem the doctrine that the phenomena of biology are due to a vital principle distinct from physicochemical forces, and cannot be explained by the laws of physics and chemistry alone. The accidental discovery, in 1890, by the brothers Büchner that a cell-free extract of yeast could catalyse alcoholic fermentation did much to convince adherents that such a doctrine was untenable. Also important was Wohler's synthesis of urea from ammonium cyanate in 1828.

vital staining a technique in which living cells or tissues are exposed to a stain that does not kill them. Dyes such as Trypan Blue are excluded from live cells but stain dead cells thereby allowing the proportion of each in a population to be counted using a hemocytometer. Alternatively, the tetrazolium dye MTT stains live cells blue without killing them.

vitamer any of two or more chemically and metabolically related compounds that display qualitatively the same biological activity as a vitamin. For example, retinol, retinal, retinoic acid, 3,4-didehydroretinol, and various carotenes are all vitamers of vitamin A.

vitamin an organic substance that is present in foodstuffs (or in intestinal bacteria) in relatively minute amounts, is distinct from the main organic components of food (i.e. protein, carbohydrate, and fat), and is needed for the normal nutrition of the organism (or species) in question. Deficiency or absence of any vitamin causes a specific deficiency disease. **Vitamins A, D, E, and K** are the fat-soluble vitamins; **vitamins B₁, B₂, B₆, B₁₂, and C**, plus **biotin, choline, folic acid, nicotinic acid**, and panthothenic acid (*see* **panthothenate**), are the water-soluble vitamins.

vitamin A 1 a common name for **retinol**. **2** a generic name for any retinoid exhibiting qualitatively the biological activity of retinol. Included, besides retinol (relative activity 100) are: **retinal** (91); **retinoic acid** (≈65); **3,4-didehydroretinol** (40); **3,4-didehydroretinal**; and **3,4-didehydroretinoic acid** (the activities relative to retinol being measured by the standardized growth test on vitamin A-deficient rats). Vitamin A is fat-soluble, and is present in various lipid-containing animal preparations, especially liver and dairy products. Vitamin A activity is displayed also by various carotenes; these are provitamins, being converted to retinal in the small intestine in most vertebrates. The vitamin A of commerce was originally an extract from fish-liver oils, which contain large amounts of retinol, principally as its palmitate; it is now largely derived chemically. Proper vitamin A nutrition is necessary for: (1) somatic function, including growth and differentiation, e.g. of epithelial structures and bone; (2) reproduction, including spermatogenesis, oogenesis, placental development, and embryonic growth; and (3) visual processes (*see* **retinal**, **3,4-didehydroretinal**). Vitamin A deficiency causes stunted growth, thickening of various membranes by keratinization, and night blindness, xerophthalmia, keratomalacia, and eventually complete blindness. In moderate excess, vitamin A is highly toxic.

vitamin A₁ an alternative name (not recommended) for **retinol**.

vitamin A₂ an alternative name (not recommended) for **3,4-didehydroretinol**.

vitamin A acid or **vitamin A₁ acid** an alternative name (not recommended) for **retinoic acid**.

vitamin A₂ acid an alternative name (not recommended) for **3,4-didehydroretinoic acid**.

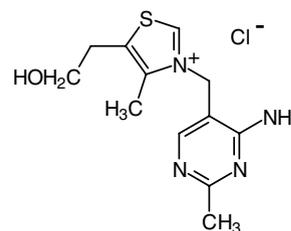

vitamin A alcohol or **vitamin A₁ alcohol** an alternative name (not recommended) for **retinol**.

vitamin A₂ alcohol an alternative name (not recommended) for **3,4-didehydroretinol**.

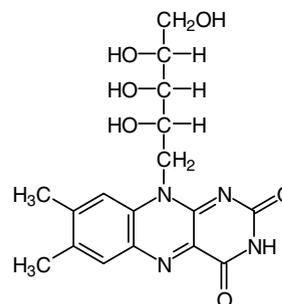

vitamin A aldehyde or **vitamin A₁ aldehyde** an alternative name for (not recommended) **retinal**.

vitamin A₂ aldehyde an alternative name (not recommended) for **3,4-didehydroretinal**.

vitamin B₁ or **thiamine** or (sometimes) **thiamin** or (formerly) **aneurin(e)** 3-(4-amino-2-methylpyrimidin-5-ylmethyl)-5-(2-hydroxyethyl)-4-methylthiazolium chloride; a water-soluble vitamin, present in fresh vegetables and meats, especially liver. Deficiency in humans causes beriberi, manifest as cardiopathy and neuropathy; in pigeons, a characteristic head-drop is an overt sign of deficiency. **Thiamine diphosphate** (*abbr.*: TPP), formerly known as **cocarcboxylase**, is a coenzyme for oxidative decarboxylation and other enzymic reactions, including ones catalysed by pyruvate and oxo-glutarate dehydrogenases, pyruvate decarboxylase, and transketolase.

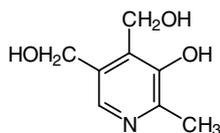

vitamin B₂ or **riboflavin** 6,7-dimethyl-9-ribitylisoalloxazine; formerly also called lactoflavin, hepatoflavin, ovoflavin, uroflavin, vitamin G, vitamin H. A water-soluble vitamin, present in most foods but especially in milk and meat products. It is a component of the **flavin nucleotide** coenzymes (e.g. FAD, FMN). Isolated from milk and eggs by Kuhn and co-workers in 1933 and chemically synthesized by them and others in 1935. Significant deficiency seldom

occurs, but causes changes of the tongue and lips and sores in the corners of the mouth.

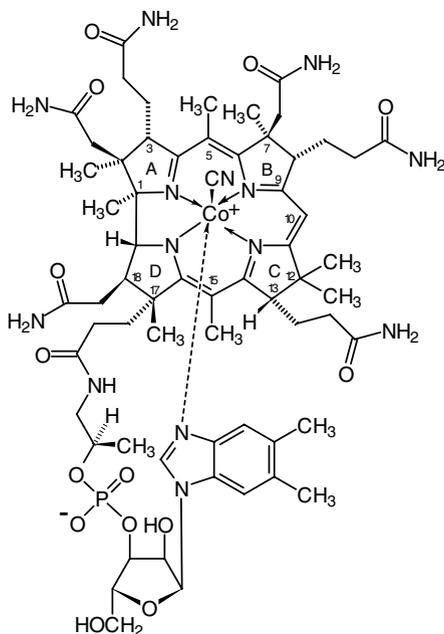

vitamin B₅ (*rarely*) an alternative name for pantothenic acid; see pantothenate.

vitamin B₆ or **pyridoxine** 2-methyl-3-hydroxy-4,5-bis(hydroxymethyl)pyridine; a water-soluble vitamin; **pyridoxal** and **pyridoxamine** are vitamers. It is present in many foods, including meats (largely as pyridoxal or pyridoxamine), and plant sources (largely as pyridoxine) such as cereals, lentils, nuts, and vegetables. Pyridoxal phosphate is a coenzyme for enzyme reactions including those for transamination, amino-acid decarboxylation, racemization, and modifications to amino-acid side chains. Deficiency is a minor problem and signs are difficult to produce.

vitamin B₆

vitamin B₁₂ or **cobalamin** or **cobamide** a water-soluble vitamin with several related forms characterized by possession of a **corrin** nucleus containing a cobalt atom. Four of the cobalt coordinate bonds are liganded by nitrogens of the four pyrrole rings found in the corrin nucleus; the fifth position is occupied by the ribonucleotide of 5,6-dimethylbenzimidazole, which is also linked via a 1-amino-2-propanol moiety to one of the pyrrole rings; the sixth position is variously occupied by a cyanide group (cyanocobalamin, the form in which the molecule was first isolated, the cyanide group having been introduced during extraction), or a methyl group (**methylcobalamin**, which is a coenzyme), or a 5'-deoxyadenosyl group (**deoxyadenosylcobalamin**, the other coenzyme form). Vitamin B₁₂ is present only in foods of animal origin, especially liver, fish, and

cyanocobalamin

eggs. The coenzyme forms are needed for: (1) reactions that require the deoxyadenosyl form, exemplified by **methylmalonyl-CoA mutase**; and (2) reactions that require the methyl form, exemplified by 5-methyltetrahydrofolate-homocysteine S-methyltransferase (EC 2.1.1.13) (*see* **5-methyltetrahydrofolate**). In normal individuals, deficiency rarely occurs, but is precipitated by lack of **intrinsic factor**, a protein secreted by gastric mucosa and required for efficient absorption of the vitamin. Lack of intrinsic factor leads to **pernicious anemia**, investigation of which first led to the discovery of cobalamin.

vitamin B_{12r}, reductase *see* **cob(II)alamin reductase**.

vitamin C ascorbic acid; a water-soluble vitamin, and the first vitamin to be recognized. Awareness of the ability of fresh vegetables and fruit to prevent **scurvy** is attributed to the British physician James Lind (1716–94), who published *A Treatise on Scurvy* in 1757. The active compound was first isolated in 1928 by Albert Szent-Györgyi (1893–1986; Hungarian-born US biochemist) as 'hexuronic acid', a strong reducing substance from rat adrenals and citrus fruits. This was shown four years later to be identical with the anti-scorbutic substance isolated by Zilva and associates. Vitamin C is widely distributed in vegetables and fruit, but easily destroyed by cooking. *See* **ascorbic acid** for structure. *See also* **1-gulonolactone oxidase**.

vitamin D any steroid that exhibits the biological activity of calcitriol (= vitamin D₃ – *see below*); the antirachitic vitamin. Such compounds are fat-soluble and structurally related to either the parent hydrocarbon, **cholestane**, or its 24-methyl derivative, ergostane, and all are 9,10-seco-sterols, i.e. 3-hydroxysteroids in which bond breakage has occurred between C-9 and C-10 in ring B of the steroid nucleus. Variants of vitamin D, with their recommended trivial names in parentheses, are: **vitamin D₂** or **calciferol** (**ercalciferol** or **ergocalciferol**), formed in plants by the action of UV light on the endogenous provitamin **ergosterol** and produced industrially by UV-irradiation of ergosterol isolated from yeast; **vitamin D₃** (**calcitriol** or **cholecalciferol**), occurring naturally in particularly high concentrations in the liver oils of certain fish, especially cod, halibut, or tunny, and produced nonenzymically in the skin of animals by the action of a UV component (230–313 nm) of sunlight on the provitamin 7-dehydrocholesterol; **vitamin D₄** (22,23-dihydroercalciferol or (24S)-methylcalciferol or (*formerly*) 22,23-dihydroergocalciferol), produced by irradiation of 22,23-dihydroergosterol; **vitamin D₅** ((24S)-ethylcalciferol); and **vitamin D₆** ((22E)-(24R)-ethyl-22,23-didehydrocalciferol). Of these variants, calciferol (D₂) and ercalciferol (D₂) are the most significant. Vitamin D activity is also displayed by several synthetic derivatives or isomers of calciferol (or of ercalciferol) and by the 25-hydroxylated and 1α,25-dihydroxylated metabolites **calcitriol** and **calcitriol** (or **ercalcitriol** and **ercalcitriol**). Calcitriol (or ercalcitriol) is formed in liver from calciferol (or ercalciferol) and converted in kidney to calcitriol (or ercalcitriol), the physiologically active form of vitamin D₃ (or D₂). Vitamin D mediates the absorption of calcium and phosphate ions from the intestine and promotes the mineralization of bone. The deficiency conditions of **rickets** (in children) and **osteomalacia** (in adults) may be treated by administration of the vitamin, commonly as D₂. Overdosage results in disturbances of calcium metabolism and ultimately leads to decalcification of bone. *See also* **calcitriol**. For structures see entries for individual compounds.

vitamin D binding protein *abbr.*: **DBP**; a multifunctional protein found in plasma and other body fluids, and on the surface of many cell types. In plasma it carries the vitamin D sterols. DBP binds membrane-bound immunoglobulin on the surface of B lymphocytes, and IgG Fc receptor on the membranes of T lymphocytes.

vitamin E α-tocopherol; a fat-soluble vitamin considered to act primarily as an antioxidant. Other tocopherols (*see* **tocopherol** for structure) have vitamin E activity. Vitamin E is thought to prevent the formation of lipid autoxidation products by trapping free radicals and thus preventing the chain reaction that leads to further peroxide formation. It is present in vegetable-seed oils, and also in meat, milk, and eggs. Deficiency occurs only in pathological states in which absorption is affected, and can result in premature red cell death. A relative deficiency may occur when the intake of polyunsaturated fatty acids is high unless the diet is supplemented with α-tocopherol.

vitamin F

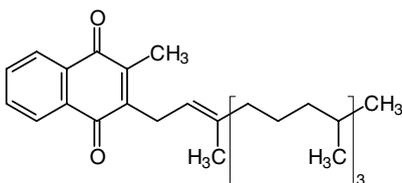

vitamin F (formerly) a collective term for essential fatty acids.

vitamin G an old name for riboflavin (i.e. vitamin B₂).

vitamin H 1 (sometimes) an alternative name for biotin. **2** an old name for riboflavin (i.e. vitamin B₂).

vitamin H₁ (sometimes) an alternative name for *p*-aminobenzoic acid.

vitamin K 2-methyl-3-phytyl-1,4-naphthoquinone; phyloquinone; 3-phytylmenadiol; vitamin K₁; a fat-soluble vitamin required for the synthesis of prothrombin and certain other blood coagulation factors. The **menaquinones** (vitamins K₂) are also active. Vitamin K is found in green leafy vegetables, meat, and milk. Deficiency is uncommon because it is produced by gut bacteria, but gut sterilization may trigger symptoms (decrease in plasma prothrombin) if intake is defective. Vitamin K is a cofactor in the post-translational formation of 4-carboxyglutamyl residues in certain proteins, e.g. **blood coagulation** factors VII, IX, X, and especially prothrombin, during which an epoxidase reaction converts vitamin K₁ to its epoxide form, which is converted back by a reductase. This reductase can be inhibited by **warfarin**, which thus reduces vitamin K₁ levels, thereby reducing prothrombin formation and so acting as an anticoagulant.

vitamin-K-epoxide reductase (warfarin-sensitive) EC 1.1.4.1; an enzyme that catalyses the formation of 2-methyl-3-phytyl-1,4-naphthoquinone, oxidized dithiothreitol, and H₂O from 3-epoxy-2,3-dihydro-2-methyl-3-phytyl-1,4-naphthoquinone and 1,4-dithiothreitol.

vitamin-like dietary factor any biomolecule that resembles the vitamins in its biological properties and is considered to be produced in inadequate amounts within an organism so that dietary supplementation may be recommended. The term includes: inositol, carnitine, lipoic acid, *p*-aminobenzoic acid, and ubiquinone.

vitellogenin the precursor protein of **lipovitellin** and **phosphitin**, a major egg-yolk protein synthesized in the liver of chickens and *Xenopus*. It has an *M_r* of 135 000, and is split in the ovary into its constituent proteins. In *Xenopus*, two genes, for vitellogenin I and II, are spread over more than 21 kbp of DNA, their primary transcripts consisting of 6 kbp of **pre-mRNA** with 33 **introns**. A related protein is found in *Drosophila melanogaster*.

vitronectin or serum spreading factor an adhesion protein, present in plasma and on the external surface of membranes of tissues, that promotes the adhesion of cells in tissue culture. The $\alpha_5\beta_3$ **integrin** binds vitronectin, fibrinogen, laminin, von Willebrand factor, fibronectin, and thrombospondin. The human precursor encodes an N-terminal signal, vitronectin, and somatomedin B (see **somatomedin**).

VI symbol for the valeryl group.

VLA a family of **integrins** all having the β_1 subunit. They comprise VLA-1, $\alpha_1\beta_1$ (β subunit also called VLA β , glycoprotein IIa or gpIIa, CD29; α subunit also called CD49a), which binds laminin (and collagen); VLA-2, $\alpha_2\beta_1$ (α subunit also called gpIa, CD49b), which binds collagen (and laminin); VLA-3, $\alpha_3\beta_1$ (α subunit also called CD49c), which binds fibronectin, laminin, and collagen; VLA-4, $\alpha_4\beta_1$ (α subunit also called CD49d), which binds VCAM-1 and fibronectin; VLA-5 (or fibronectin receptor), $\alpha_5\beta_1$ (CD49e), which binds fibronectin; VLA-6 (or laminin receptor), $\alpha_6\beta_1$ (CD49f), which binds laminin; $\alpha_7\beta_1$, which binds laminin; $\alpha_8\beta_1$, ligand doubtful; and $\alpha_v\beta_1$ (α subunit also called vitronectin receptor subunit, CD51), which binds fibronectin.

VLDL abbr. for very-low-density lipoprotein.

VLGR-1 abbr. for very large G-protein-coupled receptor 1; a large cell-surface protein (~5500 amino acids) that is highly expressed in the developing central nervous system of mouse. The C-terminal re-

volutin granule

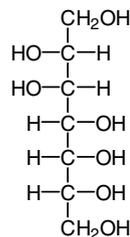

gion contains seven transmembrane segments and is G-protein-coupled. The extracellular region contains a tandem array of 20 repeats similar to those present in Calx of *Drosophila* (see **Calx**) and in their middle, seven repeats like those present in the C-terminal region of **epitempin**. The human gene is located in a region linked to a form of familial febrile convulsions.

VMA abbr. for vanillylmandelic acid; see **hydroxymethoxymandelate**.

VO abbr. for virtual organization; a concept derived from computer science and comprising people from a variety of actual organizations. One example of a VO would be those involved in different aspects of a large engineering design project. Another would be those involved in, for example, a large genome annotation project.

void volume 1 (in column chromatography) the volume of the mobile phase, i.e. total **bed volume** of the column minus the volume occupied by the support particles. **2** (in gel chromatography) or **exclusion volume** the volume of the mobile phase passing through the gel required to elute a molecule that never entered the stationary phase.

volemitol D-glycero-D-talo-heptitol; a polyol widely distributed in plants, fungi, and lichens, and used as a sweetening agent.

volkensin a ricin-like toxic glycoprotein from the roots of *Adenia volkensii*, a Kenyan shrub. It consists of two subunits, A (*M_r* 29 000) and B (*M_r* 36 000), linked by disulfide bonds.

volt symbol: V; the SI derived unit of electric potential or electromotive force. It is equal to the difference in electric potential between two points on a conductor carrying a constant current of one ampere when the power dissipated between the points is one watt. 1 V = 1 W A⁻¹ = 1 J C⁻¹. [After Alessandro Volta (1745–1827), Italian physicist.]

voltage-gated ion channel a cell-membrane channel whose opening is governed by the membrane potential.

voltage-gated K⁺ channel or **KCNQ** any of a family of membrane proteins that form K⁺ selective channels that contain six transmembrane segments and intracellular N- and C-termini. The channels open when a change in voltage occurs across the membrane. Mutations in KCNQ1 are common in hereditary **long QT syndrome**. Mutations in KCNQ2 and KCNQ3 cause autosomal dominant familial neonatal convulsions. KCNQ4 mutations cause a form of hereditary deafness.

voltage sensor the fourth transmembrane segment (S4) of shaker-type ion channels. It contains lysine or arginine in every third position and is involved in opening the channel at the permissive voltage. See **shaker**.

voltmeter an old term for **coulometer**.

voltametry an old term for **coulometry**.

voltammetry an electroanalytical procedure for identifying and determining the concentrations of various ions in solution by studying the relation between a varied electric potential applied between two electrodes immersed in a test solution and the resultant faradaic current. It includes **anodic stripping voltammetry** and **polarography**. — **voltammetric adj.**; **voltammetrically adv.**

volume of distribution symbol: *V_d*; the theoretical volume of fluid in which a specified dose of drug is distributed, based on measurement of the concentration of free drug (i.e. that not bound to plasma proteins) in plasma. *V_d* = *Q*/*C_p*, where *Q* is the amount of drug administered and *C_p* is the concentration in plasma.

volutin granule or **metachromatic granule** an electron-dense cytoplasmic inclusion found in various bacteria, yeasts, and other microorganisms. It exhibits **metachromasia** on staining with certain

basic dyes, contains polymetaphosphate, and is believed to serve as a phosphate store. *See also* **Babes–Ernst body**.

von Gierke's disease *see* **glycogen disease**.

von Willebrand factor *abbr.*: vWFA; a blood protein involved in clotting. It performs two important hemostatic functions: it links specific platelet membrane receptors to collagen, and possibly other components of subendothelial connective tissue, so mediating platelet adhesion to sites of vascular damage; and it binds to, and stabilizes, factor VIII (*see* **blood coagulation**). Deficiency results in bleeding from skin, owing to failure of platelet adhesion, with a prolonged bleeding time, and also results in spontaneous bleeding into joints and soft tissues as a result of the secondary factor VIII deficiency, caused by the instability of factor VIII. The primary translation product, synthesized by vascular endothelial cells and megakaryocytes, is a protein of 2813 amino acids (309.29 kDa). The human precursor protein encodes a signal peptide, a peptide that is cleaved off and is known as **von Willebrand antigen II**, and the mature protein itself; cysteine is the most abundant amino acid. Before the mature factor is secreted from cells of origin, many intermolecular disulfide bridges between vWF molecules are formed that lead to a complex that may vary in mass from dimers of ~500 kDa to species of more than 20 megadaltons. Inherited defects of vWF affect nearly 1% of the population, but most are not clinically significant. The majority of patients have a quantitative deficiency of vWF, with autosomal dominant inheritance, and are known as type I. Type II variants have an abnormal vWF. In vWF deficiency (*abbr.*: vWD), type IIA intermediate and large complexes are absent. Mutations cluster near Tyr⁸⁴²-|-Met⁸⁴³, a site that is sensitive

to proteolysis. vWD type III is rare, and is a severe autosomal recessive disease characterized by virtual absence of vWF, in some cases known to be the result of total or partial deletion of the vWF gene. Unactivated platelets bind vWF through gpIb–IX complex, deficiency of which leads to a bleeding disorder, **Bernard-Soulier syndrome**. After activation, platelets bind vWF through the **integrin** gpIIb–IIIa complex, which is defective in **Glanzmann thrombasthenia**, another bleeding disorder. [After Erik Adolph von Willebrand (1870–1949), Finnish physician.]

V-PARP *abbr. for* vault-poly(ADP-ribose) polymerase; in mammals, a 193 kDa protein that contains a domain homologous to the catalytic domain of **PARP-1**. It binds to, and uses as substrate, MVP of **vaults**, and is also localized to the mitotic spindle. It does not appear to require DNA for activity.

V8 proteinase *see* **glutamyl endopeptidase**.

vps *abbr. for* **vacuolar sorting protein**.

vps34 *or* **vacuolar sorting protein 34** a protein-trafficking protein involved in the sorting and segregation of vacuoles. It is a homologue of **1-phosphatidylinositol 3-kinase**, having that enzymic activity, which may be the mechanism by which it acts. It is, in turn, activated via phosphorylation by a serine/threonine protein kinase, vps15.

VRE *abbr. for* **vancomycin-resistant Enterococcus**. It is a drug-resistant pathogen (*compare* **MRSA**) found in hospital populations of bacteria. The resistance arises from modification of the peptidoglycan precursor that is the target for vancomycin.

Wrille a basic leucine zipper transcription factor of *Drosophila* that represses Clock.

v-yes *see* **YES**.

Ww

w symbol for **1** mass fraction. **2** work (alternative to *W*). **3** speed (alternative to *u*, *v*, or *c*). **4** (bold italic) velocity (alternative to *v*, *u*, or *c*).

W symbol for **1** watt. **2** a residue of the α -amino acid L-tryptophan (alternative to Trp). **3** a residue of an incompletely specified base in a nucleic-acid sequence that may be adenine or may be thymine (in DNA) or uracil (in RNA). **4** a residue of the minor nucleoside **wyosine** (alternative to Y). **5** tungsten.

W symbol for **1** weight (alternative to *G* or *P*). **2** work (alternative to *w*). **3** radiant energy (alternative to *Q*). **4** writhing number.

W3 *abbr.* for World Wide Web. See **WWW**.

Waardenburg syndrome an autosomal dominant syndrome of developmental defects in and around the eyes, pigmentary defects in eyes and hair, and congenital deafness. Types 1 and 3 are caused by mutations in *PAX-1* and *PAX-3*. Type 3 also shows limb muscle hypoplasia. Type 2 is caused by mutations in **MITF**; type 4 is associated with **Hirschsprung disease**, and is caused by mutations in *SOX10*. [After Petrus Waardenburg (1886–1979), Dutch ophthalmologist.]

WAGR *abbr.* for Wilm's tumour, aniridia, ambiguous genitalia, and mental retardation; a contiguous gene syndrome resulting from a deletion in chromosome 11p13.

WAK1 *abbr.* for wall-associated kinase 1; a single-pass plasma membrane protein of plants, whose N-terminal region interacts with the cell wall while the intracellular region is a protein kinase.

Walden inversion the inversion of the configuration at a chiral centre in a bimolecular nucleophilic substitution reaction. [After its discoverer, Paul Walden (1863–1957), Latvian chemist.]

Waldenström's macroglobulinemia a lymphoid tumour that arises from the most mature B lymphocytes and invariably produces IgM, which appear as a **paraprotein**. [After Jan Goesta Waldenström (1906–1996), Swedish physician.]

Walker motif either of two sequence motifs in proteins that bind and hydrolyse nucleoside triphosphates. Walker-A (or P-loop) consists of the sequence A/GX4GKT/S (in one-letter code), is flanked by a beta strand and an alpha helix, and loops around the triphosphate moiety. Walker-B consists of X4D (where X is almost exclusively a hydrophobic residue), occurs at the end of a beta strand, and interacts with the Mg²⁺ ion of the triphosphate moiety. [After John Walker (1941–), British biochemist who discovered them in H⁺-transporting ATPase of mitochondria.]

wall effect 1 (*in centrifugation*) the collision of sedimenting molecules with the wall of the cell. This occurs because the centrifugal field is radial, so can be avoided by using sector-shaped cells. **2** (*in chromatography*) the curving and spreading of a zone as it migrates down a chromatographic column because of inhomogeneities in solvent flow near the wall of the column.

Warburg apparatus a sensitive, constant-volume respirometer for measuring gas exchange of cells, homogenates, or tissue slices. It consists of a small flask, with one or more side arms for the addition of reagents, and a centre well, connected to a U-tube manometer of about 1 mm² internal cross-section, fitted with a reservoir for manometer fluid. The vessel is immersed in a constant temperature bath and shaken continually to equilibrate the gas in the liquid phase, where the reaction is taking place, with the gas phase, where the reaction is being measured. It was used extensively for metabolic studies before the wide availability of radioactive tracers, but is now virtually obsolete. [After Otto Heinrich Warburg (1883–1970), German physiologist and biochemist.]

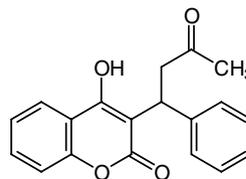

Warburg–Dickens–Horeck pathway or **Warburg–Dickens pathway** an alternative name for **hexose monophosphate pathway**.

Warburg effect 1 the relative overproduction of lactate that occurs in many tumours. **2** the inhibitory effect of high oxygen concentrations on photosynthesis.

Warburg's enzyme an alternative name for old yellow enzyme; see **yellow enzyme**.

warfarin 3-(α -phenyl- β -acetylthyl)-4-hydroxycoumarin; 1-(4'-hydroxy-3'-coumarin-3'-yl)-1-phenylbutan-3-one; an anticoagulant

and rodenticide. It inhibits the reductase that converts the epoxide form of **vitamin K** to its reduced form, which is a cofactor for the production of the 4-carboxyglutamyl residues of, among other proteins, the **blood coagulation factors II** (i.e. prothrombin), VII, IX, and X. [From the name of the patentees, Wisconsin Alumni Research Foundation, + coumarin.] See also **vitamin-K-epoxide reductase (warfarin-sensitive)**.

Waring blender the proprietary name for a blender used in the preparation of tissue homogenates. It consists of a hydrodynamically designed vessel (of tetrafoil cross-section) in the bottom of which a specially shaped blade rotates at high speed. [After the manufacturers, Waring Products Corporation.]

washing soda see **soda**.

WASP *abbr.* for Wiskott–Aldrich syndrome protein; any of a small family of proteins including WASP1 (whose expression is limited to lymphocytes and platelets) and N-WASP (which is more widely expressed but especially in neurons). They bind small GTPases and phospholipids through their N-terminal regions and are homologous in their C-terminal regions. They activate the **Arp2/3 complex** and help in actin filament nucleation. Over 20 mutations of a locus at Xp11.23–p11.22 for WASP (501 amino acids) are associated with the Wiskott–Aldrich syndrome of severe thrombocytopenia and defective immunity.

Wasserman reaction a complement-fixation test for human blood and cerebrospinal fluid, widely used to detect syphilitic infection, although false positive reactions are often given by yaws, leprosy, paroxysmal hemoglobinuria, and malarial infection. The antigen on which the test is based is **cardiolipin**. [After August von Wassermann (1866–1925), German bacteriologist.]

Watanabe rabbit a breed of rabbits suffering from high blood cholesterol levels as a result of mutation of the low-density lipoprotein (LDL) receptor gene. It is used as an animal model for familial hypercholesterolemia.

water balance (of an organism) the **water intake** (as a liquid, the water in food, and water of oxidation) less the **water output** (water in urine, feces, or other excreta, water expended in saturating respired air, water lost through the integument).

waterfall sequence an alternative name for **cascade sequence**.

water regain (of an ion-exchange resin) for cationic resins, the weight of water taken up by 1 g dry resin in the hydrogen form; for anionic resins, the weight of water taken up by 1 g dry resin in the chloride form.

water-soluble B an old name for a fraction rich in water-soluble vitamins prepared from egg yolk.

Watson–Crick model of DNA a model for one form of DNA consisting essentially of two antiparallel helical polynucleotide strands coiled around the same axis to form a double helix. The deoxyribose-phosphate backbones lie on the outside of the helix and the purine and pyrimidine bases lie approximately at right angles to the axis on the inside of the helix. The diameter of the helix is 2.0 nm and there is a residue on each chain every 0.34 nm in the *z* direction. The angle between each residue on the same strand is 36°, so that the structure repeats after 10 residues (3.4 nm) on each strand. The two strands are held together by hydrogen bonds between pairs of bases that are complementary and opposing (i.e. on different strands). Adenine pairs with thymine and guanine with cytosine. The two chains are therefore complementary. Watson and Crick's

paper, published in *Nature* in 1953, also contained a prescient statement: 'It has not escaped our notice that the specific pairing we have postulated immediately suggests a possible copying mechanism for the genetic material.' This structure has stood the test of time. It is difficult to exaggerate the importance of the short paper. To quote from L. Stryer's *Biochemistry* (fourth edition), 'This brilliant accomplishment ranks as one of the most significant in the history of biology because it led the way to an understanding of gene function in molecular terms.' See also **double helix**. [After James Dewey Watson (1928–), US biologist, and Francis Harry Crick (1916–2004), British molecular biologist.]

Watson strand the upper strand in representations of double-stranded DNA sequences. Open reading frames (ORFs) may occur on either strand of a genomic DNA duplex and it is convenient to distinguish between the strands in order to specify specific ORFs. ORFs in the Watson strand of the yeast genome, for example, are given the suffix W, as in the systematic name YLR451W for the *LEU3* gene on yeast chromosome XII. Compare **Crick strand**. [After J.D. Watson.]

watt *symbol*: W; the SI derived unit of power or radiant flux; it is the power dissipated when one joule is expended in one second; i.e. $1 \text{ W} = 1 \text{ J s}^{-1}$. [After James Watt (1736–1819), British engineer.]

wave function *symbol*: ψ or w or Φ or ϕ ; the amplitude of the wave associated with a particle, e.g. an electron, as obtained from the Schrödinger wave equation. The square of the value of ψ at any point is proportional to the probability of finding the particle at that point.

wavelength *symbol*: λ ; the distance between successive points of equal phase of a wave. Wavelength is equal to the velocity of the wave motion divided by its frequency. For electromagnetic radiation, $\lambda = c_0/\nu$, where c_0 is the velocity of light *in vacuo* and ν the frequency of the radiation.

wavenumber or **repetency** for an electromagnetic radiation (e.g. light), the reciprocal of the **wavelength**; i.e. the number of waves in unit distance. Compare **kaysar**.

wax 1 any lipid fraction from living organisms or from crude petroleum that is a plastic substance, hard when cold, easily moulded when warm, and insoluble in water. **2** any fatty-acid ester of a long-chain monohydroxy alcohol.

wax synthase see **long-chain-alcohol O-fatty-acyltransferase**.

Wb *symbol* for weber.

WBC or **wbc** or **w.b.c.** *abbr.* for white blood cell(s); see **leukocyte**.

WC *abbr.* for **white collar**.

WD40 or **WD repeat** or **WD40 repeat** a conserved protein sequence of ≈ 40 amino acids that typically ends in tryptophan–aspartate (WD in the one-letter code for amino acids). The WD40 protein family comprises many regulatory or adaptor proteins involved in signal transduction, and its members may have one or several WD40 repeats. WD40 mediates protein–protein interaction. Examples are: the β subunits of trimeric G-proteins, the β subunit of protein phosphatase 2A, Apaf-1, and SCAP.

WDHA syndrome *abbr.* for watery diarrhoea, hypokalemia, plus achlorhydria syndrome; i.e. **Verner–Morrison syndrome**.

WD repeat see **WD40**.

weak interactions noncovalent interactions between molecules and parts of molecules, including charge–charge interactions, those involving permanent dipoles, van der Waals forces, and hydrogen bonds. They are particularly important in protein and nucleic-acid structure.

weber *symbol*: Wb; the SI derived unit of magnetic flux. It is equal to the flux that, linking a circuit of one turn, produces in it an emf of one volt as it is reduced to zero at a uniform rate in one second; i.e. $1 \text{ Wb} = 1 \text{ V s}$. [After Wilhelm Eduard Weber (1804–91), German physicist.]

wee1 a gene in *Schizosaccharomyces pombe* encoding a protein kinase (EC 2.7.1.112) that can phosphorylate tyrosine and serine/threonine residues. In yeast it phosphorylates a tyrosine of cdc2; in the human it phosphorylates a tyrosine and a threonine of the equivalent protein. It has conserved catalytic domains of the serine/threonine type of protein kinase, and is a negative regulator for entry to mitosis; it closely resembles the corresponding human homologue. See also **cdc gene**.

weight average molecular mass *old name* for mass average molar mass; see **average molar mass**.

weight matrix *an alternative name* for **scoring matrix**.

Weigle reactivation see **W reactivation**.

Weiss unit a measure of T4 DNA ligase activity based on ATP–PP_i exchange. One unit is the amount of enzyme required to catalyse the exchange of one nanomole of ³²P from ³²PP_i into ATP as **Norit-adsorbable** material in 20 min at 37°C. ATP and ³²P labelled ATP are adsorbed by Norit and recovered by filtration in this bound state for counting of radioactivity.

Werner syndrome a rare autosomal recessive disorder characterized by premature formation of cataracts, scleroderma-like skin, short stature, greying hair and hair loss, a generalized appearance of premature ageing, and a high risk of malignancy. It is caused by mutations in the Werner syndrome gene product (see **WRNp**). [After Otto Werner (1879–1936), German physician.]

Wernicke–Korsakoff syndrome a combination of **Wernicke's disease** (gliosis and capillary proliferation leading to ocular manifestations and polyneuropathy) and **Korsakoff's psychosis** (difficulty in recording and retaining new impressions). Wernicke's disease is due to vitamin B₁ deficiency, and manifests particularly in patients with a genetic abnormality in transketolase resulting in its reduced affinity for thiamine diphosphate. In such patients, even mild B₁ deficiency, as often occurs in alcoholics, may produce symptoms. [After Karl Wernicke (1848–1905), German alienist, and Sergei Sergeevich Korsakoff (1854–1900), Russian neurologist.]

Western blotting a technique for **blotting** proteins onto nitrocellulose, nylon, or other **transfer membrane** after they have been resolved by gel electrophoresis. The proteins can then be detected by autoradiography (if labelled), or through binding to fluorescently labelled, ¹²⁵I-labelled, or enzyme-linked (see **ELISA**) antibody, lectin, or other specific binding agent. The name derives by extension through the cardinal points from **Southern blotting**, the first such blotting technique, with a capital initial by similar extension.

Whitaker plot a plot that, ideally, gives a linear correlation between the logarithm of the relative molecular mass of a macromolecule and the ratio of the **elution volume**, V_e , to the **void volume**, V_o , when the macromolecules in solution are passed through a suitable **gel filtration** column; i.e. $\log M_r = V/V_o$. [After John Robert Whitaker (1929–), US biochemist.]

white adipose tissue or **white fat** a tissue developed particularly in mammals and birds to store fat as triacylglycerols to supply energy to the whole animal. The cells contain a single large droplet of fat that, in the nourished state, fills most of the cell. The nucleus lies in the narrow band of cytoplasm around the periphery. Adipose tissue is found in many parts of the body but is concentrated under the skin (subcutaneous) and around internal organs (heart and kidney). Compare **brown adipose tissue**.

white blood cell see **leukocyte**.

white coat effect the effect of the presence of the investigator on the accurate measurement of the blood pressure of a subject.

white collar *abbr.*: WC; a circadian blue-light photoreceptor that binds to the promoter of the clock component called frequency in the fungus *Neurospora crassa*. It is a light sensor and a DNA-binding transcription factor. WC-1 and WC-2 are zinc-finger proteins that function as a complex.

white fat see **white adipose tissue**.

white muscle pale, skeletal, usually involuntary muscle that is relatively deficient in myoglobin and cytochromes. Compare **red muscle**.

whole genome PCR a method whereby genomic DNA is converted to a form that can be amplified by the **polymerase chain reaction** (PCR). DNA is reduced to small fragments by restriction enzyme digestion or sonication, and adaptors are ligated to their ends. Oligonucleotides specific for the adaptors can be used for PCR amplification of the fragments. The technique can be used to identify individual fragments capable of binding transcription factors or other DNA-binding proteins using antibodies specific for the protein concerned.

WIBR *abbr.* for Whitehead Institute for Biomedical Research; see **sequencing centre**.

widow (*in a sequence alignment*) an amino acid residue or nucleotide base isolated from neighbouring residues or bases by spuri-

ous gaps at each side, usually the result of overzealous gap insertion by automatic alignment programs.

WIF-1 *abbr.* for Wnt-inhibitory factor-1. *See* **Wnt**.

WIF domain *see* **Wnt inhibitory factor 1**.

wild-type the **phenotype** that is characteristic of most of the members of a species occurring naturally and contrasting with the phenotype of a **mutant**. *Compare* **auxotroph**.

Williams-Beuren syndrome an autosomal dominant contiguous gene deletion disorder involving over 17 genes on chromosome 7 and characterized by a broad spectrum of abnormalities. The gene at 7q11.23 for FKBP6 (a component of the synaptonemal complex) is frequently part of the deletion. [After J.C.P. Williams (1900–), New Zealand cardiologist and Alois J. Beuren (1919–1984), German cardiologist.]

Wilm's tumour or **nephroblastoma** a malignancy in human infants (incidence 1 in 10000) associated with protein **WT33**. [After Marx Wilms (1867–1918), German pathologist.]

Wilson ATPase *see* **Wilson disease**.

Wilson's disease or **hepatolenticular degeneration** a rare autosomal recessively inherited disease characterized by degenerative changes in the brain, particularly in the basal ganglia, and cirrhosis of the liver. There are excessive deposits of copper in the liver, brain, cornea, and kidney; the serum copper is usually low and there is a **ceruloplasmin** deficiency. Patients may be effectively treated with British antilewisite (**dimercaprol**) or other chelating agents. [After (Samuel Alexander) Kinnier Wilson (1878–1937), US-born British neurologist.]

Wilzbach method a method for the random labelling of a compound with tritium by exposing it to isotopically pure tritium gas in a sealed container for several weeks. The exchange is promoted by the radiation.

winding angle (of double-stranded DNA) the angle of rotation between successive base pairs.

winding number the number of turns in a closed-circular double-stranded DNA measured relative to a surface on which the DNA lies. *See also* **supercoil**.

windows counter a counter for radioactive (or X-ray) ionization in which the sample (or source) is not separated from the detector by a membrane or 'window'.

wingless a gene in *Drosophila melanogaster* that encodes a protein in the **WNT family**, probably a growth factor that acts on neighbouring cells to regulate the **engrailed** gene. A homologue is present in the brachiopod *Terebratulina retusa*.

Wiskott-Aldrich syndrome a syndrome of thrombocytopenia, eczema, and immunodeficiency, with increased risk of malignancy. It is caused by mutations in a protein (*see* **WASP**) encoded on the X chromosome. [After Alfred Wiskott (1898–1978), German paediatrician, and Robert Anderson Aldrich (1917–), US paediatrician.]

Wiskott-Aldrich syndrome protein *see* **WASP**.

WIT *abbr.* for what is there; *see* **pathway database**.

WNK any of a family of protein serine/threonine kinases, first described in the rat, that have cysteine in place of lysine at a key position in the active site and contain two coiled-coil domains. The human WNK1 (gene on chromosome 12p) shows 86% sequence identity with the rat protein. Large deletions in the first intron increase expression of the protein and cause pseudohypoaldosteronism type II (an autosomal dominant hypertension, hyperkalemia, and metabolic acidosis). hWNK4 (gene on chromosome 17) is highly homologous with hWNK1. Several missense mutations cause pseudohypoaldosteronism type II. Both proteins localize to the distal nephron, hWNK1 being cytoplasmic, while hWNK4 is associated with tight junctions.

Wnt *abbr.* for (*Drosophila*) Wingless/Int-1; any of a family of secreted signalling glycoproteins found throughout the animal kingdom. They are important for patterning and development in the embryo and for regulation of cell proliferation thereafter. Wnt-1 is expressed in the central nervous system. On binding to G-protein-coupled receptors of the **Frizzled** family in the plasma membrane, they cause inactivation of **GSK-3**, which is complexed with APC protein, axin, and β -catenin, and targeted for ubiquitination and proteosomal degradation. In the extracellular space they are inhibited by binding Wnt-inhibitory factor-1 (WIF-1).

WNT family a family of secreted glycoproteins (e.g. WNT-2 from human and mouse) that are signalling molecules in tissue development. They act through G-protein-associated membrane receptors of the frizzled family to inhibit glycogen synthase kinase 3. The **WNT-1** gene is closely homologous to **wingless**.

Wnt inhibitory factor 1 *abbr.*: WIF-1; a secreted protein that contains an N-terminal WIF domain (≈ 150 amino acids), which binds and inhibits Wnt proteins; five EGF-like repeats; and a short hydrophilic domain in the C-terminal region. Homologues are present in many animals. The WIF domain is related to the extracellular domain of **Ryk** receptor tyrosine kinases. .

wobble base the third base in the anticodon of **transfer RNA** (5' end). It can bind to one of several possible bases at the 3' end of the codon in mRNA. *See also* **wobble hypothesis**.

wobble hypothesis the hypothesis that in **translation** (during protein synthesis) a less strict specificity in the base pairing of the 5' base of the anticodon of **transfer RNA** (tRNA) allows it to make alternative hydrogen-bonding with the third base of the codon of messenger RNA (mRNA) beyond the usual G-C and A-U pairings. Thus, anticodon U may recognize A or G and anticodon G may recognize C or U. Although the hypothesis has been fully supported by experiment, UGG and AUG are the only examples of the first type of wobble, and no examples of the second type are known. The presence of bases other than U,A,G, or C at the anticodon 5' position also contributes to more general pairing at this position. Thus, bases such as **wyosine**, **queuosine**, and **inosine** may be present (I always substitutes for A) with less strict pairing constraints. The degeneracy at the third codon position is consistent with the fact that about 40 different tRNA molecules interact with the 61 possible sense codons.

Wolcott-Rallison syndrome *see* **PERK**.

Wolfgram proteolipid protein one of the three principal classes of central nervous system **myelin protein**, extractable by chloroform: methanol (2:1, v/v), and consisting of three main fractions of 235, 54, and 62 kDa. *Compare* **Folch-Lees protein**. [After F. Wolfgram, who first discovered it.]

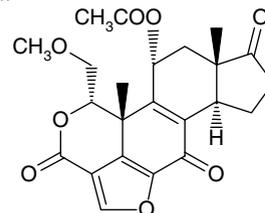

Wolf-Hirschhorn syndrome a syndrome of multiple malformations with mental and developmental defects. It is caused by deletion of the gene for **NELF-A**. [After Ulrich Wolf (1933–), German physician and Kurt Hirschhorn (1926–), US physician.]

Wolman disease a rapidly fatal autosomal recessive disease of infancy in which there is massive accumulation of cholesterol esters and triacylglycerols in most tissues. It is associated with mutations that lead to complete elimination in the activity of lysosomal **acid lipase**. [After Moshe Wolman (1914–), Israeli pathologist.]

work *symbol*: W or w ; the transfer of energy expressed as the product of a force, F , and the distance, s , through which its point of application moves in the direction of the force; i.e. $W = \int F ds$. The SI unit of work is the joule. The manifestation of work in productive form usually involves transduction by a mechanical device of the action of a force through a distance. A relationship between the work done on (or by) a system of constant mass, the heat it gains (or loses), and the change in the internal energy of the system is provided by the first law of thermodynamics (*see* **thermodynamics**).

World Wide Web *abbr.*: WWW or W3; the world-wide network of information (including biochemical and molecular biological data) stored on computers linked to the Internet, and made accessible for visualization and interrogation by browser software.

wortmannin or **MS-54** or **KY 12420** a potent and specific inhibitor of phosphatidylinositol 3-kinase, derived from the fungus *Penicillium funiculosum*.

W reactivation or Weigle reactivation or (*formerly*) UV reactiva-

tion the phenomenon whereby the survival of UV-irradiated bacteriophage is higher in a UV-irradiated host than in an unirradiated host. [After Jean Jacques Weigle (1901–68), who discovered it and described it in 1953.]

writhing number *symbol:* W; an index of the superhelical coiling of DNA, termed **writhe**. The writhing number and the **twist number** between them determine the **linking number** (L). The writhing number does not have a precise quantitative definition, but represents the degree of supercoiling. A decrease in L involves some decrease in supercoiling, and an increase in L an increase in supercoiling. *See also* **supercoil**.

WRNp *abbr. for* Werner syndrome gene product; *other name:* RECQL3. A RecQ helicase (1432 amino acids) of humans that has 3'→5' exonuclease activity and binds to the ssDNA-binding protein replication protein A. Over a score of mutations cause **Werner syndrome**.

wt or **wt.** *abbr. for* weight.

WT33 a protein that is related to **early growth response proteins**, and is associated with **Wilm's tumour**; it is probably a tumour suppressor. Certain mutations are also associated with Denys–Drash syndrome. Its sequence contains alternative splice sites and a zinc finger.

w/v or **wt/vol.** *abbr. for* weight per unit volume (of a solution or mixture).

w/w or **wt/wt** *abbr. for* weight per unit weight (of a solution or mixture).

WW domain or **WWP domain** a small motif characterized by two conserved tryptophan residues (spaced ~20–23 amino acid residues apart) and a conserved proline, hence its alternative name. It is

found in various disparate proteins, including vertebrate YAP protein, mouse NEDD-4, **utrophin** and **dystrophin**, the protein encoded by the gene responsible for **Duchenne muscular dystrophy**. The domain contains ~35–40 residues, which fold as a triple-stranded β -sheet, and may be repeated several (up to 4) times. It binds proteins that contain specific proline motifs ([AP]-P-P-[AP]-Y), and bears some resemblance to **SH3 domains**. It is often associated with other domains characteristic of proteins involved in signal transduction.

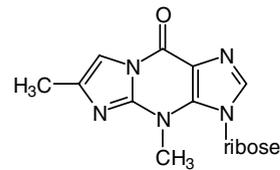

WWE motif *see* **deltex**.

wwPDB *abbr. for* Worldwide Protein Data Bank; *see* **composite database**.

WWP domain *another name for* **WW domain**.

WWW *abbr. for* **World Wide Web**.

wyosine *symbol:* W or Y; any modified form of guanosine present in the anticodon loop of some species of **transfer RNA**. They are based on the structure N^2 -(2-methyletheno)guanosine, and carry varying side chains on the five-carbon imidazo ring. The structure of one such compound is shown. *See also* **minor nucleoside**.

Xx

x *symbol for 1* amount-of-substance fraction (i.e. mole fraction) or number fraction for condensed phases. *Compare y. 2* a cartesian space coordinate, complementary to *y* and *z*.

X *symbol for a* a residue of an unknown, unspecified, or (specified) unusual α -amino acid (alternative to Xaa). **b** a residue of the ribonucleoside **xanthosine** (alternative to Xao).

X *symbol for* (electric) reactance.

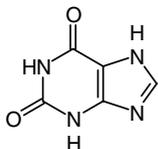

X-537A *an alternative name for lasaloacid.*

Xaa *symbol for* a residue of an unknown, unspecified, or (specified) unusual α -amino acid (alternative to X).

Xan *symbol for* a residue of the purine base **xanthine**.

xanthan gum a capsular complex heteropolysaccharide formed by strains of the pseudomonad bacterium *Xanthomonas campestris* and believed to promote adhesion of the organism to its plant host. It is widely used in the cosmetic, food, and other industries as a crystallization inhibitor, emulsifier, gelling agent, etc.

xanthine *symbol:* Xan; 2,6-dihydroxypurine; 2,6-dioxopurine; 3,7-dihydro-1*H*-purine-2,6-dione; a purine formed in the metabolic breakdown of guanine. *Compare hypoxanthine. See also allopurinol.*

xanthine oxidase EC 1.1.3.22; *the recommended name for* hypoxanthine oxidase; *systematic name:* xanthine:oxygen oxidoreductase; *former name:* Schardinger enzyme. A flavoprotein (FAD) enzyme containing two 2Fe-2S clusters and molybdenum cofactor, abundant in milk and liver, that catalyses the oxidation of **xanthine** to urate and superoxide (or hydrogen peroxide) and also the oxidation of hypoxanthine to xanthine. The enzyme has two forms: (1) xanthine dehydrogenase, which has **NAD** as coenzyme, and urate and NADH as products; and (2) xanthine oxidase, which reacts with dioxygen and has urate and H₂O₂ as products. The dehydrogenase is converted reversibly to the oxidase by oxidation of sulfhydryl groups or irreversibly by proteolysis.

xanthinuria the excretion of excessive amounts of xanthine in the urine. It is sometimes due to a hereditary disease in which there is a gross deficiency of **xanthine oxidase** activity in the tissues. *See molybdoenzymes.*

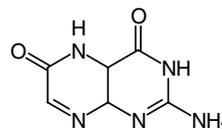

xantho+ or (*before a vowel*) **xanth+** *comb. form* denoting yellow.

xanthoma a yellow fatty deposit below the skin or associated with a tendon. Usually multiple, xanthomas are due to extravascular phagocytosis of chylomicrons, LDL-derived cholesterol, or other sterols, by macrophages of skin or subcutaneous tissue. They usually occur in a variety of hyperlipidemias and in cerebrotendinous xanthomatosis but may also occur with a normal plasma lipid profile. –**xanthomatous** *adj.*

xanthophyll any **carotenoid** in which one or more oxygenated functions are present in the molecule.

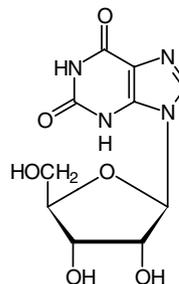

xanthoproteic test a test for protein in which a yellow colour (or precipitate from solution) forms on addition of conc. nitric acid; the colour turns orange when made alkaline.

xanthopterin a yellow pterin pigment of insect wings, e.g. of the common sulfur butterfly. *Compare leukopterin.*

xanthopterin

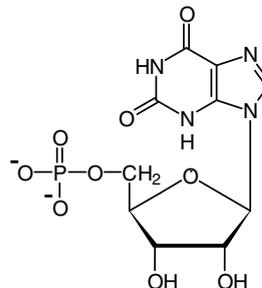

xanthosine *symbol:* X or Xao; xanthine riboside; 9- β -D-ribofuranosylxanthine; a nucleoside formed by the deamination of guanosine.

xanthosine monophosphate *abbr.:* XMP; any xanthosine phosphate, particularly xanthosine 5'-phosphate when its distinction from xanthosine (5'-)diphosphate and xanthosine (5'-)triphosphate requires emphasis.

xanthosine phosphate xanthosine monophosphate (*abbr.:* XMP); any phosphoric monoester or diester of xanthosine. Of the three possible monoesters and the two possible diesters only **xanthosine 5'-phosphate** occurs naturally (the locant being omitted if no ambiguity may arise).

xanthosine 5'-phosphate or **5'-xanthylic acid** or **5'-phosphoxanthosine** or **5'-O-phosphoxanthosine** *symbol:* Xao5'*P*; *alternative recommended names for* xanthosine monophosphate (*abbr.:* XMP); xanthosine 5'-(dihydrogen phosphate); xanthine (mono)ribonucleotide. (The locant is commonly omitted if there is no ambiguity as to the position of phosphorylation.) An intermediate in the biosynthesis of guanosine 5'-phosphate (i.e. 5'-guanylic acid, or GMP), it is formed from inosine 5'-phosphate (i.e. 5'-inosinic acid) by an NAD⁺-dependent dehydrogenase; a glutamine-requiring amidotransferase reaction (catalysed by **GMP synthase**) then converts XMP to GMP.

xanthylic acid *the trivial name for* any phosphoric monoester of xanthosine. The position of the phosphoric residue on the ribose moiety of a given ester may be specified by a prefixed locant (*see*

xanthosine phosphate). However, 5'-xanthylic acid is the ester commonly denoted, its locant usually being omitted if no ambiguity may arise.

Xao *symbol* for a residue of the ribonucleoside **xanthosine** (alternative to X).

Xao5'P *symbol* for xanthosine 5'-phosphate.

Xao5'PP *symbol* for xanthosine 5'-diphosphate (alternative to ppX).

Xao5'PPP *symbol* for xanthosine 5'-triphosphate (alternative to pppX).

Xba I a type 2 **restriction endonuclease**; recognition sequence: T[↓]CTAGA.

X box a small nucleotide sequence within the 150 bp response element of the promoter of all MHC class II genes. It binds the **RFX** complex.

X cell *see* **X-Y-Z cell theory**.

X chromosome a **sex chromosome**. It is often found paired in the **homogametic** sex, which in many species is the female, and single in the **heterogametic** sex, in many species the male. The X chromosome carries a large number of genes that control many aspects of development and function. A mutant gene so carried is called X linked. Since males possess only one X chromosome an abnormal gene that it carries cannot be paired with a normal allele; the male is then said to be hemizygous for that gene. The female with two identical members of a pair of X-linked genes is said to be homozygous for that gene; the female with one mutant gene is called a heterozygote or carrier for the abnormal allele. One X chromosome is inactivated during early embryonic development. Since the progeny of each cell have the same inactivated X chromosome, a proportion of cells have the paternal X chromosome in an active state while in the other cells the maternal X chromosome is active. Hence the female who is heterozygous for an abnormal gene will have cells with the normal gene and cells with the mutant gene. She is said to be a mosaic. *Compare* **Y chromosome**. *See also* **sex determination**.

X-chromosome inactivation or **X inactivation** the inactivation in female mammals of one of the two **X chromosomes** during early embryonic development. This phenomenon occurs randomly in cells of the female embryo, which is thus a mosaic in respect to whether it the maternal or paternal X chromosome is functional. X inactivation means that the dosage of genes in female cells is comparable with that of males, who inherit only one X chromosome. *See also* **Lyon hypothesis**.

XDP *abbr.* for xanthosine (5')-diphosphate.

Xe *symbol* for xenon.

Xeloda another name for **Capecitabine**.

Xenical (**Orlistat**) A slimming drug that acts by inhibiting lipase in the gut so that fat is not absorbed. As a result about 30% of the fat in a meal is indigested.

xenin a 25-residue peptide isolated from human gastric mucosa. The six C-terminal amino acids are identical to those of the octapeptide, **xenopsin**, present in the skin of amphibians. It stimulates exocrine pancreatic secretion, its concentration rising in plasma after a meal.

xeno+ or (*before a vowel*) **xen+** *comb. form* indicating something strange or foreign.

xenobiochemistry the biochemistry of organic compounds foreign to the organism.

xenobiotic 1 any substance that does not occur naturally but interacts with the metabolism of any organism. **2** of, or relating to, substances that are foreign to living systems.

xenobiotic-response element *abbr.*: XRE; a DNA-regulatory sequence that binds transcription factors that activate gene expression for enzymes that detoxify xenobiotics, including halogenated and other aryl hydrocarbons. *See also* **Ah**.

xenogeneic or **xenogenic** originating in a different species, especially of a tissue transplant. *See also* **xenograft**.

xenograft a tissue graft between individuals of different species.

xenologue or (*esp. US*) **xenolog** a gene acquired by horizontal transfer from another species (but not including gene transfer to eukaryotic cells from their endosymbionts, or hence from organelles to the nucleus). *Compare* **synologue**.

Xenopus laevis the South African clawed toad, the oocytes and embryos of which have been extensively exploited in molecular genetics and vertebrate embryology.

xenotope an antigenic **epitope** that is foreign to an animal.

xenotransplantation the transfer of living cells, tissues, and/or organs from one species to another, especially from nonhuman animals into humans for medical purposes. –**xenotransplant** *n., vb.*

xenotype a class or group of related **xenotypes**; i.e. an antigenic **epitope** that is foreign to a particular animal.

xeroderma pigmentosum an autosomal recessive hereditary skin disease of humans in which homozygotes show a marked tendency to develop skin cancers following exposure to sunlight. It is due to a reduced ability to excise UV-induced cyclobutane **pyrimidine dimers** from DNA.

xerophthalmia progressive drying and wrinkling of the conjunctiva of the eye. One cause is **vitamin A** deficiency.

X-gal *abbr.* for 5-bromo-4-chloro-3-indolyl- β -D-galactoside, a colourless substrate that is hydrolysed by β -galactosidase to galactose and a blue product. It is used with **cloning vectors** containing part of the *lacZ* gene to select recombinants in molecular cloning: the peptide produced by the *lacZ* fragment complements the defective β -galactosidase enzyme in host cells. Insertion of foreign DNA into the vector inactivates the *lacZ* gene, so host cells containing recombinant plasmids will grow as white colonies on medium containing X-gal, whereas host cells containing 'empty' vectors will have a functional β -galactosidase and thus produce blue colonies.

Xho I a type 2 **restriction endonuclease**; recognition sequence: C[↓]TCGAG.

Xho II a type 2 **restriction endonuclease**; recognition sequence: R[↓]GACTY.

xi *symbol*: ξ (lower case) or Ξ (upper case); the fourteenth letter of the Greek alphabet. For uses *see* **Appendix A**.

XIAP *abbr.* for X-linked inhibitor of apoptosis.

XIC *abbr.* for X inactivation centre. *See* **Xist**.

X-inactive-specific transcript *see* **Xist**.

Xiphophorus a genus of fish, that includes the South American minnow, some species of which have been much used for the study of inherited characteristics involved in carcinogenesis. Crossing of certain species, e.g. backcrossing *X. maculatus* (platyfish) with *X. helleri* (swordtail; recurrent parent) leads to spontaneous development of melanoma.

Xis protein or **excisionase** the product of the *xis* gene in lambda phage. It is essential in the excision of phage DNA from **prophage**. *See also* **integrase**.

XIST or (*in mouse*) **Xist** *abbr.* for X-inactive-specific transcript; the noncoding RNA(16 500 nt) transcript of the X inactivation centre (XIC) on the X chromosomes of female mammals. It is confined to the nucleus and associated with the heterochromatin (or Barr body) in female interphase nuclei. Xist accumulates before inactivation of the X chromosome.

XL1-Blue a proprietary strain of *E. coli* allowing blue-white colour screening for recombinants and the single-stranded rescue of phagemid DNA.

XL1-Blue MRF a proprietary strain of *E. coli* lacking K12 restriction systems and suitable for cloning methylated DNA such as that from eukaryotes.

Xma I a type 2 **restriction endonuclease**; recognition sequence: C[↓]CCGG.

XML *abbr.* for extensible markup language. *See* **markup language**.

XMP *abbr.* for xanthosine monophosphate; i.e. xanthosine (5')-phosphate.

XNU *see* **sequence filter**.

notch a transmembrane protein in *Xenopus* that is similar in sequence, and presumably in role, to the product of **notch**. It is uniformly expressed in early embryos. It contains 36 EGF-like domains and three notch-type repeats.

X-Pro dipeptidase EC 3.4.13.9; *other names*: proline dipeptidase; imidodipeptidase; prolidase; peptidase D; γ -peptidase. A cytosolic homodimeric enzyme that catalyses the hydrolysis of Xaa-[Pro] dipeptides; it also acts on aminoacyl-hydroxyproline analogues, but has no action on Pro-[Pro]. It requires manganese. Enzyme deficiency leads to imidodipeptiduria.

XPS *abbr.* for X-ray photoelectron spectroscopy; *see* **photoelectron spectroscopy**.

XPum a homologue of Pumilio, in *Xenopus laevis*.

X-ray crystallography the study of the geometric forms of crystals by **X-ray diffraction**. Myoglobin was the first protein for which the structure was solved by X-ray crystallography.

X-ray diffraction a method that uses the diffraction pattern obtained by passing X-rays through crystals, or other regular molecular arrays, to measure interatomic distances and to determine the three-dimensional arrangement of atoms (or molecules) in the structure studied. For the pattern to be sharp, the wavelength of the radiation used must be shorter than the regular spacing between the elements of the structure. X-rays typically have wavelengths of only a few tenths of a nanometre, making them suitable for biological samples. X-ray diffraction is used extensively in the determination of structures of proteins, nucleic acids, and other natural products (an early landmark was the determination of the structure of penicillin). In order to resolve the phase differences, much use has been made of **isomorphous replacement** with heavy metal atoms.

X-ray photoelectron spectroscopy *abbr.*: XPS; *see* **photoelectron spectroscopy**.

X-rays or (*sometimes, esp. US*) **x-rays** or (*formerly*) **röntgen rays** electromagnetic radiation emitted by atoms during extranuclear loss of energy of incident radiation (e.g. high-energy electrons, gamma radiation) or by atoms of certain radionuclides during transformation by **electron capture**. X-rays have wavelengths in the range 1 pm–10 nm (frequencies 3 PHz–3 EHz), which lies above that of gamma radiation and overlaps the wavelengths of the far ultraviolet. Characteristic X-rays have specific wavelengths of a particular nuclide or target element. *See also* **bremsstrahlung**, **synchrotron**.

XRE *abbr.* for xenobiotic-response element.

XTP *abbr.* for xanthosine (5′)-triphosphate.

Xul *symbol* for a residue (or a molecule) of the ketopentose xylulose.

xylo+ a variant (*sometimes before a vowel*) of **xylo+**.

Xyl *symbol* for a residue (or a molecule) of the aldopentose xylose.

xylan any homopolysaccharide of **xylose**, consisting mainly of β -1,4-linked xylopyranose units with various substituent groups, that occurs in the cell walls of higher plants, and in some marine algae. Xylans form the major glycans of the **hemicellulose** in the fibrous parts of plants.

xylaric acid the **aldaric acid** derived from **xylose**.

xyle a gene in *Escherichia coli* encoding a xylose transport protein that contains 12 transmembrane segments and is an H⁺-xylose symporter. The gene is induced by xylose. *See also* **sugar transporter**.

xylem the vascular tissue that conducts water and mineral salts from the roots to the aerial parts of a plant and provides it with mechanical support.

xylene cyanol a dye used as a mobility marker in agarose gel electrophoresis.

L-xylitol reductase EC 1.1.1.10; an enzyme of the glucuronate pathway that catalyses the reaction:

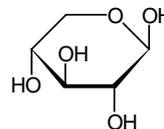

Deficiency of the enzyme results in essential pentosuria.

xylo+ or (*sometimes before a vowel*) **xylo+** *comb. form* indicating the *trivial name* for the aldopentose xylose.

xylo- *prefix (in chemical nomenclature)* indicating a particular configuration of a set of three contiguous >CHOH groups, as in the acyclic form of D- or L-xylose. *See* **monosaccharide**.

xylose *symbol*: Xyl; *xylo-*pentose; a constituent of plant polysaccharides (*see* **xylan**); the naturally occurring enantiomer is always D-xylose. In humans most ingested xylose is excreted unchanged in the urine. This is the basis for the **xylose absorption test**, the most widely used test of carbohydrate absorption.

β -D-pyranose form

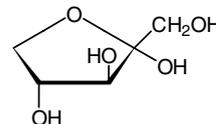

xylose isomerase EC 5.3.1.5; *systematic name*: D-xylose ketol-isomerase; an enzyme that catalyses the reaction:

magnesium ions are a cofactor. The 3-D structure is known, and it is a **beta-barrel** protein.

xylose-1-phosphate uridylyltransferase *see* **UTP-xylose-1-phosphate uridylyltransferase**.

xylulose *symbol*: Xul; *the trivial name* for the ketopentose *threo*-2-pentulose; D-xylulose is the naturally occurring enantiomer. Excessive excretion of xylulose in the urine is called essential pentosuria.

α -D-xylulose

D-xylulose 5-phosphate the 5-phosphate ester of D-xylulose and a component of the **pentose phosphate pathway**. It is formed from D-ribulose 5-phosphate by ribulose-phosphate 3-epimerase (EC 5.1.3.1); D-xylulose 5-phosphate then reacts with D-ribose 5-phosphate, catalysed by **transketolase**, to give glyceraldehyde 3-phosphate and sedoheptulose 7-phosphate.

X-Y-Z-cell theory a theory of immunocyte maturation that proposes that the first committed immunocyte, the **X cell**, is transformed by antigen into a memory cell, the **Y cell**, in the primary response, and is further stimulated in the secondary response to become an antibody producer, the **Z cell**.

Yy

y symbol for yocto+ (SI prefix denoting 10^{-24} times).

y symbol for **1** amount-of-substance fraction (i.e. mole fraction) or number fraction for gases. Compare **x**. **2** a Cartesian space coordinate, complementary to **x** and **z**.

Y symbol for **1** yotta+ (SI prefix denoting 10^{24} times). **2** a residue of the α -amino acid L-tyrosine (alternative to Tyr). **3** a residue of an incompletely specified base in a nucleic-acid sequence that may be either cytosine or thymine. **4** a residue of an unspecified pyrimidine nucleoside (alternative to Pyd). **5** a residue of the minor nucleoside **wyosine** (alternative to W). **6** yield. **7** yttrium.

Y symbol for admittance (reciprocal of impedance).

YAC abbr. for yeast artificial chromosome.

Yang cycle see methionine salvage pathway.

Yb symbol for ytterbium.

Y cell see X-Y-Z-cell.

Y chromosome a sex chromosome found only in the heterogametic sex and usually different in size from the **X chromosome**. In many animals it carries the testis-determining factor that triggers male embryonic development.

yeast any of a group of unicellular fungi that reproduce asexually – by budding or fission – and sexually – by the production of ascospores. Yeast cells may occur singly or in short chains, and some species produce a mycelium. The term ‘yeast’ is often used to mean members of the genus *Saccharomyces*, e.g. *S. cerevisiae*, which is an example of a budding yeast, or *Schizosaccharomyces pombe*, which is an example of a fission yeast.

yeast artificial chromosome abbr.: YAC; a specialized cloning vector that contains a centromere, an autonomously replicating sequence (ARS), a pair of telomeres, selectable marker genes, and the fragment of DNA to be cloned. Usually, genomic DNA is digested to produce fragments containing the genes, which are separated by pulsed field gel electrophoresis; the large fragments are then ligated into YACs. They are capable of propagation in yeasts, where they function as ‘artificial chromosomes’, being efficiently replicated. YACs are essential in large mapping projects, such as the Human Genome Project (see HUGO), as they are stable and can carry vast DNA inserts of 100 to 1000 kbp.

yeast cloning any method of cloning using yeast as the host. Expression of eukaryote genes by yeasts and other microbial eukaryotes is subject to eukaryotic regulatory systems, and the products undergo post-translational modification in contrast to when they are expressed in prokaryotes. Thus, yeast clones are often used for the expression of glycoproteins.

yeast eluate factor a former term for vitamin B₆.

yeast filtrate factor a former term for pantothenic acid. See pantothenate.

yeast nucleic acid a former term for ribonucleic acid.

yeast two-hybrid system a system that exploits two hybrid proteins, X, fused to the GAL4 DNA-binding domain, and Y, fused to the GAL4 activation domain. Plasmids encoding each of the hybrid proteins are introduced together into yeast, which leads to the expression of both hybrids. The system is used to test whether protein Y binds to protein X, for example in investigating the role of newly discovered proteins. If the proteins do bind, the resulting complex will be bound to the upstream activation sequence for the yeast GAL genes by the GAL4 DNA-binding domain, and the presence of the GAL4 activation domain will lead to transcriptional activation of the reporter gene, i.e. β -galactosidase. The system has the advantage over immunoprecipitation that if Y binds to X, the gene encoding it is already available as a clone. The hybrid containing X is referred to as the bait.

yellow enzyme 1 old yellow enzyme, EC 1.6.99.1; NADPH dehydrogenase; a flavoprotein (FMN in yeast, FAD in plants). **2** new yellow enzyme an alternative name for D-amino-acid oxidase; see amino-acid oxidase.

yellow fever virus There are two kinds of fever; **jungle** which is a disease of monkeys which is spread by infected mosquitoes; rare in humans; and **urban**, a disease of humans caused by infected mosquitoes *Aedes aegypti*. The virus is a member of the *Flaviviridae* with a sense plus RNA genome translated to a polyprotein of envelope, membrane and capsid proteins. Vaccination is by live-attenuated 17D strain.

yellow marrow see bone marrow.

Yersinia murine toxin see murine toxin.

YES v-yes is the oncogene of the Yamaguchi sarcoma virus, and has a cellular counterpart, c-yes, the product of which is a member of the *src* family of non-receptor tyrosine kinases, having a myristoylation site, and SH2, SH3 and tyrosine kinase domains.

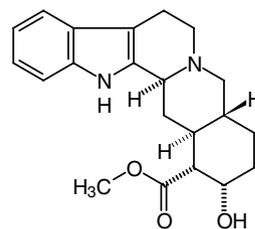

yield symbol: Y; a ratio expressing the efficiency of a mass conversion process. The yield coefficient is defined as the amount of cell mass or product formed related to the consumed substrate or to the intracellular ATP production.

yin-yang hypothesis a model of biological regulation based on the opposing actions of certain cyclic nucleotides. It arises from the observation that hormones or other biologically active substances that promote the cellular accumulation of cyclic GMP produce cellular responses that are antagonistic to ones occurring when the concentration of cyclic AMP is increased in the same tissues or cells. Hence cyclic GMP and cyclic AMP may have opposing or antagonistic regulatory influences in certain biological systems, by analogy with the oriental concept of yin and yang symbolizing a dualism between opposing natural forces.

+yl suffix (in chemical nomenclature) denoting a free valence derived from the loss of a hydrogen atom from a parent hydride, e.g. methyl, pentanyl. It also applies to particular acyl groups, that are exceptions to the rule that acyl groups are named by changing the ‘-ic acid’ or ‘-oic acid’ ending to ‘-oyl’. These exceptions are acetyl, malonyl, succinyl, propionyl, butyryl, oxalyl, and glutaryl.

yocto+ symbol: y; SI prefix denoting 10^{-24} times.

yohimbine an indole alkaloid, C₂₁H₂₆N₂O₃, with α_2 -adrenoceptor antagonist activity. It is produced by *Corynanthe johimbe* and *Rauwolfia serpentina*.

Yop abbr. for *Yersinia* outer protein; any of a number of proteins, known as virulence proteins, originally found on the surface of Gram-negative bacteria of the genus *Yersinia*; they are now known to be characteristic of plant-pathogenic proteins that are secreted by bacteria of genera as diverse as *Pseudomonas*, *Xanthomonas*, and *Erwinia*. They are also produced by animal pathogens, such as *Shigella flexneri*, *Salmonella typhimurium*, and *Escherichia coli*. They are secreted by the **type III system**. Unlike other secreted proteins, they lack a signal sequence.

yotta+ symbol: Y; SI prefix denoting 10^{24} times.

Yphantis method an alternative name for meniscus depletion method (sedimentation equilibrium).

Zz

z symbol for zepto+ (SI prefix denoting 10^{-21} times).

z symbol for **1** charge number of an ion. **2** a Cartesian space coordinate, complementary to *x* and *y*.

Z symbol for **1** zetta+ (SI prefix denoting 10^{21} times). **2** a residue of either of the α -amino acids L-glutamic acid or L-glutamine when the state of amidation is uncertain (alternative to Glx). It may also be used to represent a residue of any other substance, such as 4-carboxy-L-glutamic acid (as alternative to Gla) or 5-oxo-L-proline (as alternative to Glp), that yields glutamic acid on acid hydrolysis of peptides. **3** the **benzyloxycarbonyl** group (alternative to Cbz).

Z symbol for **1** proton number. **2** impedance.

(Z)- prefix (in chemical nomenclature) denoting a geometric isomer in which the highest priority substituent groups, determined according to the Cahn–Ingold–Prelog rules (see **sequence rule**), are located on the same side of a double bond. See also **EZ convention**.

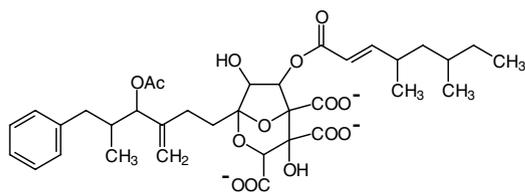

zalcitabine or **2',3'-dideoxycytidine** (abbr.: ddC); an inhibitor of reverse transcriptase that is used in the treatment of HIV-1 infection.

Zantac see **ranitidine**.

ZAP abbr. for zinc finger antiviral protein; a protein (776 amino acids) of rat that contains four zinc fingers (of C_4H type). When expressed in fibroblasts in cell culture it confers specific antiviral activity.

ZAP-70 or **zeta chain-associated tyrosine kinase** a protein-tyrosine kinase (70 kDa) that associates with the ζ subunit that functions as part of the **T-cell receptor** and **CD3** complex in lymphocytes. It contains two SH2 domains, which interact with immunoglobulin tyrosine-based motifs on ζ or other subunits of these complexes. Rare inactivating mutations in the ζ chain gene cause **severe combined immunodeficiency** (SCID).

zaragozic acid any of a family of fungal metabolites that are potent inhibitors of squalene synthase.

zaragozic acid A

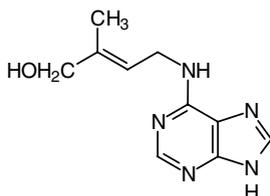

Z-average relative molecular mass see **average relative molecular mass**.

Z cell see **X-Y-Z cell theory**.

Z disk or **Z line** a platelike region of a muscle **sarcomere** to which the plus ends of actin filaments are attached. It is seen as a dark transverse line in micrographs.

Z-DNA abbr. for **Z** form of DNA.

zeatin *trans*-zeatin; (*E*)-2-methyl-4-(1*H*-purin-6-ylamino)-2-buten-1-ol; a plant hormone of the **cytokinin** class. Its derivative, *trans*-zeatin riboside (*N*⁶-(*trans*-4-hydroxy-3-methyl-*cis*-2-buten-1-yl)ad-

enosine) is also a cytokinin. The *cis* form is a rare component in some RNA structures.

zebrafish *Brachydanio rerio*; a small, highly fertile species of characinoïd teleost fish with a shiny blue body and four longitudinal yellowish stripes along its sides. It is much used in studies on the molecular biology of differentiation and development in metazoan animals.

Zeeman effect the splitting of a single line in a spectrum, indicative of the degeneration of the excited state of a particular chromophore, into two or more components of slightly different wavelengths brought about by the application of an external magnetic field. [After Pieter Zeeman (1865–1943), Dutch physicist.]

zein the principal storage protein of maize (corn) seeds. It is relatively deficient in the essential amino acids lysine and tryptophan; tryptophan deficiency can occur in human populations dependent on maize as the major protein source. The zein genes are clustered.

Zellweger syndrome or **cerebrohepato renal syndrome** a heterogeneous disorder of peroxisome biogenesis that results from mutations in at least 11 loci for PEX proteins (see **peroxin**), most commonly for PEX1. Typically patients have multiple congenital anomalies of the face and head, ongoing metabolic disturbances with accumulation of very-long-chain fatty acids, and usually die in infancy. Infantile **Refsum's disease** is one form of the syndrome. [After Hans Ulrich Zellweger (1909–1990), US paediatrician.]

zeolite any porous alkali metal- or alkaline earth-aluminium silicate that shows ion-exchange properties. Zeolites may be used for water softening or as molecular sieves. —**zeolitic** *adj.*

zepto+ symbol: z; SI prefix denoting 10^{-21} times.

zero-order kinetics kinetics shown by a **zero-order reaction**.

zero-order reaction a chemical reaction whose velocity is independent of the concentration of one or more of the reactants. See **order of reaction**.

zeroth law of thermodynamics see **thermodynamics, laws of**.

zervamicin see **peptaibolph**.

zeta symbol: ζ (lower case) or **Z** (upper case); the sixth letter of the Greek alphabet. For uses see **Appendix A**.

zeta chain 1 a transmembrane protein (16 kDa) of most T cells that contains three intracellular immunoreceptor tyrosine-based activation motifs (ITAMs) to which protein tyrosine kinases (e.g. **ZAP-70**) bind. It forms a dimer of disulfide-linked chains that are tightly associated with components of CD3 and T-cell receptors. **2** the α -globin-like globin that with γ -globin forms Hb Portland I, and with ϵ -globin forms Hb Gower I, in the first few weeks of human embryonic development. See **hemoglobin**.

zeta chain-associated tyrosine kinase an alternative name for **ZAP-70**.

zeta potential symbol: ζ ; the potential at the surface of shear of a charged particle; for macromolecular ions it is the potential at the surface of the **hydrodynamic particles** formed by such ions.

zeta protein an alternative name for cellular **fibronectin**.

zetta+ symbol: Z; SI prefix denoting 10^{21} times.

zeugmatography a technique in which the addition of carefully controlled inhomogeneous magnetic fields enables measurements of **nuclear magnetic resonance** (NMR) to be made at selected regions of heterogeneous samples and hence the formation of two-dimensional maps of the distribution of almost any property measurable by NMR.

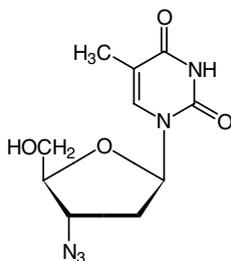

Zfn abbr. for zinc finger nuclease; a synthetic chimeric protein that contains three C_2H_2 zinc fingers and a nonspecific DNA cleavage domain.

Z form of DNA abbr. Z-DNA or DNA-Z; a form of DNA consisting of a left-handed double helix in which the pyrimidine residues are always in the *anti* orientation and the purine residues in the *syn*. So-called because of the zig-zag appearance of its conformation. See also **A form** (def. 1), **B form**, **C form**.

Zfp abbr. for zinc finger protein.

zidovudine 3'-azido-3'-deoxythymidine (abbr.: AZT); an analogue

of thymidine, the phosphorylated form of which is an inhibitor of **reverse transcriptase** in **retroviruses**; it also terminates DNA synthesis. Zidovudine undergoes phosphorylation in human T cells to a nucleoside 5'-triphosphate, which competes with thymidine triphosphate (TTP) and serves as a chain-terminating inhibitor of **HIV** reverse transcriptase. It is used clinically to treat patients with HIV infection and AIDS. *Proprietary name*: Retrovir.

Zimm–Crothers viscometer a modified **Couette viscometer** in which the inner cylinder is a self-centring float containing a steel pellet. The inner cylinder is rotated by an external rotating magnetic field, the speed of rotation being dependent, *inter alia*, on the viscosity of the fluid. The instrument only measures the viscosity of a sample relative to a standard. [After Bruno H. Zimm (1920–) US chemist and Donald M. Crothers (1937–) US biophysical chemist.]

Zimmermann reaction the reaction of *m*-nitrobenzene in strongly alkaline solution with the methylene group at position 16 in 17-kesteroids to give a purple colour with an absorption maximum at 520 nm. It may be used to estimate such steroids.

Zimm plot a graphical double extrapolation used to analyse most macromolecular light-scattering data. Measurements are made of Kc/R_θ at various concentrations as a function of the scattering angle, 2θ , where K is an optical constant, c is the concentration, and R_θ is the Rayleigh ratio. A series of plots of Kc/R_θ against $(\sin^2\theta + K'c)$ are made, where K' is an arbitrary constant chosen to provide a convenient spread. The data are then extrapolated separately to $c = 0$ and $\theta = 0$. The intersection of the two extrapolated curves yields the relative molecular mass.

zinc *symbol* Zn; a metal of group 12 of the IUPAC **periodic table**; relative atomic mass 65.38; atomic number 30. The principal ore is zincblende, ZnS. Its oxidation state is Zn(II). Zinc oxide is used as an antiseptic. Naturally occurring nuclides include (relative abundance follows each) ^{64}Zn (48%), ^{66}Zn (28%), ^{68}Zn (18%). Radionuclides include **zinc-62**, **zinc-65**, and **zinc-72**. Dietary deficiency in the rat is manifested by retarded growth, alopecia, and lesions in the skin, esophagus, and cornea. Deficiency is rare in normal individuals, but can manifest itself in alcoholics and in patients with renal disease or malabsorption. Zn^{2+} is an essential cofactor for many enzymes. Recent work suggests zinc is bactericidal.

zinc-62 the artificial radioactive nuclide ^{62}Zn ; it emits a positron (β^+ particle) (0.66 Mev) and γ -radiation of four energies (0.041, 0.25, 0.51, and 0.60 Mev). It has a half-life of 9.26 h.

zinc-65 the artificial radioactive nuclide ^{65}Zn ; it emits a positron (β^+ particle) (0.325 Mev) and γ -radiation (1.12 Mev). It has a half-life of 244.1 days.

zinc-72 the artificial radioactive nuclide ^{72}Zn ; it emits an electron (β^- particle) (0.3 Mev) and γ -radiation of three energies (0.016, 0.145, and 0.192 Mev). It has a half-life of 1.938 days.

zinc finger a polypeptide motif present in many DNA-binding proteins, and having the consensus sequence

The motif takes its name from its zinc-binding site, which forms a finger-like loop in the peptide, also described as the **Cys₂/His₂ finger**, the Cys and His residues coordinating a zinc ion. Zinc fingers are most notably present in **transcription factors** (e.g., TFIIIA and SP1), which have several repeats of the motif; they are required for binding of the transcription factor to DNA.

ZIP 1 *abbr.* for the leucine zipper domain. *See also* **bZIP**. **2** a family of membrane proteins involved in import of zinc into the cytoplasm in

eukaryotes. They are predicted to contain eight transmembrane segments, of which S4 and S8 are highly conserved and contain conserved histidine residues, which may be involved in metal binding.

Z line *another name for* **Z disk**.

Zn *symbol for* zinc.

ZNF9 a protein that contains seven zinc finger motifs, binds RNA, and is expressed in skeletal and heart muscle. Expansion of a CCTG tetranucleotide repeat in intron 1 of the gene causes myotonic dystrophy type 2.

Zollinger–Ellison syndrome a disease syndrome caused by excessive secretion of **gastrin**, either from (type 1) **G-cell** hyperplasia in the antrum of the stomach, or from (type 2) a benign or malignant pancreatic islet tumour (**gastrinoma**). The manifestations include multiple peptic ulcers, or peptic ulcers in unusual sites, with a marked tendency to bleeding, often associated with hyperparathyroidism. [After Robert M. Zollinger (1903–) and Edwin H. Ellison (1918–70).]

zona adherens *see* **desmosome**.

zonadhesin a protein of spermatozoa, probably present in the acrosome, that binds to ZP3 of the zona pellucida of mammalian ova.

zona fasciculata *see* **adrenal gland**.

zona glomerulosa *see* **adrenal gland**.

zonal centrifugation *an alternative name for* **density-gradient centrifugation**.

zonal centrifuge a centrifuge designed to allow large-scale and continuous fractionation by **density-gradient centrifugation**.

zonal rotor any centrifuge rotor of high capacity used preparatively in a **zonal centrifuge**.

zona occludens *an alternative name for* **tight junction**.

zona pellucida a layer of glycoproteins that surrounds a mammalian ovum and disappears before implantation. It is secreted by cells of the Graafian follicle. *See also* **ZP**.

zona pellucida sperm-binding protein *abbr.*: ZP; any of the sulfated transmembrane glycoproteins (ZP1, ZP2, ZP3) that together form the zona pellucida of the oocyte. ZP3 is a sperm receptor.

zona reticularis *see* **adrenal gland**.

zone electrophoresis a method of **electrophoresis** in which the protein (or other) solution is placed at the starting position as a thin band or spot in an inert supporting medium (paper, starch gel, polyacrylamide gel, etc.), containing buffer solution. An electric potential is then applied to the supporting medium, causing the proteins (or other substances) to migrate to give distinct bands or zones. These may be located *in situ* by staining, light absorption, etc., or by analysis after elution of discrete pieces of the supporting medium.

zone precipitation a technique in which protein is precipitated as a zone in a gel-filtration column by eluting with a gradient of a protein-precipitating agent. *See* **gel-permeation chromatography**.

zone spreading the broadening of a zone in electrophoresis or chromatography due to eddy currents or other disturbances in the supporting medium.

zoo blot a method for detecting conservation of DNA sequence during evolution. A segment of DNA being investigated is used as a probe to hybridize against a series of DNA samples from various species, and hence establish whether the DNA sequence has been conserved during evolution.

zoonosis (*pl.* **zoonoses**) any disease that can be transmitted to humans from other animals in natural circumstances.

zooplankton *see* **plankton**.

zootoxin any poisonous substance formed by animal cells.

Zovirax *a proprietary name for* **acyclovir**.

ZP *abbr. for* zona pellucida protein; any of three glycoproteins (ZP1, ZP2, and ZP3) present in the zona pellucida of mammalian ova. ZP3 binds the sperm proteins p47, Sp56, and zonadhesin, which may be present in the acrosome.

Zr *symbol for* zirconium.

Z ring a contractile ring of proteins that forms in the mid-region of the inner side of the plasma membrane of bacteria as part of cell division, normally towards the end of replication. Formation is initiated by **FtsZ** and depends on the presence of the **Min** system for correct localization.

Z scheme a term applied to two-system photosynthetic light reac-

tions, utilizing both **photosystems** I and II. It describes the mode of photosynthesis used by higher plants and algae, and by cyanobacteria. As it is normally plotted, with redox potential (on the ordinate) against time, it shows there is a sudden jump on excitation by a photon of a reaction centre, followed by a slow decline through electron transport components, and gives a (horizontal) Z-like appearance, hence the name.

zuotin a nuclear Z-DNA-binding protein of *Saccharomyces cerevisiae*.

zwischenferment *an obsolete term for the enzyme-coenzyme complex of glucose-6-phosphate dehydrogenase.*

Zwittergent *the proprietary name for any of a group of zwitterionic detergents containing a betaine and a sulfonate group; such molecules retain their amphoteric (zwitterionic) properties over a very wide range of pH. The formula is n-alkyl N,N-dimethyl-3-ammnio-1-propanesulfonate. In Zwittergent 3-08, alkyl is octyl (CMC 330 mm); 3-10, decyl (aggregation number 41, CMC 25–40 mm); 3-12, dodecyl (aggregation number 55, CMC 2–4 mm); 3-14, tetradecyl (aggregation number 83, CMC 0.1–0.4 mm); 3-16, hexadecyl (aggregation number 155, CMC 0.01–0.06 mm).*

zwitterion *an alternative name for dipolar ion.*

zwitterionic buffer a **buffer solution** whose acid or base component is a zwitterion (i.e. **dipolar ion**). The term is used especially of solutions of **Good buffer substances** and newer equivalents.

zygote any fertilized ovum before it has undergone cleavage. —*zygotic adj.*

zygotene the second phase of prophase I in **meiosis**.

zymase the name originally given to the heat-labile, nondiffusible fraction of a crude extract of brewers' yeast that, with the addition of the heat-stable, diffusible fraction (i.e. **cozymase**), would enable the alcoholic fermentation of glucose to occur in a cell-free system. It was later shown to consist of a mixture of enzymes, including those of the **glycolytic pathway**.

zymogen *or proenzyme or (formerly) proferment* the inactive precursor of an enzyme, often convertible to the enzyme by partial proteolysis. The term is applied especially to catalytically inactive forms of pancreatic enzymes such as trypsinogen, chymotrypsinogen, proelastase, and procarboxypeptidase; these are cleaved to release the active enzyme after their secretion from granules (**zymogen granules**) in the acinar cells of the pancreas.

zymogen granule a membrane-bound, cytoplasmic **secretory granule** visible by light microscopy. Zymogen granules are formed in the Golgi apparatus of enzyme-secreting cells and serve to store a **zymogen**. The term is used especially of a secretory granule containing the proenzyme of a digestive enzyme.

zymogram 1 any record of a **zone electrophoresis** separation in which enzymes in a sample have been separated and their positions, and relative amounts, revealed by an **activity stain. 2** any table showing the results of carbohydrate-fermentation tests carried out in the process of identifying a microorganism.

zymology the science dealing with fermentations. —*zymological adj.; zymologist n.*

zymosan a crude preparation of yeast cell walls, consisting chiefly of polysaccharide, that activates the alternative pathway of the complement system in the presence of properdin.

zymosterol cholesta-8,24-dien-3 β -ol; a sterol present in yeasts e.g. *Candida albicans*, *Saccharomyces cerevisiae*.

zymurgy the branch of chemistry dealing with the applications of fermentation processes, especially to brewing and wine-making.

Zyvox *another name for Linezolid.*

zyxin a protein component of cell substratum and cell-cell adherens junctions. It is a component of adhesion plaques and the termini of stress fibres near the point of association with the cytoplasmic face of the adhesive membrane; it interacts with α -actinin.

pi	Π	π	p
rho	Ρ	ρ	r
sigma	Σ	σ or ζ (at end of word)	s
tau	Τ	τ	t
upsilon	Υ	υ	u
phi	Φ	φ	ph
chi	Χ	χ	kh
psi	Ψ	ψ	ps
omega	Ω	ω	ō or o

Single-character symbols

α (or *α*) **1** a heavy chain of immunoglobulin A. **2** maximal agonist effect. **3** alpha particle.

α (or *α*) **1** angle of optical rotation (α_{obs} is used for observed rotation and $[\alpha]$ for specific optical rotation or specific optical rotatory power; α_{m} is used for molar optical rotatory power). **2** absorbance. **3** (linear) napierian absorption coefficient. **4** Bunsen coefficient. **5** partition coefficient. **6** plane angle. **7** (in *organic chemical nomenclature*) a locant for a substituent on the first atom from the atom carrying the principal function in an acyclic structure or in a side chain attached

to a cyclic structure. **8** an anomeric configuration (of a sugar molecule or residue; see **anomer**). **9** winding number (of a helical duplex DNA molecule).

β (or *β*) beta particle (β^- is used for an electron and β^+ for a positron).

β (or *β*) **1** buffer value. **2** pressure coefficient. **3** plane angle. **4** (in *organic chemical nomenclature*) a locant for a substituent on the second atom from the atom carrying the principal function in an acyclic structure or in a side chain attached to a cyclic structure. **5** an anomeric configuration (of a sugar molecule or residue; see **anomer**). **6** number of secondary turns (in an unconstrained helical duplex DNA molecule).

Υ (or *γ*) a heavy chain of immunoglobulin G. **2** a photon of gamma radiation. **3** (*obsolete*) microgram (μg now used).

Υ (or *γ*) activity coefficient (γ_{c} is used for activity coefficient when expressed on a concentration basis, γ_{m} when expressed on a molality basis, γ_{x} when expressed on a mole fraction basis, and γ_{\pm} is used for mean ionic activity coefficient). **2** electrical conductivity (alternative to κ or σ). **3** mass concentration or mass density (alternative to ρ). **4** plane angle. **5** surface tension or interfacial tension (alternative to σ). **6** gyromagnetic ratio. **7** (in *organic chemical nomenclature*) a locant for a substituent on the third atom from the atom carrying the principal function in an acyclic structure or in a side chain attached to a cyclic structure.

δ (or *δ*) **1** a heavy chain of immunoglobulin D. **2** (in *mathematics*) an infinitesimal change or difference.

δ (or *δ*) **1** chemical shift. **2** number fraction. **3** (in *organic chemical nomenclature*) a locant for a substituent on the fourth atom from the atom carrying the principal function in an acyclic structure or in a side chain attached to a cyclic structure.

Δ (or *Δ*) (in *mathematics*) a finite change or difference.

Δ (or *Δ*) (in *older organic chemical nomenclature*) a locant for a double bond (a right superscript number designates the lower-numbered carbon atom; see **fatty-acid nomenclature**); no longer recommended for denoting unsaturation in names of individual compounds although it may still be used in generic terms (e.g. Δ^5 -steroid) and in symbols (e.g. $\Delta_2\text{Ach}$).

ε (or *ε*) a heavy chain of immunoglobulin E.

ε (or *ε*) **1** molar (decadic) absorption coefficient. **2** permittivity (ϵ_{r} is used for relative permittivity and ϵ_0 for permittivity of vacuum). **3** (in *organic chemical nomenclature*) a locant for a substituent on the fifth atom from the atom carrying the principal function in an acyclic structure or in a side chain attached to a cyclic structure. **4** (in *chemical nomenclature*) hapticity of a ligand (less common alternative to η ; see **hapto**).

ε_a degree of activation (of an enzymic reaction).

ε_i	degree of inhibition (of an enzymic reaction).	ξ^{\cdot}	rate of conversion.
ε^{ν}_s	elasticity coefficient (of a specific enzymic step in a metabolic system).	π	(<i>or</i> π) a transcendental number that is the ratio of the circumference of a circle to its diameter (3.141 592 653 59...).
ζ	(<i>or</i> ζ) electrokinetic potential <i>or</i> zeta potential.	π	(<i>or</i> π) 1 pros. 2 (<i>or</i> π^s) surface pressure.
η	(<i>or</i> η) 1 viscosity (alternative to μ). 2 (<i>in chemical nomenclature</i>) hapticity (of a ligand; more common alternative to ε ; <i>see hapto</i>).	Π	(<i>or</i> Π) 1 osmotic pressure (Π_D may be used to represent colloid osmotic pressure). 2 binding potential (of a ligand).
θ	(<i>or</i> θ) 1 Bragg angle (<i>see</i> Bragg's law). 2 (<i>in surface chemistry</i>) contact angle. 3 plane angle. 4 torsion angle (in a linear sequence of four attached atoms; alternative to ω). 5 Celsius temperature (alternative to t).	ρ	(<i>or</i> ρ) 1 density <i>or</i> mass density (ρ_A <i>or</i> ρ_S is used for surface density). 2 mass concentration <i>or</i> mass density (alternative to γ). 3 radiant energy density (alternative to w). 4 charge density. 5 resistivity.
θ_m	melting temperature (alternative to T_m <i>or</i> t_m).	σ	(<i>or</i> σ) 1 surface tension <i>or</i> interfacial tension (alternative to γ). 2 electrical conductivity (alternative to γ <i>or</i> κ). 3 wavenumber in a medium. 4 surface charge density. 5 (<i>in surface chemistry</i>) area per molecule. 6 (<i>in nuclear magnetic resonance spectroscopy</i>) shielding constant. 7 superhelix density (of a helical duplex DNA molecule).
[θ]	molar ellipticity.	Σ	(<i>or</i> Σ) (<i>in mathematics</i>) a summation sign.
κ	(<i>or</i> κ) one type of light chain of any class of immunoglobulin (the other being λ).	τ	(<i>or</i> τ) 1 tele . 2 bond angle. 3 relaxation time <i>or</i> time constant (alternative to T). 4 transmittance <i>or</i> transmission factor (alternative to T). 5 mean life. 6 number of superhelical turns (in a helical duplex DNA molecule).
κ	(<i>or</i> κ) 1 electrical conductivity (alternative to γ <i>or</i> σ). 2 electrolytic conductivity <i>or</i> (<i>formerly</i>) specific conductance. 3 molar napierian absorption coefficient. 4 magnetic susceptibility (alternative to χ). 5 (<i>in inorganic chemical nomenclature</i>) an affix in the name of a polydentate chelate complex indicating single attachments of a polydentate ligand to a coordination centre. A right superscript numerical index indicates the number of such attachments.	φ	(<i>or</i> ϕ) 1 osmotic coefficient (ϕ_m is used for osmotic coefficient when expressed on a molality basis and ϕ_x when expressed on a mole fraction basis). 2 electric potential (alternative to V). 3 fluidity. 4 plane angle. 5 phase difference. 6 volume fraction. 7 Dalziel coefficient. 8 torsion angle (from the anomeric carbon atom to the oxygen atom of a glycosidic bond). 9 quantum yield (alternative to Φ). 10 winding angle (of intercalated helical DNA).
λ	(<i>or</i> λ) 1 one type of light chain of any class of immunoglobulin (the other being κ). 2 (<i>obsolete</i>) microlitre (μl now used).	Φ	(<i>or</i> Φ) 1 heat flow rate. 2 radiant power <i>or</i> radiant (energy) flux (alternative to P). 3 magnetic flux. 4 potential energy (alternative to E_p <i>or</i> V). 5 quantum yield (alternative to ϕ).
λ	(<i>or</i> λ) 1 (<i>in thermodynamics</i>) absolute activity (<i>see</i> activity , def. 4). 2 disintegration constant <i>or</i> decay constant. 3 wavelength. 4 thermal conductivity (alternative to k).	χ	(<i>or</i> χ) 1 electronegativity. 2 magnetic susceptibility (alternative to κ ; χ_m is sometimes used, but it should be reserved for molar magnetic susceptibility). 3 surface electric potential. 4 exocyclic torsion angle (in a sugar residue).
A	(<i>or</i> A) molar conductivity (of an electrolyte).	ψ	(<i>or</i> ψ) 1 replacement of the $-\text{CO}-\text{NH}-$ group in a peptide by another (indicated) grouping. 2 torsion angle (from the oxygen atom of a glycosidic bond to the glycosylated molecule). 3 wavefunction (alternative to Ψ).
μ	(<i>or</i> μ) a heavy chain of immunoglobulin M. 2 micro+ (SI prefix denoting 10^{-6} times). 3 (<i>obsolete</i>) micron (now called micrometre; symbol: μm).	Ψ	(<i>or</i> Ψ) 1 a residue of the ribonucleoside pseudouridine (alternative to Ψrd). 2 electric flux. 3 wave function (alternative to ψ).
μ	(<i>or</i> μ) 1 (<i>in chemical nomenclature</i>) a bridging ligand. 2 viscosity (alternative to η). 3 chemical potential (μ° <i>or</i> μ^\ominus is used for standard chemical potential and μ^\sim is used for electrochemical potential). 4 electric mobility (alternative to u). 5 (<i>in magnetism</i>) permeability (μ_r is used for relative permeability). 6 magnetic dipole moment (bold italic) (alternative to m). 7 electric dipole moment (bold italic) (alternative to p).	ω	(<i>or</i> ω) 1 angular frequency. 2 angular velocity. 3 solid angle. 4 torsion angle (in a linear assembly of four attached atoms; alternative to θ). 5 (<i>in organic chemical nomenclature</i>) a locant for the terminal atom <i>or</i> group in an acyclic organic compound. 6 (<i>in notation for polyunsaturated fatty acids</i>) ω - x signifies that a double bond is located on the x th carbon; unlike standard chemical nomenclature it is counted from the distal (methyl carbon) atom.
μ_0	permeability of vacuum (a fundamental physical constant).	Ω	(<i>or</i> Ω) ohm.
μ_B	Bohr magneton (a fundamental physical constant).	Ω	(<i>or</i> Ω) solid angle.
μ_e	electron magnetic moment (a fundamental physical constant).		
μ_N	nuclear magneton (a fundamental physical constant).		
μ_p	proton magnetic moment (a fundamental physical constant).		
ν	(<i>or</i> ν) 1 stoichiometric number (of a chemical reactant). 2 frequency (alternative to f for electromagnetic radiation). 3 kinematic viscosity. 4 endocyclic torsion angle (in a sugar residue).		
ξ	1 (<i>in inorganic chemical nomenclature</i>) unknown configuration at a chiral centre. 2 extent of reaction.		

Multi-character biochemical symbols commencing with a Greek character

αLnn	the linolenoyl or (9,12,15)-linolenoyl or (formerly) α -linolenoyl (i.e. (<i>all-Z</i>)-octadeca-9,12,15-trienoyl) group (alternative to Lnn).	Δ_2Ach	the (<i>all-Z</i>)-eicosa-8,11-dienoyl group.
βAad	a residue of the β -amino acid L- β -aminoadipic acid (i.e. L-3-aminohexanedioic acid).	Δ_3Ach	the (<i>all-Z</i>)-eicosa-5,8,11-trienoyl group.
βAla	a residue of the β -amino acid β -alanine (i.e. 3-amino-propanoic acid).	Δ_4Ach	the arachidonoyl (i.e. (<i>all-Z</i>)-eicosa-5,8,11,14-tetraenoyl) group.
γLnn	the (6,9,12)-linolenoyl or (formerly) γ -linolenoyl (i.e. (<i>all-Z</i>)-octadeca-6,9,12-trienoyl) group.	ΔPam	the palmitoleoyl (i.e. (<i>Z</i>)-hexadec-9-enoyl) group.
		εAcp	see εAhx .
		εAhx	or (formerly) εAcp a residue of the ε -amino acid 6-aminohexanoic acid (formerly known as ε -aminocaproic acid).
		Ψrd	a residue of the ribonucleoside pseudouridine (alternative to Ψ).

Appendix B

Sequence-rule priorities

The names of some common ligands are listed alphabetically below, the numbers preceding them indicating the relative priorities assigned to the ligands under the **sequence rule**. A higher number denotes greater preference; for example, a hydroxy group (numbered 57) takes precedence over an amino group (numbered 43). It should be noted that any change to the structure of a listed ligand may alter the order of preference. Where a ligand consists of or contains a heavy or radioactive isotope of hydrogen, the relative priorities are tritium > deuterium > protium. Racemates with a single chiral centre are labelled (*RS*); extensions of the sequence rule are used in the *E/Z*, *pro-R/pro-S*, *pro-E/pro-Z*, and *Re/Si* nomenclature systems.

64	acetoxy	59	ethoxy	70	methylthio (CH ₃ S ⁻)
36	acetyl	40	ethoxycarbonyl	11	neopentyl
48	acetylamino	13	ethyl	56	nitro
21	acetylenyl	46	ethylamino	27	<i>m</i> -nitrophenyl
10	allyl	68	fluoro	33	<i>o</i> -nitrophenyl
43	amino	35	formyl	24	<i>p</i> -nitrophenyl
44	ammonio (⁺ H ₃ N ⁻)	63	formyloxy	55	nitroso
37	benzoyl	62	glycosyloxy	16	pentyl
49	benzoylamino	17	hexyl	61	phenoxy
65	benzoyloxy	11	hydrogen	22	phenyl
13	benzyl	57	hydroxy	47	phenylamino
60	benzyloxy	76	iodo	54	phenylazo
41	benzyloxycarbonyl	19	isobutyl	18	propenyl
50	benzyloxycarbonylamino	18	isopentyl	14	propyl
75	bromo	20	isopropenyl	29	1-propynyl
42	<i>tert</i> -butoxycarbonyl	14	isopropyl	12	2-propynyl
15	butyl	69	mercapto (HS ⁻)	73	sulfo (HO ₃ S ⁻)
16	<i>sec</i> -butyl	58	methoxy	25	<i>m</i> -tolyl
19	<i>tert</i> -butyl	39	methoxycarbonyl	30	<i>o</i> -tolyl
38	carboxy	12	methyl	23	<i>p</i> -tolyl
74	chloro	45	methylamino	53	trimethylammonio
17	cyclohexyl	71	methylsulfinyl	32	trityl
52	diethylamino	66	methylsulfinyloxy	15	vinyl
51	dimethylamino	72	methylsulfonyl	31	2,6-xylyl
34	2,4-dinitrophenyl	67	methylsulfonyloxy	26	3,5-xylyl
28	3,5-dinitrophenyl

SI base units

Physical quantity	Name of SI unit	Symbol for SI unit
Length	metre	m
Mass	kilogram	kg
Time	second	s
Electric current	ampere	A
Thermodynamic temperature	kelvin	K
Amount of substance	mole	mol
Luminous intensity	candela	cd

SI prefixes

Submultiple	Prefix	Symbol	Multiple	Prefix	Symbol
10 ⁻¹	deci	d	10	deca	da
10 ⁻²	centi	c	10 ²	hecto	h
10 ⁻³	milli	m	10 ³	kilo	k
10 ⁻⁶	micro	μ	10 ⁶	mega	M
10 ⁻⁹	nano	n	10 ⁹	giga	G
10 ⁻¹²	pico	p	10 ¹²	tera	T
10 ⁻¹⁵	femto	f	10 ¹⁵	peta	P
10 ⁻¹⁸	atto	a	10 ¹⁸	exa	E
10 ⁻²¹	zepto	z	10 ²¹	zetta	Z
10 ⁻²⁴	yocto	y	10 ²⁴	yotta	Y

Prefix symbols should be printed in roman type with no space between the prefix and the unit symbol. Prefixes should not be combined into compound prefixes.

Single-letter and three-letter symbols for amino acids

Amino acid	One letter	Three letter
Alanine	A	Ala
Arginine	R	Arg
Asparagine	N	Asn
Aspartic acid	D	Asp
Cysteine	C	Cys
Glutamine	Q	Gln
Glutamic acid	E	Glu
Glycine	G	Gly
Histidine	H	His
Isoleucine	I	Ile
Leucine	L	Leu
Lysine	K	Lys
Methionine	M	Met
Phenylalanine	F	Phe
Proline	P	Pro
Serine	S	Ser
Threonine	T	Thr
Tryptophan	W	Trp
Tyrosine	Y	Tyr
Valine	V	Val
Unspecified or unknown	X	Xaa

SI derived units with special names

Physical quantity	Name of SI unit	Symbol for SI unit	Expression in terms of SI base units
Absorbed dose (of radiation)	gray	Gy	J kg ⁻¹ = m ² s ⁻²
Activity (radioactive)	becquerel	Bq	s ⁻¹
Catalytic activity	katal	kat	mol s ⁻¹
Celsius temperature	degree Celsius	°C	K
Dose equivalent (dose equivalent index)	sievert	Sv	J kg ⁻¹ = m ² s ⁻²
Electric capacitance	farad	F	C V ⁻¹ = m ⁻² kg ⁻¹ s ⁴ A ²
Electric charge	coulomb	C	A s
Electric conductance	siemens	S	Ω ⁻¹ = m ⁻² kg ⁻¹ s ³ A ²
Electric potential, electromotive force	volt	V	J C ⁻¹ = m ² kg s ⁻³ A ⁻¹
Electric resistance	ohm	Ω	V A ⁻¹ = m ² kg s ⁻³ A ⁻²
Energy, work, heat	joule	J	N m = m ² kg s ⁻²
Force	newton	N	m kg s ⁻²
Frequency	hertz	Hz	s ⁻¹
Illuminance	lux	lx	cd sr m ⁻²
Inductance	henry	H	V A ⁻¹ s = m ² kg s ⁻² A ⁻²
Luminous flux	lumen	lm	cd sr
Magnetic flux	weber	Wb	V s = m ² kg s ⁻² A ⁻¹
Magnetic flux density	tesla	T	V s m ⁻² = kg s ⁻² A ⁻¹
Plane angle*	radian	rad	1 = m m ⁻¹
Power, radiant flux	watt	W	J s ⁻¹ = m ² kg s ⁻³
Pressure, stress	pascal	Pa	N m ⁻² = m ⁻¹ kg s ⁻²
Solid angle*	steradian	sr	1 = m ² m ⁻²

* The units radian and steradian are also known as 'SI supplementary units'. Names of units, even those derived from proper names, should be printed with lower-case initial letters. Symbols for units should be printed in roman type.

The genetic code

5' base	Middle base				3' base
	U	C	A	G	
U	UUU Phe	UCU Ser	UAU Tyr	UGU Cys	U
	UUC Phe	UCC Ser	UAC Tyr	UGC Cys	C
	UUA Leu	UCA Ser	UAA Ter*	UGA Ter*/Sec A	A
	UUG Leu	UCG Ser	UAG Ter*	UGG Trp	G
C	CUU Leu	CCU Pro	CAU His	CGU Arg	U
	CUC Leu	CCC Pro	CAC His	CGC Arg	C
	CUA Leu	CCA Pro	CAA Gln	CGA Arg	A
	CUG Leu	CCG Pro	CAG Gln	CGG Arg	G
A	AUU Ile	ACU Thr	AAU Asn	AGU Ser	U
	AUC Ile	ACC Thr	AAC Asn	AGC Ser	C
	AUA Ile	ACA Thr	AAA Lys	AGA Arg	A
	AUG Met [†]	ACG Thr	AAG Lys	AGG Arg	G
G	GUU Val	GCU Ala	GAU Asp	GGU Gly	U
	GUC Val	GCC Ala	GAC Asp	GGC Gly	C
	GUA Val	GCA Ala	GAA Glu	GGA Gly	A
	GUG Val	GCG Ala	GAG Glu	GGG Gly	G

*Termination codons have no amino acids assigned to them, except that UGA can be the code for Sec; see selenocysteine insertion sequence.

[†]The AUG codon is the usual initiation codon as well as that for methionine residues elsewhere. The code is almost universal but differences have been found in mitochondrial DNA from some organisms (see the genetic code entry).
